50 MONSTER MAXIMIZERS

by Brian Corvello

Many AD&D® game monsters come from popular mythology, folklore, and fairy tales. The game statistics for these creatures, however, only scratch the surface of the original mythology. A zombie can be much more than a mindless undead soldier according to Caribbean folklore.

Here are fifty bits of forgotten lore, each with an optional rule for the AD&D version of the monster.

illustrated by
Pete Venters

1 The haunting wail of a **BANSHEE** is an omen of death. If a family with a sick member hears the eerie sound, they can be sure the person will not survive. If the banshee is fought and defeated, however, the sick individual recovers completely.

A terminally diseased character dying in his or her home town has a 5% chance per level of attracting a banshee. The spirit wails a harmless but chilling cry every night until the character dies. If the banshee is slain during this time, the sick person is affected by a *cure disease* spell cast at 12th level.

2 The stupid **CATOBLEPAS** is a spirit of gluttony. Not only does it eat any creature it slays with its deadly gaze, but also it eats its own forelegs and tail if food is scarce. This is of little consequence to the monster, as the limbs soon grow back.

A catoblepas cannot regenerate in combat, but it can regrow a lost limb or tail in 2d6 days.

3 The race of **CENTAURS** is divided into two main families. One branch, the Descendants of Ixion, combine the speed and strength of a horse with the greed and arrogance of humans. These centaurs have gone bad and indulge in endless debauchery. They give allegiance only to the Greek god of wine, Dionysus.

Descendants of Ixion are chaotic neutral and have Low to Average Intelligence. They can become priests of Dionysus, up to 5th level.

4 The other family of **CENTAURS** is known as the Descendants of Chronus. These noble centaurs are far more wise, intelligent, and benign than their cousins, and they pursue a sober life filled with study. Many have educated a number of heroes.

Descendants of Chronos are chaotic good and have Intelligence scores ranging from 11 to 15. They can become priests or druids of any good deity, up to 8th level.

5 An effective antidote for the petrifying touch of the **COCKATRICE** is the rue leaf. Rubbing rue leaves on the stone body of one of the monster's victims restores the victim to flesh and heals any wounds inflicted by the creature.

A restored victim must survive a System Shock roll. Also, the leaves heal only the damage caused by the cockatrice. Eating the leaves has the same effect.

6 The **COCKATRICE's** deadliest enemy is the rooster. The monster never goes near a place inhabited by these birds, as the sound of the rooster's crow causes it to fall dead. The rooster knows this by instinct and always starts crowing when it sees the monster.

The cockatrice is allowed a saving throw vs. death magic; otherwise, the sound of the rooster kills it.

7 Another mortal enemy of the **COCKATRICE** is the weasel. Weasels are immune to the monster's petrifying touch and attack the beast without mercy. The cockatrice fights back with its sharp beak, but weasels are instinctively aware of the healing power of rue, which they usually know where to find. The weasel usually wins a fight with the cockatrice.

This hatred and immunity extends to giant weasels. Both normal and giant varieties never check morale when confronted with a cockatrice.

8 Some **DWARVES** have the ability to see the future. However, these dwarves tend to be recluses and rarely, if ever, use their ability for the good of other races.

At most, 2% of dwarf NPCs have this ability; PC dwarves never do. Such dwarves are true neutral, inhabit remote locations, and can see three days into the future for every level they have obtained. Most are 9th level or higher.

A wizard of great skill. He is a notorious lover, and traces of his elven blood can be found in many communities. He is also an incurable prankster who loves to play jokes. One of his favorite tricks is to impersonate a rich man's favorite riding horse, wait to be mounted, and dump him in a stream.

Robin Goodfellow is a 17th-level chaotic good transmuter. He has been given a gift of immortality by his father—though he can be killed, he does not age. He can often be found in sylvan settings, but only when he desires it.

9 **NEREIDS** are exceedingly vain and accept no comparisons to their beauty. When the queen Cassiopeia bragged that her daughter Andromeda was more beautiful than the nereids, they petitioned Poseidon to punish the queen. The sea god demanded that Andromeda be sacrificed to a sea monster called Cetus. Fortunately, Cetus was slain the hero Perseus.

Only evil nereids are likely to retaliate this way. It might be possible for PCs to manipulate a nereid with flattery, but nereids are allowed a Wisdom check to realize they are being flattered. (Treat a nereid's Wisdom score as equal to her Intelligence).

10 When an **ELEPHANT** knows it is about to die of old age, it travels to one of several hidden groves known as Elephant Graveyards. Once it arrives, it finds a spot amid hundreds of skeletons, takes one last look at life, and dies. Many have tried to follow an old elephant to one of these spots, hoping to claim a fortune in ivory tusks, but elephants are crafty, and most would sooner die in combat than lead a human to the bones of its ancestors.

Should a PC try to follow such a dying elephant, the animal attacks without checking morale if it detects the PC. Should a PC actually make it to a Graveyard, it will indeed yield ivory—at least 10,000 gp worth—but the places are always well trapped and guarded. Several bone golems patrolling the graveyard would not be unusual.

11 One **HALF-ELF** of widely recognized fame is Robin Goodfellow. Robin was the son of a mortal woman and an avatar of Oberon. Robin soon developed a knack for shapeshifting magic and became a

12 Some **GRIFFONS** delight in punishing the greedy. They often lure treasure hunters to their nests and tear them to pieces. If one can defeat such a griffon, the treasure is rich indeed.

These horde-watching griffons could have a treasure type of up to F.

13 The reason **GRIFFONS** delight in eating horses is that they see them as competitors in riding and chariot drawing. Horses are too weak to stand up for themselves, but an intelligent equine—like a unicorn or pegasus—will seldom miss an opportunity to hinder or embarrass a griffon.

14 **HAGS** can be identified by the lair they keep. An annis lair is always a cave with a large pile of bones at the entrance, on which the hag often sits. The bones of anyone foolish enough to come near are soon added to the pile. However, if a sizeable group gathers to hunt her down, the creature usually abandons the lair. Close inspection of the bones shows that she often has to content herself with a diet of sheep and deer when humans aren't available.

At the DM's option, this pile may also be where the monster stores treasure.

15 The gluttonous **HARPIES** often act as agents of the gods. When a mortal offends a deity, the god might send these beasts to attack at a time when a meal is served. The harpies proceed to devour the offender's meal, repeating the attack every day until they are slain or the offender starves to death.

A priest who offends a deity whose area of influence includes nature, charity, or the harvest has a 5% to 50% chance of receiving this punishment, the probability depending on the severity of the offense.

16 **HARPIES** that dwell on coast lines are notoriously sore losers. If a ship does not succumb to their hypnotic singing, they might commit suicide by tossing themselves into the sea.

There is a 5% cumulative chance per defeat that a group of harpies does this. PCs might gain XP awards for it, depending on how clever they were in avoiding the *charm*.

17 Some **HYDRAE** are so venomous that they poison the air around them. Even the hero Heracles nearly succumbed to the poisonous stench of the Lernaean hydra he fought. It would be folly to think that a lesser person could stand up to one.

One in every ten hydrae has a poisonous aura. Every round spent within 20 feet of these hydrae causes 1d6 points damage unless a saving throw vs. poison succeeds. Any water touched by them becomes poison; those who drink it must make a successful saving throw vs. poison or die instantly.

18 **HYDRAE** never sleep; they have a constant activity cycle. This makes *charmed* hydrae excellent guardians for the treasures of kings or even gods. Two treasures known to have been guarded by hydrae are the Golden Fleece and the Golden Apple Tree, planted by Zeus at the End of the World. (This means hydrae are unaffected by magical and poisonous affects that cause sleep.)

19 In a fairy community, **LEPRECHAUNS** often serve as cobblers, making shoes for brownies, pixies, and other fairies. If one hears a faint tapping in sylvan woods, it might be one of these creatures pounding nails into a tiny shoe. When actually seen, the leprechaun has only one shoe in his possession; he hides the other in case he must escape when a mortal sees him.

At the DM's option, leprechauns might be able to construct magical shoes and boots, such as *boots of elvenkind*. The fairies can be persuaded to do this by payment of gold equal to the magical item's worth.

21 The **LION** is the natural enemy of the unicorn. When the two creatures meet, they compete for dominance of the land. Lions always attack unicorns, who return the favor. Unfortunately, the two evenly matched creatures often wind up killing each other.

A lion never checks morale when dealing with a unicorn. It attacks on sight and does not give up until one of them is dead or the unicorn somehow escapes.

22 One **LION** of note was fought by the demigod Heracles at Nemea. The son of a monster called Typhoeus, the Namean lion had skin tougher than steel. Heracles killed the beast by strangling it, but it might have fathered offspring. The lion's skin was used as invulnerable armor for the demigod, aiding him in all further endeavors.

Descendants of the Namean lion have 7 HD and AC -4. Their skin can be made into *leather armor* +2.

23 In tropical rain forests, the **MANTICORE** often poisons its spines with the juice of the *upas* tree, a plant notorious for its venomous sap. Death is immediate for prey struck by these spines, and the victims are devoured at the monster's leisure. The manticore itself is immune to *upas* poison.

Anyone struck by *upas* poison must make a successful saving throw vs. poison or die instantly. On the plus side, the tree's poison can be used by anyone, though it becomes inert after 1d6 days.

20 **LEPRECHAUNS** carry magical snuff-boxes that serve as effective weapons. If caught by a human or demihuman assailant, a leprechaun throws the snuff into the attacker's face; by the time the attacker recovers from sneezing, the leprechaun has vanished.

Those hit by a leprechaun's snuff box, which requires a normal attack roll, must make a successful saving throw vs. spell or collapse into a fit of helpless sneezing for 2 rounds.

24 When a **MANTICORE** feeds, it uses its mighty teeth to crunch up every portion of the corpse. Bones, clothing, and even armor are devoured by the greedy monster. The complete disappearance of a person in the wilderness might be an indication of a manticore's presence.

Manticores leave nothing left of their victims to raise or resurrect.

25 The original **MEDUSA** (as well as her sisters, Stheno and Euryale) had fanlike wings that allowed her to fly like the wind. When Perseus killed Medusa, he would surely have fallen prey to her sisters had not the first pegasus

sprung from her neck; Perseus mounted the steed and escaped. It is not known whether Stheno or Euryale produced offspring, but if they did, some of their descendants might be winged.

Winged medusae fly at a speed of 24, Maneuverability Class D. Greater medusae never have these appendages.

26 A serpentine lock of a **MEDUSA** hair is considered an infallible protection against those who seek to control one's mind. Most would argue, however, that obtaining this protection is far more dangerous than fighting an enchanter.

Anyone carrying medusa hair gains a +4 bonus to saving throws vs. Enchantment/Charm magic.

27 **MERFOLK** can predict the weather of the sea accurately. A sailor who befriends these folk can ask them for help. Merfolk aid sailors in this manner as long as their skills aren't squandered on greedy ventures.

Merfolk can predict the weather with 80% accuracy, but only weather over the sea.

28 **MERMAIDS** can throw powerful curses at sailors who offend them. Possible offenses include spying on them, lusting after their beauty, refusing their aid, or especially—trying to cheat them in any way. A fisherman who cheats a mermaid might never catch another fish, and a ship commander who harms one certainly loses his next battle. A mermaid's curse is powerful. One can be removed only by performing an act of atonement to the merfolk. DMs should be fiendish in devising punishments for those who cheat the mermaids.

This manticore cleans its teeth on the bones of slain victims.

29 **MINOTAURS** are also used occasionally as divine retribution. When a ruler offends a deity badly, he might find that one of his cows gives birth to a minotaur. Since this beast eats only human flesh, the despot must sacrifice humans to the beast until it is killed. (Slaying the minotaur would only invoke more punishments from the gods.)

Only an evil power would saddle someone with this punishment, and even then the crime would have to be a great one.

30 One famous **SPIRIT NAGA** was known as the Lambton Worm. This creature possessed an amazing regenerative power that allowed it to put itself back together even after being hacked to pieces. A warrior defeated this monster by wearing razor-studded armor and fighting it in a river (before they could rebond, the pieces were washed away), but the

Worm was surely not the only member of this branch of the family.

A "Lambton" spirit naga can regenerate at the rate of 4 hp per round, and severed parts can reattach themselves by slithering together. Damage from fire and acid cannot be regenerated.

31 Many believe that the beautiful **NYMPHS** are immortal spirits, but this is not so.

Nymphs are long lived, however: Their typical life span is ten thousand human generations. Though they can be a wealth of information, nymphs have been known to trouble mortals with mischief when they have too much time on their hands.

Often (50% of the time), a bored nymph will trouble PCs with druid spells or other forest inhabitants. While causing trouble like this, they never show themselves.

32 **NYMPHS** have been known to succumb to dangerous levels of alcohol consumption, especially when celebrating with satyrs. A band of drunk nymphs are a dangerous mob, tearing apart any unlucky creature who runs into them.

Drunken nymphs are considered temporarily chaotic neutral. If provoked, they attack with their hands, inflicting 1d4 points of damage and using sheer numbers to overbear lone opponents. Victims must still make a successful saving throw vs. spell to avoid blindness or death upon seeing them, but with a +2 bonus.

The Ecology of the Aboleth

The type best known is also the least dangerous

by **Brandon Grist**

The following information on aboleth is based on testimony given to a group of adventurers by the dark-elf sage Alzor, just hours before his mysterious disappearance. Alzor was known to be fair and honest, and his information about the Underdark and its denizens had always been reliable.

The aboleth are perhaps the least well-known and the most misunderstood of all the races which inhabit the Underdark. The reason for this is very simple — the aboleth want it that way. The bulk of their population dwells in seclusion in the great, sunless seas found deep beneath the surface of the earth. Only the weakest aboleth are encountered near the surface, and it is from these creatures that the vast majority of surface-dwellers have drawn what little knowledge they have of this race. Because of the unfortunate misconceptions which arise from this practice, it is necessary to explain the true nature of the aboleth.

In general, all aboleth are cruel, emotionless, and logical. All are extremely intelligent — some even more so than the most ancient of elven mages. They are believed to live for thousands of years, but exact information is difficult to gain for obvious reasons.¹ Over their many years of existence, the aboleth have developed a society which far exceeds that of man in its efficiency. In this society, each aboleth has a specific duty which it performs with the utmost skill. There are four major roles in the aboleth society. In increasing order of importance, these roles are: slave-gathering, slave maintenance, scientific research and experimentation, and ruling.

The role of slave-gathering is delegated to the common aboleth with which most surface-dwellers are familiar.² Such an aboleth resembles a large, blue-green fish which lacks all fins but the caudal. It has a head with three large, slitlike eyes and four long tentacles. Its mouth is like a great sucker and can be found on the underside of the head section. On each of its sides can be found four tubelike orifices which excrete a vile slime. This common aboleth is about 20' long from tail to head, and has 10'-long tentacles. It is clumsy on land and is usually encountered in underground lakes. Despite its good combat abilities, this creature prefers to attack with a mental ability which allows it to *enslave* those with weak minds. It also possesses illusion-casting abilities used to hide itself while hunting for slaves. In general, it is wise not to get close to one of these creatures, for not only is the slime they excrete hazardous to all air-breathing creatures, but their very skin can cause serious tissue damage if touched to exposed flesh. It is important to note that these slave-gathering monsters are also the *weakest* of their kind.

Slaves gathered by the common aboleth are routinely brought back to certain floating cities in these underground seas in which the more powerful aboleth dwell.³ This collection process, along with further maintenance of slaves, is the responsibility of the greater aboleth. These creatures resemble their lesser brothers in every way, but are considerably larger. They average 30' in length and weigh several tons. They are also more intelligent than the common aboleth. They have most of the same powers possessed by the common aboleth, but their *enslavement* ability is more developed. Generally speaking,

anyone *enslaved* by one of these creatures never sees the upper world again. There may be as many as a dozen of these creatures in a single aboleth city, each maintaining a separate group of slaves.

The purpose of slaves in the aboleth society is quite different from what would normally be expected. Though slaves may have been used originally to aid in the construction of aboleth cities, these cities generally lack any kind of significant slave population. Instead, most slaves dwell on the shores of the lakes on which the cities float. There, the slaves serve both as guards and as playthings for the cruel aboleth, who pit slaves against one another in strange spectacles of combat. The exact purpose of this practice is not clear, though it may be a way of eliminating the weak in the breeding of a race of subterranean slaves.

In order to fully understand the next major class in aboleth society, that of the noble, it is first necessary to establish the point that the aboleth have chosen the path of science over that of magic. Consequently, they have no wizards or conjurers as do other races. Noble aboleth, the scientists of the race, are fantastically intelligent and ever seek to increase their powers through bizarre means.⁴ In general, they are similar in appearance to the common aboleth. Unlike common aboleth, noble aboleth have an enlarged head section, and they have two slender arms, each ending in three highly dextrous fingers, instead of their two uppermost tentacles. These latter appendages are used for more delicate work.⁵ These scientist-types possess most of the other abilities common to aboleth, as well as a few mental powers which are useful in their research. Though the full extent of the aboleth's scientific knowledge can only be guessed at, it is certain that it is, at the very least, comparable to the magical knowledge possessed by the dwellers of the upper world. Each city usually holds about half a dozen of these noble aboleth.

The last major role in aboleth society is that of command, which is the responsibility of the greatest class of aboleth. Physically, ruler aboleth resemble common aboleth, but each is about 40' long and more intelligent than even the nobles. Each city has but one ruler, and it is his job to maintain order. To better accomplish this, the ruler has some sort of mental link with all of his subjects.⁶ As their knowledge increases, so does the ruler's. Rulers possess all other aboleth abilities and should be regarded as dangerous in the extreme.

An aboleth feeds mainly on microscopic organisms which abound in its natural habitat, but it can also consume larger prey if necessary.⁷ Aboleth can survive in both air and water, but prefer water for obvious reasons. Every aboleth has both male and female reproductive organs, though mating is rare and is restricted between aboleth of the same class.⁸

Because of their nonmagical nature, aboleth have a measure of resistance to spells similar to the spell-resistance of dwarves. This resistance grows greater as the aboleth's size and power increase.⁹ All aboleth have psionic powers commensurate with their level of intelligence, and the most intelligent have powers which rival those of the illithids who, like all of the other subterranean races, have a healthy fear of the aboleth.

In closing, it is worthy to note that rumors exist of a grand aboleth, a creature so immense that it dwarfs even the rulers. If so, then perhaps it is better that surface and subterranean dwellers alike leave the aboleth to do as they please.

Notes

1. Common aboleth have a life span of about 2,000 years. Greater and noble aboleth live to be about 3,000 years old. Rulers can live as long as five millennia, while the grand aboleth may well be immortal.

2. The common aboleth is simply the monster as outlined in the *Monster Manual II*, with slight modifications as noted herein. The illusion-casting power mentioned in this paragraph is equal to the ability to cast *phantasmal force* (with auditory effects as well as visual ones) at will, once per round.

3. When a common aboleth enslaves a total of seven creatures (regardless of their hit dice), a greater and noble aboleth arrive using *probability travel* and take the slaves back to their city. Each greater aboleth has as many as five common aboleth gathering slaves for it. It takes from 2-8 turns for the greater and noble aboleth to arrive, though they are alerted immediately by *telepathy* when the quota is met.

4. Nobles use their ability of *probability travel*, as well as many strange drugs and devices, to travel to alternate Prime Material planes. There they amass as much knowledge as possible while *enslaving* any who oppose them. Occasionally, several nobles and a dozen or so common aboleth mount a raid into a particularly promising world, but this is rare.

5. These appendages are also capable of using technological items. The aboleth nobles have developed several potent offensive weapons and do not hesitate to use them if they feel the need exists. Note that they do not care for magic, and will not use items such as wands, rods, staves, etc. Magical treasures are locked in vaults as curios or are destroyed.

6. This *telepathy* has a range of 100 miles and allows complete communication with all subject aboleth in that range. Note that all other types of aboleth can and do communicate by telepathic means, though this has a range of no more than 20 miles and must be used consciously. They can also communicate with other intelligent creatures by these means, with a range of 100 yards, but seldom do so.

7. The aboleth does not have an effective

biting attack because of the position of its mouth. If, for some reason, its opponent is immobilized, the aboleth may elect to consume its victim. If it chooses to do so, it receives but one biting attack per round. Damage varies with the type of aboleth; common ones do 3-18 hp damage per bite and swallow whole on a roll of 20, greater and noble aboleth do 4-24 hp damage and swallow whole on a roll of 19 or 20, and ruler aboleth do 5-30 hp damage and swallow whole on a roll of 18, 19 or 20. The grand aboleth never attacks in this way. Those swallowed take one quarter of their maximum normal hit points in damage each round until they die.

8. Most aboleth mate about once every 500 years. Each participant has one egg which it deposits in a safe place about a week after fertilization. This egg is surrounded by a thick cocoon of slime that protects and nourishes the egg. The egg begins about the size of a human head,

but over the course of five years it grows to be about 6' long. At this point, the aboleth hatches and begins a quick, one-year mutation into a miniature version of its parent. It takes about 10 more years before the aboleth reaches its adult stage, and during this time it is carefully guarded by other aboleth or, occasionally, by slaves. Ruler aboleth mate only once in their lives, and the growth process takes a total of about one hundred years, though it is the same in its various stages. Some noble aboleth have performed occasional cloning experiments, but one has yet to meet with any great success.

9. Because of their nonmagical nature, all aboleth gain a bonus to save versus spells equal to their hit dice divided by four, rounded up. This applies to all aboleth, including common ones (which get a bonus of +2). Also note that rulers and the grand aboleth are immune to some illusions due to their high intelligence.

GREATER ABOLETH

FREQUENCY: *Extremely rare*

NO. APPEARING: 1-3 (7-12 in city)

ARMOR CLASS: 3

MOVE: 3"/21"

HIT DICE: 12-14

% IN LAIR: 90%

TREASURE TYPE: A (x2) (with /R, S, T, U in city)

NO. OF ATTACKS: 4 tentacles

DAMAGE/ATTACK: 4-10 (x4)

SPECIAL ATTACKS: *See below*

SPECIAL DEFENSES: *See below*

MAGIC RESISTANCE: *Standard*

INTELLIGENCE: *Exceptional*

ALIGNMENT: *Lawful evil*

SIZE: L

PSIONIC ABILITY: 280

Attack/Defense Modes: B, C, D, E/F, G, I, J
LEVEL/XP VALUE: 12 HD: VIII/4,400 + 16
per hit point; 13-14 HD: IX/6,100 + 18
per hit point

Greater aboleth are simply larger, more intelligent versions of the common aboleth. They are normally only encountered in an aboleth city, although they are occasionally found in some other underground locale pursuing some strange, dark purpose. Their purpose in the aboleth society is to control the slave population, which they do with unrelenting cruelty. They possess *enslavement* powers superior to those of common aboleth, having a range of 60' and usable a number of times per day equal to the aboleth's hit dice. The save vs. spells is at -4, and only a *limited wish*, *wish*, or *alter reality* spell can counter it (though *enslavement* ends if the aboleth is killed as well). If more than two miles ever separate slave and master, the slave is entitled to another saving throw (still at -4). A hit from the tentacle of a greater aboleth has the same effect as that of the common aboleth, though its size

and strength result in 4-10 rather than 1-6 hp damage per hit. Greater aboleth produce slime just as the common aboleth, but in a 2' radius. Greater aboleth possess the psionic disciplines of *body equilibrium*, *ESP*, *levitation*, and *dimension door*, all at a

level of mastery equal to their hit dice.

The illusion-casting power of a greater aboleth is its ability to cast *improved phantasmal force* once per round, with auditory and visual effects, at will.

NOBLE ABOLETH

FREQUENCY: *Extremely rare*
 NO. APPEARING: 1-2 (3-8 in city)
 ARMOR CLASS: 3
 MOVE: 3"/15"
 HIT DICE: 16-28
 % IN LAIR: 95%
 TREASURE TYPE: E, F, X (with R, S, T, V in city)
 NO. OF ATTACKS: 4 tentacles
 DAMAGE/ATTACK: 2-16 (x2)/2-5 (x2)
 SPECIAL ATTACKS: *See below*
 SPECIAL DEFENSES: *See below*
 MAGIC RESISTANCE: *Standard*
 INTELLIGENCE: *Genius*
 ALIGNMENT: *Lawful evil*
 SIZE: L
 PSIONIC ABILITY: 310
 Attack/Defense Modes: *All/all*
 LEVEL/X.P. VALUE: 16 HD: 1X/8,100 + 20/hp; 17-18 HD: X/10,100 + 25 per hit point

The noble aboleth is an extremely powerful version of the common aboleth which has mutated in several ways so as to accomplish its duties. It is almost never encountered outside an aboleth city, where its role is that of the scientist. It does research, conducts experiments, and travels to alternate worlds to gather infor-

mation. There are two major differences in appearance between the noble and common aboleth. First, the noble aboleth's head is slightly larger than that of a common or greater aboleth. This makes its movement through water a bit more difficult. Second, two of the noble's tentacles are smaller and end in three fingers, which allow it to do very complicated and delicate work. These tentacles can still be used in combat, but they also can be used to manipulate items or devices (though they never use melee weapons). A hit from any of these tentacles has the same effect as a hit from a common aboleth. Nobles have *enslavement* abilities equal to those of common aboleth and secrete slime in a 3' radius. They possess the ability to cast *spectral force* spells at will, once per round. Noble aboleth have very powerful psionic abilities and can use the disciplines of *body equilibrium*, *cell adjustment*, *ESP*, *body control*, and *probability travel*. All of these disciplines are performed at a level of mastery equal to the aboleth's hit dice.

The exact nature of the various technological weaponry and devices created by noble aboleth is left to the DM to design. Helpful guidelines may be found in DRAGON® issue #114 ("Hi-tech Hijinks," page 84). Most such devices should parallel or duplicate magical devices in effect.

RULER ABOLETH

FREQUENCY: *Extremely rare*
 NO. APPEARING: 1
 ARMOR CLASS: 1
 MOVE: 3"/21"
 HIT DICE: 20-22
 % IN LAIR: 100%
 TREASURE TYPE: H, R, S, T, V
 NO. OF ATTACKS: 4
 DAMAGE/ATTACK: 5-20 (x 4)
 SPECIAL ATTACKS: *See below*

 INTELLIGENCE: *Supra-genius*
 ALIGNMENT: *Lawful evil*
 SIZE: L
 PSIONIC ABILITY: 340
 Attack/Defense Modes: *All/all*
 LEVEL/X.P. VALUE: 20 HD: X/15,700 + 30 per hit point; 21-22 HD: X/19,200 + 35 per hit point

These huge, bloated monstrosities are the largest and most intelligent of all aboleth (aside from the grand aboleth). Each rules an aboleth city and is never encountered anywhere else, except when it must mate (and must therefore travel to another city using psionic means). Its telepathic link with its subjects allows it to be constantly aware of everything going on in its realm. Rulers are, in most other respects, similar to common and greater aboleth. They possess *enslavement* abilities equal to those of greater aboleth and can generate *veil* spells at will. Rulers can generate slime in a 5' radius, and the mere sight of one causes *fear* in all beings of less than 5th level or five hit dice. They have extremely potent psionics and may use the disciplines of *body equilibrium*, *cell adjustment*, *clairvoyance*, *ESP*, *astral projection*, *body control*, and *dimension door* at a level of mastery equal to their hit dice.

GRAND ABOLETH

FREQUENCY: *Unique*
 NO. APPEARING: 1
 ARMOR CLASS: 0
 MOVE: 3"/24"

 INTELLIGENCE: *Godlike*
 ALIGNMENT: *Lawful evil*
 SIZE: L
 PSIONIC ABILITY: 370
 Attack/Defense Modes: *All/all*
 LEVEL/XP VALUE: X/32,000

The grand aboleth is quite simply the largest aboleth in existence on a particular world. It is not only incredibly huge (about

RULER ABOLETH

70' long with ten 30'-long tentacles), but also vastly intelligent. It has a telepathic link with every ruler aboleth on its world (within a range of 10,000 miles), effectively giving it complete knowledge of all that goes on within its empire. It can attack physically with great effect and exudes slime in a 20' radius. Its psionic powers are unmatched by any other aboleth, and it has the disciplines of *body equilibrium*, *cell adjustment*, *detection of good or evil*, *detection of magic*, *ESP*, *levitation*, *mind over body*, *astral projection*, *body control*, *energy control*, and *probability travel*, all performed at the 25th level of mastery. The grand aboleth also has *enslavement* powers equal to those of a greater aboleth and can create very effective illusions (save at -4). This monster dwells in a vast chamber in the midst of the largest aboleth city, which floats on the lowest portion of the worlds underground seas.

The illusion powers of the grand aboleth are equivalent to the spell capability of an 18th-level illusionist. The choice of the monster's spells are left to the DM to decide. The grand aboleth may also generate *veil* spells at will, one per round.

Final note

This article is intended to make the aboleth not only more complete, but more powerful. It is important to bear in mind at all times that the aboleth are extremely intelligent and have managed to maintain their control of the lowest depths of the Underdark for many thousands of years. No party of bold adventurers should ever be able to topple this mighty empire with ease. The grand aboleth is included only as the icing on the cake; actually meeting it would be nearly impossible, and it would require heroic effort to overcome.

The Ecology of the Actaeon

Don't cross antlers with one in his forest

by Aidan Doyle

Artwork by David O. Miller

There were six of them. Too many for me to handle alone. I paused as they drew nearer. They were heavily armed. I slipped back into the foliage. There was no doubt about it: they were heading toward the Tree of Saldis. I considered my options. I could summon the help of some more of my woodland friends, but the battle would be costly, and if possible should be avoided. I had sent Grubble, a bear, to greet the party, hoping that the priest among them would try to communicate with it. However, the black-robed mage in the group had merely laughed and disintegrated Grubble.

I could not allow them to reach the tree. The Tree of Saldis had been planted over five hundred years ago, when the great elven ruler Saldis dedicated it to the woodland folk of Achelos Woods. Since then several adventuring parties had tried to hack down the tree, for its wood was valuable. Its wood was ideally suited for the manufacture of potent magical staves. Then I recalled some of my mentor's tales, tales about a hero who had saved Saldis from an ambush and then led Saldis to plant the tree. This hero of the woodland folk was a creature named Seridus—an actaeon.

I knew actaeons were solitary creatures (except for their animal companions), but Seridus had not been heard of in many years. I had heard that actaeons live for 800 years, as long-lived as the elves. Hop-

ing that Seridus was still alive, I set out for the old growth where Seridus was rumored to live, a section of the forest I do not tend.

I approached the ancient grove slowly. I could sense an aura of peace and tranquility as I entered the grove and gazed at my surroundings. In the shade of a particularly tall tree was a patch of mushrooms and fungi. I later discovered that Seridus was a vegetarian and this the food he cultivated for himself. He told me that his metabolism was slow compared to humans and that he needed little food to sustain himself.

Continuing my scouting, I saw that a crystal clear stream ran through the grove, springing from a cluster of stones and forming a small waterfall over a rocky shelf. I felt a mystic presence issuing from the waterfall, not unlike the presence I felt while meditating. Obviously, this was the place of Seridus' power and served as a temple to the power that had appointed him. Indeed, we were both appointed as caretakers of the forest, by the same power.¹

I speak of Seridus as though he were male, for this is how he refers to himself. In fact, actaeons are asexual and cannot reproduce; they are the result of a transformation rather than a birth. A druid leads an elk to a place of tranquility and natural beauty, where the animal is

bathed in the power and radiance of nature and becomes a fully grown, intelligent actaeon. When an actaeon dies (either violently or of old age) another elk is summoned to replace him.

"Seridus," I called, hesitantly.

I heard a rustling sound and turned. A fearsome, towering creature had stepped out from the woods, at least nine feet tall. It was roughly humanoid but was covered in a thick, brown fur. What startled me most were the great antlers set atop the creature's head. I took an involuntary step backward.

I paused and saw that although the creature clutched a long bone spear in its hand, its face was reassuring. The gleam of wisdom twinkled behind the dark eyes.

The creature opened its mouth and spoke in a deep, measured voice. "Welcome, Dathrin Silverthrush."²

I managed a bow. "Greetings, Seridus. You know of me, then?"

Seridus moved gracefully into the grove and with a thrust planted the spear in the ground. "I know everyone and everything within this forest. The animals speak highly of Dathrin, their druid."

I colored slightly at the compliment. "Thank you, Seridus. I guess you know why I have come here, then."

"You seek help to stop the band of marauders."

I nodded. "Unless something is done,

they will reach the Tree of Saldis. There are too many of them for me to tight alone. From the way they bear themselves and the equipment they carry, they are experienced adventurers. If I called on the help of my woodland friends, many of them would die driving away this scourge. The marauders have already killed Grubble."

Seridus paused for a moment, then seized his spear, wrenching it out of the ground. He thrust it into the sky and let out a booming roar. "Let all know that Seridus, actaeon of Achelos Woods, acts to defend his forest. Let those who seek to harm the forest flee, or face my wrath."

I watched as the burly warrior and the priest made their way down to the stream. The warrior stood guard as the priest knelt and filled waterskins.

Seridus emerged from the bushes and stood, spear poised. Behind him, a grizzly bear named Burgin shuffled slowly forward. I had only recently met Burgin, but he was Grubble's cousin and wanted to avenge Grubble's death. Seridus pointed the spear at the adventurers. "Who are you to attempt to violate Achelos Woods?" he demanded."

The warrior stood momentarily surprised, then brought his sword to guard position. The priest dropped the waterskins and stood up.

Seridus glared at them. "Answer me, or

face my wrath."

The priest sneered and began an incantation. The warrior bellowed a battle cry. He moved forward, ready to slash at Seridus. Seridus moved just as swiftly, hurling the spear. It struck the warrior in the shoulder and sent him crashing backward, his armor rent and a gaping wound in his shoulder.

The priest finished his spell and six wolves appeared before him. Laughing, he pointed at Seridus. "Tear it to pieces."

The wolves bounded forward, but stopped when they neared Seridus. They paused, then sat on their haunches and whined. I later learned from Seridus that an actaeon's position of respect and power is so great in the woods that no normal forest animal will attack or harm him in any way. So long as an actaeon's allies are in his presence, forest animals will spare them as well. Magically summoned, controlled, or charmed animals compelled to attack an actaeon are confused and unsure what to do. However, an actaeon does not have the power to turn animals against their controller, and the animals will still obey other commands from their controller.

The priest hissed with anger. "Kill it," he commanded. Beside him, the warrior grunted with pain as he ripped the spear from his shoulder.

Seridus reached down to pet one of the

wolves. He reached into a quiver slung over his back and pulled out two spears, hefting one of them in each hand.

The priest began casting another spell, and the warrior staggered to his feet. I murmured a phrase and silence descended on the area, drowning out the priest's spell. The priest hefted his mace, and he and the warrior moved forward to attack Seridus. The actaeon hurled both spears. The first struck the warrior on the side of the head, knocking him to the ground, dazed. The next struck the priest in the chest, rupturing his armor and knocking him to the ground.

Seridus produced two more spears from his quiver and moved forward purposefully, just as the fighter staggered to his feet and swung his sword, striking Seridus in the chest. Seridus roared in pain and stabbed at the warrior with his spear. The priest had scrambled to his feet, but before he could take action, Burgin was upon him, grasping him in a bear hug.

The warrior was faring poorly against Seridus, and a blow from a spear left him clutching a deep wound in his chest. Seridus moved closer and jabbed with his spear. The warrior raised his sword and tried to fend off the blow, but Seridus butted him with his antlers, momentarily stunning the warrior. He then slew the warrior with a thrust of his spear.

The priest had battered Burgin with his

PORTINIUM® II

ENCHANTED HORIZONS ANNOUNCES: A new, low cost version of the original PORTINIUM Play-By Mail game is now available. **PORTINIUM II** incorporates all the features of the original game version. Players receive five standard game units on each of the primitive and medieval levels of game play. Time-travel into the conventional and futuristic technology ages affords players the opportunity to capture additional pieces to equal or surpass levels of conquest in PORTINIUM. The struggle to become a dominant player and participate in "The Gathering of the Four" remains a challenge for the strategy-minded player. Receive over twenty double-sided pages of high-quality Laser Graphics output per turn. Over 24,000 sectors to explore. No hidden costs. \$10.00 per turn. 3-week turnaround.

ALSO AVAILABLE: PORTINIUM, the original time-travel P.B.M. fantasy at a new, reduced price. The PORTINIUM Hi-Tech and Lo-Tech games offer many of the larger game features, in one age of play.

PORTINIUM
\$15.00 per turn
(4-week turnaround)

PORTINIUM HI or LO-TECH
\$5.00 per turn
(4-week turnaround)

One-time, LIFETIME setup fee of \$25.00 includes: 198-page Hi-Gloss Player's Guide, startup packet, free start-up turn, plus free turn and subscription to game newsletter.

ENCHANTED HORIZONS®

P.O. Box 9897 Spokane, WA 99209-9897 (509) 325-6941

mace and managed to free himself from the bear's deadly embrace. He staggered from the clearing, intent on escape. However, Seridus was quicker. Like a wolf bringing down a deer, he caught up to the priest and drove his spear deep into his back. The priest staggered and collapsed on the ground. Seridus paused, then raised the spear above his victim and drove it deep into the priest's exposed throat. I turned away, sickened by the blood. At the priest's death, the wolves faded away.

I was glad that I was not the one facing Seridus, for I have learned that actaeons are ruthless opponents. The concept of mercy is foreign to them—they fight until the threat to their forest is vanquished. If an opponent surrenders, an actaeon will quickly weigh the situation. If the actaeon has any doubts about the creature's sincere desire to leave the forest or to repair the damage he has caused, then the actaeon will slay the creature.

Moving swiftly, Seridus slung the body of the warrior over his shoulders. Burgin, who was badly wounded, shuffled forward and dragged away the dead priest. Even wounded and burdened with the weight of the warrior, Seridus still moved gracefully through the woods and left little evidence of his movements behind him."

I remained in hiding and watched from shelter as the other four adventurers arrived. The two thieves in the party knelt and examined the bloodstains on the forest floor. The silver-bearded fighter surveyed the woods, uneasily. The mage glanced at the blood, and then, noticing the unnatural silence of the area, moved away. He cast a spell, dispelling the silence.

One of the thieves, a thin, wiry man stood up. "Something dragged one of them into the woods. I don't know what happened to the other. Judging by the amount of blood, I'd say they wouldn't be worth bothering about."

The mage nodded. "Can you tell what did this?"

The thief shrugged his shoulders. "Judging by the tracks, I'd say it was a bear."

Seridus sprang out of the woods, spears grasped in his hands. "Who are you to attempt to violate Achelos Woods?" he again demanded.

The adventurers reacted swiftly, the mage beginning a spell, the fighter and one of the thieves surging forward with blades ready. The other thief balanced a throwing knife in his hand and aimed at Seridus.

Seridus roared, pouring a cloud of green mist from his mouth. The mist enveloped the adventurers, and I could hear startled cries of surprise from within the cloud. In a few moments the mist cleared, and four squirrels stood on the forest floor instead of the adventurers. Seridus had told me that he could breathe

this magical mist only once a day, and so saved it for use against larger groups, breathing on individuals if they were extremely powerful.

The squirrels were sniffing the ground in bewilderment, wondering how they had come to this place.⁵ Seridus moved forward and stared intently at the squirrels. He picked up one and placed it on his shoulder. He turned to the remaining three. "Begone from this place, my little friends." Obediently, the squirrels departed.

I emerged from the woods and moved toward Seridus. "Why did you take that squirrel?" I pointed to the squirrel on Seridus' shoulder.

"For this one, the transformation is only temporary. In a day, he will revert to his normal form. I do not want him to remain in the forest. I will take him from the woods and leave him in a distant place."⁶

"And the others?" I asked. "Are their transformations permanent?"

Seridus nodded, then fixed his gaze on me. "Thank you for your help, Dathrin. We will meet again in the future, I am sure." With that, Seridus turned and vanished into the forest.

Footnotes

The game statistics and description of the actaeon are found in the DUNGEONS & DRAGONS® *Rules Cyclopedia* on page 156. They are also found in the older D&D Masters Set *Master DM's Book* on page 24.

1. Depending upon a DM's campaign, this can be a specific Immortal, a mother goddess (for example, Demeter from Greek mythology), an elven Immortal, or even the "spirit of the forest."

2. Actaeons can speak Common, Elf and Dryad fluently. In addition, they have the permanent ability to *speak with animal* (as the second level cleric spell). This applies to all normal forest creatures.

3. Depending on the nature of their opponents, actaeons often use their surprise to question their opponents' motives and to demand that they leave the woods.

4. If the optional general skills are used, then a character with the tracking skill has his proficiency halved (rounding down) when searching for an actaeon's tracks. For example, a character with a 14 intelligence must roll 7 or under to spot the tracks. If found, the tracks will probably cause confusion, because they resemble the tracks of an elk with two hooves instead of four.

5. The *polymorph* effect of the breath weapon is identical (except for duration if the saving throw is passed) to the fourth-level mage spell, *polymorph other*. The *polymorphed* creature loses its memory of its former life and acts and thinks like the creature it resembles.

6. An actaeon can sense which transformations are permanent.

A guide to actaeons

At the most basic level, actaeons can be used as exotic druids. They can be used to curb the destruction of a forest by rampaging PCs.

Actaeons have a lot of role-playing potential if used in other ways. They can contact the PCs for help. An actaeon may face a particularly fierce foe and may need some assistance, or an actaeon may require something that is not normally found in a forest.

Actaeons can be used as long-term NPCs, especially in woodland campaigns. If any characters establish themselves as lords of a forest dominion, then an actaeon can be one of the NPCs who inhabits the land. The character could have an interesting time dealing with disputes between the characters' peasant families (some of whom are professional hunters and trappers) and an actaeon who forbids this loss of animal life.

Historical background

This information is included for readers who are interested in the origin of the creature, the actaeon. A human named Actaeon appears in Greek mythology. When out hunting, he was unfortunate enough to stumble upon Artemis, the goddess of the hunt, while she was bathing. For this, she turned him into a stag and his own hounds killed him.

A creature similar to the actaeon can be found in Celtic mythology. Herne the Hunter, a protector of woodland creatures, is an actaeon or woodland god. The BBC television series, "Robin of Sherwood," featured Herne the Hunter and is a guide to how an actaeon can be played. In the show, Herne takes a background role and lets Robin Hood be his agent in protecting Sherwood Forest.

Adventurer

As shaman of my tribe, I have many duties: recording births and deaths, healing the sick and injured, interpreting omens, making spooky jewelry from teeth, restoring the visage of our fearsome god when the paint starts to peel, and supervising potato-sack races. Upon this already massive mound of obligations, our beloved chief-tain has piled yet another task: writing ecology reports for illiterate kobolds. Oh joy and bliss. Who needs to sleep? Not me, apparently.

If you, like every other kobold, cannot distinguish a word from a beetle squashed on the page, please come by my office. I own a rare pair of *spectacles of literacy*. You can't borrow them, but you can admire the padlocked silver and elec-trum chest I keep them in.

HISTORY OF THE CRYPT OF CYSTUS

Our tribe has inhabited the Crypt of Cystus since time immemorial. Similarly, adventurers have been raiding this

dungeon since time immemorial minus two days. Luckily, until recently, the raids were restricted to one per year.

When Cystus built this vast, magnificent dungeon, he had the foresight to enchant the front door so that it could only be opened on the ninth day of the eighth month, the anniversary of his divorce from Rita the Rogue, and then only if one knocked three times and shouted, while drunk, "It's me, Rita... the harpy!" This fabulous safeguard kept the number of adventuring parties assaulting this place down to a minimum. Not too shabby, and far fewer than the sixty-something raids the poorly located Tomb of Horrors endures every year. (Cystus, unlike Acererak, felt no need to build his dungeon within walking distance of a bakery.)

By all accounts, until three months ago our tribe was thriving in this massive crypt. I'm not saying there wasn't room for improvement, mind you. There were many routine dangers here, such as wandering monsters and Ponzi schemes. Plus, at least three kobolds bled to death every

day in my waiting room while I took my afternoon nap. And, of course, the annual adventuring party raid. Still, our tribe was thriving and doing pretty well. Much better than now, that's for certain.

As I'm sure you know, Cystus's safeguard was overcome three months ago when an adventurer propped the front door open with a chair. Since then, adventurers of all types have been pouring in: sorcerers, paladins, arcane archers, bards—you name it. They come at the rate of one adventuring party per day, and all of them repeat the same rumor: that Cystus finally succumbed to chronic osteoporosis. Maybe it's true; I don't know. The last time anybody on our level saw Cystus was five years ago, when he came up here looking for his cat. What I do know, however, is that our warriors are being killed by the truckload (to use a popular anachronism I don't understand). Were it not for the hassle of packing and moving what must be dozens of boxes of stuff, I would suggest to the chief that our tribe relocate to a lower, deadlier level where, ironically, we'd be safer.

CHAIR OF PROPPING

When placed against a door, this magical chair prevents the door from opening if the door is closed, or closing if the door is open. The chair can only be removed by the person who placed the chair against the door, or by an interior decorator.

Moderate evocation; CL 10th;
Craft Wondrous Item, wall of force;
Price 100,000 gp; Weight 3 lb.

So here we are and here we remain, defending our home against adventurers on a daily basis and worrying about the survival of our tribe. Wait, did I say "worrying?" Why should anyone worry? After all, is it even possible for adventurers to destroy a kobold tribe that has survived a millennium in this haunted crypt through determination, courage, and rapid breeding alone? Sorry, I don't have time to answer that question. I'm too busy stamping the chieftain's seal on piles of death certificates.

PSYCHOLOGY OF THE ADVENTURER

Killing kobolds has always been an obsession for adventurers, or at least a really bad habit. Some days it seems

a kobold can't place a piece of quartz on a stool without an adventurer slaughtering him, stealing the quartz, and setting fire to the stool. Nonetheless, the true reason that adventurers begin adventuring is not and never has been about kobolds. Adventurers go into dungeons for another reason entirely—and the reason isn't treasure, if that's what you're thinking.

Several years ago, I sneezed while pronouncing the crucial final syllable of a *summon monster* I spell and somehow accidentally teleported myself into a tavern full of adventurers. Several of them promptly beat me into helplessness and dragged me upstairs to a room filled with obviously worthless copper pieces, castoff everyday weapons, and minor magic items. Their leader stared me dead in the eyes and said, "Explain your appearance in this tavern!" I replied, "Pretty much the way I look now, only with less bruises." One of them yanked off the tip of my tail and fed it to me. Swallowing quickly, I boldly asked their leader, "Why do adventurers go into dungeons?" The room became silent. Their leader spent several minutes cogitating,

then smiled and replied, "For fun." So that is the answer, straight from the source. Adventurers go into dungeons for fun. To them, adventuring is a game, it is something they play.

I have divided adventurers into three distinct types, based on their approach to fun. I call these groupings Gamist, Narrativist, and Simulationist. Every adventurer fits

cleanly into one of these three categories, without overlap.

GAMIST

Gamist adventurers are the most deadly type of adventurer, as their every thought centers upon destruction and competition. If a gamist fails to kill more creatures in a battle than his companions, he will rip off his own head in humiliation and hurl it against a wall.

Gamists are masters of the sword and bow, but are no less formidable when wielding improvised weapons, such as

chains, table legs, or bags full of kittens. Unlike other adventurer types, gamists never speak.

NARRATIVIST

Narrativist adventurers are the thinkers in the party and love agonizing over what is right and wrong. Not surprisingly, narrativists are also the easiest to kill. The backpack of a typical narrativist contains a map, a journal, a memento from his dead parents, two or three worn books, a corsage from his junior prom, some letters from the family who raised him, a 30-pound tome of his true family's history, the last twenty-two issues of his favorite magazine, a pair of bronzed baby booties, a library card, receipts, and a miniature globe. Everything that happens to the party is recorded by the narrativist in his journal. The quickest

ADVANCED ADVENTURER

Adventurers distinguish their skill and rank among one another by their number of possessions and the speed at which they kill things. Those with the most treasure, most powerful magics, and largest body counts are called heroes, while those with the least are called cohorts.

way to kill a narrator in battle is to distract him with a question about his background. He will usually stop attacking to explain his coat-of-arms or why he is wearing a carnation in his buttonhole.

SIMULATIONIST

Simulationist adventurers are prepared for anything and never carry less than 200 pounds of gear (not counting armor and weapons). A typical simulationist carries a 10-foot aluminum pole, a comb, a mirror, wolfsbane, garlic, a pound of salt, 400 feet of knotted rope, a bedroll, flannel pajamas, a 15-foot pole, a 7 1/2-foot pole, a favorite pillow, two carrier pigeons, breath mints, a padlock, a first aid kit, a second aid kit, a laminated card naming several people to contact in the event of an emergency, a dog

whistle, a canister of lamp oil, a pornographic drawing of an elf maiden, and so forth. Simulationists, being more curious than gamists or narrativists, can sometimes be lured into traps, ambushes, and small obvious cages. For reasons unknown, all simulationists have difficulty speaking in a normal fashion. Instead of saying "I see a chest," for example, they might say, "Verily, a chest!" or "Arrr, there be a chest, says I."

PHYSIOLOGY OF THE ADVENTURER

Although it pains me to admit it, we kobolds have more in common with adventurers than we do with our crypt-mates. Have you noticed that ropers, darkmantles, and oozes don't even have laundry? Adventurers, on the other hand, have two eyes, a nose, and lack tentacles—just like all of us (not

counting Jimp, of course; sorry about that potion, Jimp). I'm not saying that adventurers are in any way preferable to our crypt-mates, not at all. But at least I can imagine how to go about torturing one.

In many important ways, however, we are extremely different. Consider the adventurer's diet. One might assume each adventurer consumes 900 pounds of raw flesh every day based upon the number of creatures they kill, but this is not the case. Adventurers only eat desiccated rations, which they bring with them. I know this sounds implausible, but trust me, an adventurer has never set foot in a dungeon in search of moist delicious food. My mother has had her kitchen ransacked by adventurers no fewer than eleven times and not once did they even force her to make sandwiches.

Attack Options Cleave, Combat Expertise, favored enemy +2

Unnamed XXIII, hawk familiar²: 8 hp; *Monster Manual* 273

¹ Why? ² Ughh... you figure it out. ³ Hidden among equipment with the corpses of familiars one through twenty-two.

Because of the numerous dead creatures left in the wake of adventuring parties, scavenging vermin have experienced massive population surges in the crypt. This is becoming a problem, so if you see any vermin breeding, stomp your foot and scare them apart. Currently, I estimate no fewer than two hundred gnomes roaming our corridors.

WEAPONS OF THE ADVENTURER

When not plundering dungeons, adventurers live in taverns on the surface, where they spend their time creating new, deadlier weapons to use in plundering dungeons. Over the years, the swords and arrows of adventurers have become so powerful that kobold warriors have started wearing armor

to impress women rather than for any measurable protection. Concerned, our master armorer hammered together a special oaken shield thick enough to deflect at least one blow from their latest super-weapons. Unfortunately, at 23 inches thick, it proved too heavy to lift.

At the rate things are going—the imagination of adventurers being outweighed only by their bloodlust—eventually an adventurer will arrive in our dungeon with a weapon so lethal that it kills any kobold approaching within 30 feet of it. At that moment, we will know the days of our tribe are truly numbered and without hope. Oh wait, never mind. An adventurer brandishing a dagger like that came through last week.

TACTICS OF THE ADVENTURER

Adventurers are resourceful. They flank, sneak attack, levitate their archers above the reach of our swords, throw glass flasks that release eight-headed hydras, cast sonically-substituted fireballs, open massive gates into the Lower Planes behind legions of kobolds then scare them into flight with *symbols of fear*, and so on. Their most infuriating tactic, however, is not destructive: it is their application of resurrection magic on their dead. Seriously, that spell infuriates me. I've seen it happen over and over. Wave after wave of kobold warriors stream at an adventuring party until finally we kill one of them, and then tomorrow I see that same adventurer perched on the

statue of the king, prying the rubies out of its eye sockets.

The chief once asked me what kobold warriors can do to counter the tactics of adventurers. All I could come up with was, "Kill themselves to deprive the adventurers of the pleasure." Lucky for me his royal pompousness thought I was joking.

SOME POSITIVE STUFF

Adventurers are a curse upon dungeon dwellers and we must recommit ourselves daily to their swift and merciless destruction before they succeed in eradicating us completely. But let's not go overboard. Adventurers are responsible for several good things, too.

For starters, they cull from the tribe our weak, our sick, and our not-exactly-sick-but-taking-vitamin-B-just-in-case. As a shaman dedicated to keeping the tribe healthy, this certainly lightens my workload.

Furthermore, because so many warriors have died in countless battles over the past few months, the lady kobolds now outnumber the males eleven to one. As tragic as this is from a military perspective, one can't help but notice that even the shortest, ugliest kobold warrior now enjoys at least five adoring wives... and most have far more! Myself, I have attracted thirty-one. I would be the happiest kobold in the tribe were it not for that spiked pit accident a few years back.

One would also be crazy to overlook the benefit of magic items. Adventurers bring these wonders into our shadowy world, not the other way around. The same goes for gold. We all hate adventurers, but whose coins do we use when we want to purchase sausages from the illithids? Not kuo-toa clamshells, that's for sure.

Lastly, I must mention our generous pension plan. I feel morbid saying it, but it remains well-funded only because so few kobolds live long enough to collect.

If you are wondering why I've mentioned benefits derived from our enemy, I don't know. I might have a fever. Or maybe I'm looking for the silver lining in a dark, imposing cloud that hates us

NEW KOBOLD FEATS

Kobolds might choose a variety of unique feats to aid them in surviving. Unfortunately, they're about as good at choosing feats as they are at surviving. A kobold must have seen adventurers within the past five weeks to qualify for these restricted feats. Dreaming about seeing adventurers shouldn't count, but it does anyway.

Bad Decision

You made a bad decision.

Prerequisite: Kobold.

Benefit: Upon choosing this feat, the kobold experiences an odd, nagging feeling that he did something really stupid. Wasteful, even.

Dying Shriek

You refuse to die quietly.

Prerequisite: Kobold.

Benefit: Popular among kobold prison guards, this feat allows a slaughtered kobold to scream a short phrase upon his sudden, unexpected death. Popular screams are, "The humans have escaped!" and "I told you we should have killed them!"

Special: A kobold fighter can select Dying Shriek as a... nevermind. There are no kobold fighters.

Elf

Better to die as an elf than as a kobold.

Prerequisite: Kobold.

Benefit: Upon selecting this feat, the kobold spontaneously polymorphs into an elf and is immediately killed by nearby kobolds. This feat can only be selected by mistake.

Volunteer

You have a death wish... in addition to being a kobold.

Prerequisite: Kobold.

Benefit: A kobold with this feat boldly volunteers for any mission involving adventurers. Typical missions are, "Sneak into the adventurer's camp and strangle their guard dogs," and "Sneak into the adventurers' camp and smear their wizard with grease so he will be afraid to throw *fireballs* tomorrow." If a kobold survives five years with this feat, his chieftain attempts to memorize his name.

and wants to blast us with sonically-substituted, empowered *lightning bolts*.

FINAL THOUGHTS

Speaking as a fellow kobold, I'll be as direct as possible. The odds of you dying by adventurer are high. So high, in fact, that if you accidentally drank a quart of poison it would only reduce your chance of dying at the hands of an adventurer by five percent. Despair not, though, and more importantly, complain not, as the king says any dissent undermines the war effort and gives him a headache. So sharpen your gnome-sticker and never forget: We kobolds have battled adventurers since before the dawn of time! We are due for a win.

When you finally meet your foe, roar like a descending dragon and attack him with all the fury of our entire remaining population. If all goes well, you might qualify for a medal. If all doesn't go well, you'll likely find yourself dying on the cold stone floor, one of many kobolds whose broken bodies form a pathetic bleeding ring around a defiant scimitar-whirling cyclone of death. When that time comes, do not ponder the hopelessness of calling out for medical aid, but instead die in peace, comforted by the knowledge that I, Mokumok the Shaman, will record your death for posterity and the chief, as always, appreciates your sacrifice—probably. ☞

A case when two heads are definitely worse than one

*M y L a d y J e s s i c a ,
Enclosed you will find several sheets of
parchment, detailing the strange two-
headed snake occasionally found in these
parts. My patrol came across the parch-
ments in an old tin box hidden in a cave
up in the Crumbling Mountains. I know of
your passions for both history and biology,
and thought it might be of interest to you.*

*Very Respectfully,
Captain Gharn Armstrong*

To Whomever Should Find This,

My name is Sigard of Escillon, a sage of some small note. I am being held as a slave to a band of kobolds. I was captured several weeks ago, while I was wandering in search of the fabled two-headed snake, the mis-named amphisbaena.¹

I was wearing my magical ring of serpent control, as was my usual habit when doing field research, when I was taken by surprise by a band of kobolds. They overpowered me, a not too difficult task, for I fear my younger days are far behind me. For a while, I feared they would kill me, but I was fortunate. While I could make no sense of their strange language, I still remembered a smidgen of the goblin tongue, enough to communicate with my captors.

There was a heated argument among the larger of the kobolds, but in the end, I was allowed to live, after convincing the kobold "king" that I could write. It seems the band has no written language, and I am now the official scribe of the Band of the Twisted Horn. The "king," whose name sounds like the "Yipyip" of a small dog, and whom I call simply "King," is having me chronicle the adventures of his life for posterity. As none of them can read, I am instead devoting my time to this record of my captivity, and to the study of the amphisbaena, as I originally intended when I set off in these mountains.

In a way, my situation here is ironic indeed. I had hoped to find an amphisbaena, and use my ring to keep it from attacking me as I studied its behavior. Now, I am living with one of the creatures, much closer than I had ever expected. It seems only fitting that I should use the opportunity to document all I can about this marvelous being.

I should start by saying that this kobold band of mine makes their lair in a cave network deep in the side of a mountain. The kobolds seem to see just fine in the dark, but I am allowed to keep a light in one of the back caverns to allow me to

THE ECOLOGY OF THE AMPHISBAENA

by Johnathan M. Richards

Artwork by Scott Rosema

write of King's exploits. However, I am no pampered slave; I am forced to do my share and more of the menial work.

Last week, I and three kobolds were assigned the task of bringing water to the cave in rusty old buckets. As we neared the cave entrance, there was a flurry of movement, and the lead kobold was struck by something large. Though my eyes were still adjusting to the light from the entrance, I recognized the form as that of a giant snake. Furthermore, although only one head was visible at the time, it was recognizable as that of an amphisbaena, by the small horns above each eye.²

Instantly I froze, and called out for the others to do so. The snake had bitten the lead kobold,³ and it was clear that the poison was taking effect immediately. The poor creature dropped to the cave floor and started convulsing. Meanwhile, the two other kobolds and I began to back away slowly from the giant snake. Out of force of habit, I attempted to control the snake with my ring, but had forgotten that it had been taken from me when I was first captured. Once we were out of range of the amphisbaena, I sent the kobolds to fetch King.

I was left alone with the creature I had come to study. In the dim light, I watched as it approached its meal.⁴ The kobold had stopped twitching by then, and as the closest head opened its jaws to swallow its prey, the snake swung its body around so its other head could watch me. Even in the darkness of the cave, there was no doubt in my mind that the amphisbaena knew exactly where I was.⁵

The creature's jaws distended and surrounded the kobold, and slowly, the little humanoid was swallowed whole, head-first. The process took about two minutes, and afterward, I could still see the bulge in the amphisbaena's body where the kobold was being digested. By that time, I could hear the pounding of little footsteps behind me. The amphisbaena raised its head and flicked its tongue in the air, trying to gather information about the new threat.⁶

King and four of the bigger kobolds approached, armed with their spears, and

seemed ready to destroy the threat to their lair. It took some doing, but, in my broken goblin, I managed to convey the idea that the amphisbaena was worth more to the tribe alive than it was dead. I think it was the concept, once I explained the power of the ring, that King could bend the creature to his will that sold him on the idea.

It took some practice, but King was finally able to exert his will on the snake. We started with simple things, like making the snake move from one side of the chamber to the other. The amphisbaena did so by sidewinding, which seemed strange to me, until I took into account its unusual anatomy.⁷ Had it been up to him, I'm sure King would have played with his new "toy" all day, but I convinced him to let the creature digest, by warning him that the ring's power was limited, and would wear off with too much use at any one time.

My knowledge of snakes has served me well in my captivity. No longer am I a mere scribe of the Twisted Horn; now I am closer to a military advisor to King. The little kobold leader sees the amphisbaena as his master weapon, and has used it in numerous attacks against the band's enemies (chiefly goblins, it seems). I view my captivity as a chance to study the amphisbaena, and have perhaps learned more about the creature through my close proximity than any other before me. As for the battles between the kobolds and goblins, I care little whether they all kill each other, so long as my own safety and that of the serpent is assured.

I am constantly amazed by this creature. When last I left off this journal, the snake had finished eating its kobold meal, and was digesting. It digested the little kobold in little less than a week, breaking down all parts of its body except the small horns. During the entire time, the serpent barely moved. Indeed, a great deal of that time might have been spent in sleep, but as snakes have no eyelids, it is of course difficult to say.⁸

The first time King took the amphisbaena on a raid, we attacked a band of goblins that laired in a cave farther down the mountain. I accompanied the kobold war band, as always, but stayed near King, away from the front lines. King had his troops position themselves on a ledge above the goblin's cave entrance, with the amphisbaena behind the kobolds as a backup. We were stationed by the serpent, where we could see all of the mountain-side battlefield.

The goblins were summoned out of their hideout by a war-challenge from King; apparently these races have a long-standing hatred toward each other. Within moments, a small horde of goblins appeared, ready for battle. Instantly, King's band leapt upon them, and the small humanoids joined in violent battle.

There were losses on both sides, but the kobolds had the high ground, and seemed to be overtaking the goblin forces, even though the goblins had started with slightly greater numbers. Finally, King pointed to a goblin figure in the rear, apparently the tribal leader (it seems that these goblins were led from the rear, as were the kobolds—neither race seems particularly noted for their bravery). Summoning the power of the ring, he commanded the amphisbaena to attack.

This was the first time I saw the amphisbaena's unusual surprise attack—the serpent grasped one of its necks with its opposite mouth, forming a hoop of its body.⁹ Then, with a push of its body, it rolled down the side of the mountain, like some great serpentine wheel.

Amazingly, as the creature rolled down the side of the mountain, it seemed aware of its surroundings. Twice on its journey it managed to swing around obstacles—goblin and kobold combatants in each case. At the last moment, the goblin leader saw the snake speeding toward him, but by then it was too late, for the amphisbaena was upon him, uncoiling at the last instant in order to strike at its prey with its venomous fangs. The goblin chief was dead before he even knew what hit him.

The death of their leader had an adverse effect on the remaining goblins—those able to do so dropped their weapons and took off at top speed in all directions. King mobilized his troops and explored their new conquest, a cave network as filthy and foul-smelling as our own. There were squalls and yips of delight as they came upon the goblins' pitiful treasure, which primarily consisted of copper coins and hunks of rotting meat of unknown origin.

I have just learned of another strange ability of this strange two-headed snake. It is now close to winter, and our band has been preparing for the coming season. After some discussion, it was decided to remain in the old cave system instead of moving into the goblins', as our own was more easily defensible, and had easier

access to a water supply. However, the contents of the goblins' larder was transported to our own cave system, and while it smells half-rancid already, I prefer it to the bodies of the goblins themselves, which the kobolds are using as a source of meat. The snake surprised me by eating one of the dead goblins. Apparently, the amphisbaena is not averse to eating carrion.

But back to the new ability I have discovered. Our band was attacked by a lone ogre mage, seeking a dwelling for the winter. Apparently he thought he could simply walk in and take over the band, but King's dominance over the amphisbaena has given him rather a big head. Instead of complying to the ogre mage's demands, he had the Twisted Horn attack en masse.

I could tell that the ogre mage was surprised at this turn of events, but he quickly switched to battle mode and attacked his diminutive foes. He cast a darkness spell, which turned the dim area of the cave opening into pitch blackness, and I could make out the occasional squeal of pain as the kobolds met up with the ogre mage's blade in the darkness.

While this was occurring, King summoned forth the amphisbaena, and ordered it to attack. It went sidwinding down the cave tunnel, and sight of it apparently boosted the kobolds' morale, for they cried out a battle roar and rushed into the darkness behind the snake.

Presumably, the ogre mage saw this mass attack, and decided to cast one of its more powerful spells, hoping to take out a large chunk of its foes at once. From somewhere in the globe of darkness a cone of cold burst forth, freezing the little kobolds where they stood. There was almost immediately a cry of surprise and pain, then complete and total silence. When the darkness spell wore off, the results of the battle were plain to see. In the center of the cavern lay the ogre mage, dead, with a look of surprise on his face. Surrounding him were several dead kobolds, their frozen bodies covered in frost, as was a strip of cavern floor leading from the spell-caster's body. And there, on the ogre mage's chest, curled the amphisbaena, unhurt, even though one head and three feet of body also were covered in frost.

Apparently, somehow, the creature's scales make it immune to cold. How this can be I am at a loss to explain.¹⁰

Another surprise. It is now spring time; the cold mountain winter passed pretty quietly after the ogre mage attack. The amphisbaena spent most of the winter in a hibernation-like state. King worried that it was sick, since it didn't move or eat, but I assured him that its state was perfectly natural, and that snakes can often go for over a year between meals.

Once it warmed up, though, the snake revived, and was fed a goat the kobolds had caught among the rocks. I must say the kobolds treat the amphisbaena better than a pet; to them it is a cross between a war animal and a demigod. Several of them have taken to wearing crude representations of a two-headed snake on their shields, and there is talk of changing the name of the band to that of the Band of the Serpent. King seems unsure; on the one hand, his is the twisted horn after which the band is presently named, and he does have an ego big enough to want to remain in the spotlight, yet he realizes that the snake is becoming universally seen as a symbol of power, and his mastery over the snake makes him seem all the more powerful.

Soon after the spring temperatures started to remain constant, the amphisbaena gave birth. This was somewhat of a shock, as the snake has not been in contact with others of its species in over half a year, when we first encountered it.¹¹

King is concerned, and rightly so. It is unlikely he will be able to control all of them with the ring, and there are bound to be problems with so many venomous creatures living with us in our cave complex. On my advice he has decided to gather them together in a metal box and carry them close to the site of one of his enemies, where they will be released. I have assured them that the creatures cannot be raised as "pets," or commanded by another without use of a control device like my ring. King definitely wants to be the only one with such a powerful ally. He and his strongest kobold advisors are busy now making plans on which of their enemies is to receive the "surprise."

It is many months later now. King has gotten even more power hungry than before. I overheard him talking to one of his kobold advisors about my limited usefulness. He has long ago given up on his dreams of having me chronicle his life, as my continued attempts to teach him, or any of his band, to read have all met with failure. Thus, a written history of his life will be useless once I am no longer around to read it to them. King also realizes that the life span of a kobold is greater than that of a human, and that while he is in his prime, I am an old man, with few years left. While I was able to provide him with knowledge about the care of the amphis-

baena, I was still a valuable asset to the band, but now I fear there is nothing left for me to tell King that he doesn't already know. He has become quite adept at commanding the amphisbaena, and has already expanded the tribe by absorbing several other kobold bands into his own. I plan to make a break for it as soon as the next opportunity presents itself. I will leave this record behind me, hidden in a small box in a crevice of my cave room. If I survive, I will not need the notes on the amphisbaena, for I have it all in my head, where it cannot be taken from me. If I am caught, I am sure I will be killed, and then at least there is a chance this record will survive me.

Sigard of Escillon

My Dear Captain,

My deepest thanks for the parchments detailing the amphisbaena. I have searched the library records, and have found several works on serpents by Sigard of Escillon, written well over one hundred years ago, but none of them on this particular subject. I am afraid we must conclude that Sigard did not escape from the kobold band.

In any case, I have made the parchments available to the scribes at the library, and they in turn send their heartfelt thanks for the information made available on the ecology of the amphisbaena.

*With Fond Affection,
Lady Jessica Heartcross*

Notes

The amphisbaena can be found in the MONSTROUS MANUAL™ book on page 320, under the "Snake" heading.

1. Actually, the true members of the family amphisbaenidae, while snakelike in appearance, are legless lizards. They are often called "worm lizards" because the rings of ridges around their bodies give them a segmented appearance, like a worm. Amphisbaenidae are non-poisonous, living on insects and worms, and pose no threat to man.

The two-headed snake known as the amphisbaena, on the other hand, appears to be a member of the Viperidae family of snakes, a pit viper.

2. The amphisbaena's horns are too small to be effective in combat. Instead, they are used when the snake molts. As the creature grows in size, it periodically sheds the outer layer of its skin. Normal snakes rub their snouts against a rough surface, until the old skin is ripped open, then proceed to work the skin backward over their head and along their body, leaving behind an inside-out husk. Amphisbaena go through the same process, but since they have a head at each end of their body, the dead skin bunches up in the middle of their body. This is where the horns come in: the creature uses them to cut the dead skin open, and free itself from its husk.

3. Actually, the amphisbaena doesn't bite

so much as stab. Like other vipers, the amphisbaena has two fangs on its upper jaw. These fangs can assume two positions: when the mouth is closed, the fangs fold back along the palate, but when the mouth is open, the fangs are extended forward until they point at the snake's prey. When the creature strikes out at its victim, it punctures its skin and injects it with a toxic venom (the victim must save vs. poison or die immediately). The amphisbaena will then wait until its victim dies of the venom before attempting to eat it.

4. Since the amphisbaena has two heads, it has an advantage over other snakes in being able to feed and keep guard for threats at the same time. Most other snakes will only feed when they are alone.

5. The amphisbaena is a form of pit viper; thus it has the characteristic "pits" in the sides of its heads (one between each eye and nostril). These pits are extremely sensitive to variations of heat, and can discern temperature changes as small as 0.2 degrees Celsius. By comparing the heat images received by the two pits, the amphisbaena can target the exact location of its prey, even in complete darkness.

6. Snakes are deaf, but can pick up vibrations from the ground. Their deafness makes them immune to most sound-based attacks, such as those made by the androsphinx and dragonne. While their eyesight tends to be weak (their eyes are

fixed in position, and cannot move, so they are unable to make out details very well), they have a keen sense of smell. Their tongues pick up particles of scent in the air, and transfer them to an organ in their mouths that in turn transmits information about the scents to the brain.

7. Most snakes are made up of three body parts: the head, body, and tail. The amphisbaena essentially has two heads and two bodies, which meet at a common vent, or cloaca (the reproductive and excretory opening), and no tail. While normal snakes can slither forward on their ventral (belly) scales, the amphisbaena cannot, as its scales are going in two different directions, meeting in the middle. The creature therefore uses a sidwinding technique as its primary form of movement; basically, it raises one head and throws it forward, then follows with the rest of its body, and continues the process.

Each half of the amphisbaena's body seems to have a complete set of internal organs: two sets of lungs, two hearts, two stomachs, and so on. While snakes usually go into a state of torpor after feeding, and are therefore vulnerable, the amphisbaena avoids such vulnerability by only feeding one stomach at a time. While the nourishment provided by the food affects both "halves" of the creature, only the "half" that ate is sluggish while it digests; the other head is alert and ready for danger.

8. Snakes do have transparent scales that cover their eyes, protecting them. When the snake molts, and the outer layer of skin begins to separate, the eye scales get milky in color, and the snake's already weak sense of vision becomes almost nonexistent. Unfortunately for the amphisbaena, the entire body molts at the same time, so it cannot use one head to stay alert at all times during molting as it does during digestion.

9. The amphisbaena is able to keep its fangs retracted during this procedure. The powerful jaws of the snake are strong enough to keep a firm grasp on its neck without danger of inflicting damage on itself with its fangs. In any case, the amphisbaena is immune to its own poison.

When the amphisbaena uses its rolling ability to attack its prey, the victim of the attack suffers a -2 modifier to his surprise roll. This penalty is negated if the victim is aware of the amphisbaena's strange ability.

10. The amphisbaena, while definitely an extraordinary specimen, is nonetheless a snake, and therefore cold-blooded. As such, it is unable to generate its own body heat, and is instead reliant on external heat sources to keep warm enough to function. Snakes often will bask in the sun or bury themselves in sand for this reason, and the amphisbaena is no exception.

Oddly enough, the scales of the amphisbaena have developed a magical resistance to all forms of cold-based attacks. While this prevents the snake from taking damage, the cold attack does prevent the snake from gathering heat. In the situation described, the amphisbaena took a direct hit from the *cone of cold*, yet took no damage. However, the attack did cause frost to cover part of the serpent's body, and until this frost melts, the snake will be unable to store heat naturally. This has no effect on the snake in combat, but will possibly affect it in the long run, forcing it to bask longer later on to restore heat.

Wizards often use amphisbaena scales as ingredients in the manufacture of spells and items providing protection from cold-based attacks.

11. Many female snakes can store sperm cells from previous matings. This is quite an advantage, as snakes mate infrequently; this allows the female to "time" its pregnancy during its winter hibernation. The snake is therefore not inconvenienced by its pregnant state, for it spends the whole time immobile any way, and the young are born in the spring time, when they have the most time to feed during the year in order to "stock up" for the winter season.

Some snakes lay eggs, and others give birth to live young. The amphisbaena gives birth to from seven to twelve living young. The newborn snakes immediately go their own ways, to live their own lives. There is no concept of "family" among amphisbaena, and young that hang around too long are liable to become food for the mother.

The Ecology of the Anhkheg

Hunting down the farmers' bane

"We're ruined, your wizardship!" shouted a farmer, his voice echoing from the smoke-stained rafters. "Our lands are infested, and it's not even safe to go near the fields, let alone grow crops on them!" The angry, frightened crowd echoed his sentiments as a roar of shouting broke out across the meeting hall. It was a sea of chaos.

I closed my eyes and prayed for internal peace. *Why me?* I thought. Baron van Kirwak IV owned these lands; *he* should be here, taking command and solving this problem. I was a mere sage tied to a petty nobleman in the baron's service — hardly the wizard everyone took me for. Now I regretted putting "experience with exotic animals" down on my resume. All I had actually done at the academy was change the papers in the cages of the alchemical laboratory animals.

My eyes opened and patience fled. "I will have order!" I shouted as I stood up at the

desk that had been set up for me at the front of the village hall. "Silence here! Let's have but one speaker at a time!"

I wished that I had a spell or two to cast, just to impress the crowd, but I had none, of course. Nonetheless, my voice seemed to do the job well enough.

"Alright, your wizardship!" screeched a withered, old man as he stepped forward. "There's something in our fields, and if we don't have a harvest to show the baron, he's going to kick us off our lands. Then where will we go?" The crowd murmured its concern over the question.

"I was sent here by the baron to find out what sort of beast has been plaguing you," I told him. "Then, perhaps, we can deal with the beast. Now, this thing —"

"It's a big thing! Looks like some sort of giant insect, it does," interrupted an old woman from the side of the room. "We saw it spring up out of the ground and fall upon one of our dogs, out for a run. Bit the poor thing in two!"

"Yes, but what did it look like? The

monster, I mean."

"It was brown on top and pink on its underbelly," said a farmer leaning on a crutch. "I saw it the night we tried to kill it. We looked for its tunnels, like a giant mole's, near the edge of one of the fields. There were about fifteen of us, and we weren't thinking about being too quiet, as everybody with sense knows bugs don't hear. Suddenly, the ground shook a little bit, and right ahead of us, the earth opened up! The monster had us! It looked bigger than a horse, easy, and it caught us off guard. The only thing I could think about was running, and I ain't ashamed to say it, either! I dove to the side, towards the woods, and I heard the thing make a horrible hissing sound. Then something wet hit my leg, and it felt like fire! I crawled away. I could see some of the others were still on their feet, and were throwing pitchforks and the like at it. Bounced off, every one of them. Then the monster killed two of our dogs and scared the rest of 'em across the country, and the

rest of us took off for home."

I looked at the man's leg wound. From what little I could see of the wound, I judged it to be a burn. A light dawned upon me. "This monster," I asked suddenly. "Did it look like a praying mantis?"

"Nope," said the farmer. "Looked like a horn-headed devil!"

"Did not!" cried another farmer. "It was like a praying mantis, only a hundred times bigger!"

"You were too far away to see it!" shouted the injured farmer. The hall was instantly filled with heated abuse.

In the turmoil, I picked up enough conversation to confirm what I had first suspected. I got to my feet and waved my arms. "Silence! SILENCE, IN THE BARONS NAME! I have the answer! I know what monster has been bothering you!"

You could have heard a needle drop. I lowered my arms. "What you have in your fields is a beast called an anhkheg." I remembered when such a monster had been captured and brought in for study at the academy. It was big, ugly, and powerful, but stupid; we had eyed it nervously as it slammed itself against the sides of its force-walled cage. My hands grew clammy at the memory.

"They look like and are related to the praying mantis," I continued, "but they are of monstrous size and dig tunnels through the soil. They use the substances found in the earth as their food. But, when one of them is greatly disturbed, it can vomit an acid from its stomach that can dissolve rock." I looked at the farmer with the bandaged leg. "You are already aware of this weapon, of course. Though they feed upon soil, anhkhegs would prefer to get live meat — your cattle, your dogs, or your children and yourselves."

That got a rise out of them. I continued when the cries of alarm died down. "You were wrong in thinking that the anhkheg could not sense your coming. Anhkhegs sense all vibrations in the earth around them. They can detect a footfall from a field away. The lot of you going to track it down would have been easy for it to detect.

"As for killing it — an anhkheg has a tough shell, and it takes enormous force to break through it. It's as thick as plate armor. If you can kill one, you could even make a strong shield from the chitin. You'd have to treat it in chemicals and preservatives, of course. The point is that an anhkheg was built to take what it wants, from whomever it wants.

"But," — I raised a finger as I spoke — "it does have a few weaknesses. All insects hate smoke, and anhkhegs are no exception. If you had a large cage trap; you could put it near one of the openings of the monster's tunnels. After blocking the other exits, you could start huge, smoky fires in several of the exits themselves. To avoid the smoke, the monster would move down the tunnel leading right into your trap. Once captured, you could put the

anhkheg to sleep by pouring a volatile liquid, such as turpentine, onto or near the beast." The anhkheg we had studied at the academy was captured in much the same way.

The farmers looked glum at that, however. "We don't have any turpentine, your wizardship," one called. "We could build the trap, but what would we do if it broke free? What if we missed a tunnel exit, and the monster came back for us?"

"We can't even wound the ankee-thing," another farmer shouted. "You said yourself that we couldn't break its skin!"

"And what if it spit at us again?" shouted the farmer with the wounded leg. "It could kill the lot of us!"

"I ain't a-gonna look for no ankee's tunnels!" shouted someone else. "Why doncha just burn the thing with your magic, your wizardship?"

It took half a minute to still the crowd again. "The baron believes that you can deal with this crisis on your own," I lied, not saying that the baron was too busy counting his loot from his recent adventuring, and cared little for concerns at home. "I was ordered to save my powers, and I must obey. But, there are other options which you might try." I was remembering more and more of that particular lecture in the academy, so long ago, when the anhkheg was brought in. "They depend upon what condition the beast is in. To take up these options, however, you must be willing to part with some of your cattle or goats, to feed the monster for a few days or weeks. This is —"

The immediate uproar revealed the town's opinion. "And what good would that do?" shouted the man with the wounded leg.

"It would keep the creature where it is, so that it doesn't roam the area! With the anhkheg satisfied for a short time, you can bring about its destruction — which you surely must, if the anhkheg is a *female*." The crowd began to fall quiet. "You see, there's but one anhkheg out there, now. Would you care to deal with a dozen?"

Silence fell like a rock. "You mean it might breed?" asked the brawny youth, his face pale.

"If you have a female, indeed it might," I told him. "In the late fall of each year, each anhkheg seeks out a partner and mates. Soon after, the female kills the male and starts preparing a nest, usually a widened dead-end of a tunnel. But the female's attacks on creatures passing nearby become more intense, because she isn't gathering food just for herself. The food is for her *brood*." The audience shivered. I had them, now, and I enjoyed it.

"When the female lays her grey, melon-sized eggs in the body of the male, she burrows into the side of the nesting lair to secure a place for the winter. The eggs hatch shortly after they're laid, and the young mature rapidly. The newborn anhkhegs feed upon the male for the duration of the snows; in the spring, the

young feed on the rotting food that has been stored over the winter by the mother. The mother cares nothing for her young once they've passed that first season, and as soon as she can, the mother chases them from the nest.

"In short, if that is a female, you *must* keep the mother from roaming and wreaking even greater havoc on the countryside!"

The crowd was silent and white-faced. They waited for me to continue.

"You cannot take chances with the monster now. There are two alternatives open. The first one is to stay away from the field where it is, but occasionally send herd animals out onto the pasture, to keep the monster fed so that it doesn't wander. Then, about a month after the first snowfall, when the ground is frozen deep, you locate one of its tunnels. The anhkheg will be hibernating until spring, so you can go down into the tunnels and dispatch the beast and any eggs at your leisure. In hibernation, an anhkheg is helpless and hard to awaken, even if attacked. It will be hard to chop through the anhkheg's shell or carve off its legs and head, though picks and shovels might chop into it well enough. Long knives would be slow, but —"

"What about lumber saws?" asked the youth suddenly. He was uncommonly quick.

"Yes! Any lumber saws you have will do the job," I said, recalling some bit of lore from a ranger who visited the academy. "You'll have to work fast, and saw at it with all your might. When the anhkheg is bereft of most of its important body parts, cover it with any flammable liquid, like oil or alcohol, and light it up. Get away from it, as the heat of the fire will awaken the anhkheg if it's not totally cut into little pieces. But, provided you soaked the beast in fluid, the fire should finish off what you started."

"Why can't we just cut it up and not worry about the fire?" asked the farmer with the leg bandage.

I glanced knowingly in his direction. "There usually isn't enough room in the hibernation chamber to get all the way around the anhkheg. Never leave a monster's fate to chance."

"Mister wizard!" started the old woman who had spoken up earlier; "The winters around here aren't really cold at all, and the ground only freezes down to about a hands span. Is that gonna be enough to put that thing out there to sleep, huh?"

Oh, the best-laid plans of mice and men . . . I questioned the old woman about the weather, then sighed. "From what you say, I fear that it would be hard to predict when or if the anhkheg would hibernate. I have heard that some do not if the snows are light." Everyone's face fell at that. Arguments broke out across the room as the farmers tried to decide what to do next,

"Listen to me!" I shouted above the rising buzz. "You have one final option!"

Immediately, to my relief, the noise began to subside. This was indeed their last option — aside from hiring adventurers to destroy the anhkheg, which would cost every last copper piece these wretched people had.

"Before it settles in for a coming winter, whether it is male or female, and whether it hibernates or not, an anhkheg must shed its old skin, in order to grow larger for the next season. This period is when it's most vulnerable. As soon as it has shed its old shell, the anhkheg secretes a smell distasteful to predatory monsters and other anhkhegs. It does this so that its natural enemies stay away from it while its shell is soft." I could see questions forming on several lips, and I wanted to answer them before the onlookers could interrupt.

"Having fed itself upon live meat for a time, the anhkheg must rest, lose its old shell, and strictly avoid any activity which could deform or damage the impressionable new armor. For nearly a full week after it sheds, the shell has the toughness of a freshly tanned side of pigskin. In an underground environment, the shell dries much more slowly than it would in the air. Furthermore, the animal is sluggish as its body struggles to rebuild itself. Most of its energy is used up in the process of hardening its shell, making it slow to react. It cannot use its acidic spit, as its stomach contents are being digested to give it its needed energy.

"You must set up a watch on the field to keep track of the beast's activities, and regularly give it some sort of animal to keep it happy. When it doesn't show for a couple days, even after animals are released on the field, see if you can detect the smell it gives off to keep others like it away."

One old woman cocked her head, eyeing me thoughtfully. "Sire, a question. This smell it makes — you can smell it through the soil itself?"

I nodded. "Yes. It is quite strong."

She squinted her eyes. "And what does it smell like?"

I remembered the odor from school and wrinkled my nose. "It's very pungent, rather like rotting fruit."

The old woman broke into a toothless grin. "I was down by the field this morning, and I smelled rotting fruit real strong, but I didn't know where it was coming from. And we ain't seen that ankee for three or four days now!"

You could feel the atmosphere change as she spoke. "That may be the sign," I said. "If so, you're in luck. All you need is the courage to enter its tunnels and slay the vermin. It is in your hands!"

My voice was drowned out by a large cheer, then by loud, excited planning and talking. Within minutes, the hall was empty as the heartened crowd evaporated to go anhkheg-hunting — save for myself.

I reflected that I had accomplished my mission, but at a price the baron would

not be pleased to pay. If they conquered the anhkheg, his subjects would see less use for a baron who refused to deal with monsters personally. If this kept up . . . I thought of the brawny youth with the quick mind and outspoken manner. Would I someday serve him, instead?

I collected my things. It was then that I noticed one other person in the hall with me — a girl about eight years old.

"Aren't you going to kill the anhkheg, too?" I asked her jokingly.

"Nope!" she said, her disgust obvious, "I hate bugs!"

Notes

1. In basic appearance, the anhkheg resembles a large praying mantis. This giant insect has a hard chitinous shell which covers the top portion of its body for AC 2, and a soft underside with AC 4. The hardened shell of the anhkheg appears in a variety of colors, ranging from yellow to brown to gray; the soft underside appears in various shades between red and pink. Like the praying mantis, the anhkheg has two sets of two legs each, and one set of forelegs which it uses for digging and in combat. The anhkheg also uses its forelegs to hold small prey while attacking with its mandibles.

As the anhkheg grows each year, it sheds its hard shell for another, larger shell. It is at this time of year — usually in the fall — that the anhkheg is most vulnerable. The anhkheg sheds the shell in a day or two; thereafter, it takes 1-2 weeks for the new shell to reach the hardened consistency of the former. During the first week, the anhkheg's armor class is diminished to 5 for the topside and 7 for the underside. One week after this, the shell has hardened to its normal consistency.

During this molting period, the anhkheg is very sluggish as its body struggles to cope with and adapt to the rebuilding of its exoskeleton. During this two-week period, the anhkheg's movement is half its normal rate (6" above ground). Likewise, the damage doled out by its mandibles is roughly half the normal figure (1-10 as opposed to 3-18). The anhkheg cannot use its acidic spit at this time as well. In the process of revitalizing its exoskeleton, the anhkheg refrains from digging, as this may cause damage to or otherwise deform its impressionable armor. As a result, no figure is given for underground movement during this period. To protect itself from predators or other anhkhegs (who may attempt to evict the shedding creature from its lair, or feed upon it in its weakened state), the anhkheg secretes an odor which is repulsive to these possible predators. This odor (which is the result of the anhkheg's shell-hardening enzyme) smells vaguely like rotting fruit to humans. Because of this aroma, most other creatures (except for some mammals and the most desperate predatory insects) avoid the anhkheg during this period.

The size of the anhkheg varies with age

and health, and is directly related to the number of hit dice the individual creature possesses. For instance, a 3-HD anhkheg is roughly 10' in length, whereas a 4-HD specimen is roughly 12'. This length increases in 2' increments with each additional hit die, with an 8-HD anhkheg being approximately 20' in length. Generally speaking, an anhkheg is half as tall as it is long; thus, a 16' long creature is 8' in height. As an additional note, the anhkheg's hit dice are almost directly proportionate to the creature's age. For the first six months following birth, the anhkheg has 1 HD; in the second six months, the creature has 2 HD. For every year of age following, the anhkheg gains another hit die until it reaches 8 HD, at which point the creature no longer grows. Anhkhegs usually do not live any longer than 10 to 12 years; these giant insects grow quickly and, as a result, live a relatively short time.

In climates where winters are particularly severe, the anhkheg hibernates through the cold season. Within a month after the first snowfall, the anhkheg enters its lair to hibernate. During this time, the anhkheg does not need to eat or burrow; instead, it lives off the supply of protein and nutrition it has built up in its system over the fall (part of the reason that the anhkheg is most active in its predation in the autumn). In this stage of existence, the creature can remain under-

ground without detection for the entire cold season, returning to the surface once more when the first signs of spring present themselves. In climates where winter is not a serious factor, the anhkheg remains active throughout the year.

2. In addition to activity in preparation for hibernation, autumn is also the mating season for the anhkheg. In the late fall of each year, the male anhkheg seeks out a female partner. This search is facilitated by the female's secretion of an odor which attracts the male anhkheg, drugging the insect with its aroma. In its dazed and sluggish state, the male fertilizes the eggs — and is immediately slain by the female. Dragging the male into a widened, dead-end tunnel, the female cracks the male's underside with its sharp ovipositor and plants the eggs in its body.

The female anhkheg lays 2-12 eggs in one laying, 75% of which are fertile and will hatch successfully. These eggs, which are gray in color and about 2' across, hatch within one month — usually before the female adult begins hibernation. During the winter months, the newborn anhkheg (known as "nymphs") feed off the corpse of the male and grow as described earlier. Within the first three to four months of life, the newborn anhkhegs take on the appearance and abilities of the adult. Within the first year, young anhkheg are able to bite for 1-4 hp damage, with an additional 1-4 hp damage per turn from digestive enzymes. They can also spit, and their digestive acid does 2-16 hp, damage, with adult ranges- In addition, the adolescent anhkheg's AC is 4 overall and 6 for the underside for the first year; thereafter, AC is as stated in the *Monster Manual*.

3. Although the anhkheg is generally an unintelligent creature, it does have some physical advantages and a few instinctive bits of cunning that aid it in its predation. As stated in the *Monster Manual*, the anhkheg burrows through the earth, preferring soil rich in minerals and organic material. For the most part, this diet of mineral and vegetation provides the bulk of the anhkheg's nutrition. Still, the insect supplements its diet with regular helpings of fresh meat (usually livestock, though sometimes humans and other accessible beings). Although the anhkheg's mandibles are not capable of tearing meat, the anhkheg is able to break down its meals with the aid of a strong digestive fluid — a fluid which it also uses in combat.

A favorite tactic employed by the anhkheg involves burrowing 5-10' under the earth's surface and lying in wait until it detects a potential victim passing overhead. Usually, the anhkheg burrows close enough to the surface to allow its antennae to poke up through the softened soil. The anhkheg's antennae are extremely sensitive to vibration, a sense that fully replaces hearing (the anhkheg is otherwise deaf). So sensitive is this sense that the anhkheg is capable of detecting the ap-

proach of a man-sized creature from as far away as 300'; it can detect smaller-than-man-sized creatures from as far as 100', and creatures larger than man-sized from as far away as 500'.

As an added advantage, the anhkheg has superior eyesight due to its compound eye structure — though such vision is quite nearsighted. The hundreds of small, black lenses in its eyes allow the creature to see with great clarity in gloom or at night with 6" ultravision (this sense is lost when underground, however). Above ground, in full daylight, the anhkheg's eyesight allows it a visual range of only 12".

In burrowing, the anhkheg utilizes its mandibles for digging, breaking down larger minerals with its digestive enzymes and moving the earth with its forelegs. The anhkheg eats as it digs, disposing of the minerals by digesting them. For the most part, an anhkheg burrows continually; the creature seldom stays in one place, unless hibernating, nesting, or waiting for prey. At all other times, the anhkheg digs through an entire area at a variety of depths and angles before moving on to another place. As a result, it is not uncommon for an anhkheg to take up temporary residence in a farmer's field or in a forest bed until it has cleaned the area of most of its nutrient-enriched soil. An anhkheg seldom burrows below a depth of 40'; below this level, it starts to meet with hard-packed soil that is both difficult to move through and distasteful to the creature; furthermore, below this point, the water table of the land makes movement difficult, if not impossible.

4. Because of the anhkheg's nomadic nature, the creature's lair usually consists of no more than a series of labyrinthine tunnels — some of which may have collapsed, others of which are still in use. For the most part, the anhkheg does not lair in any one particular habitat, except when nesting or going into hibernation. In these cases, the anhkheg usually converts a dead-end tunnel into a small lair by widening the corridor to accommodate its purpose. Nesting lairs are fairly large constructs, being 10-12' in height, 20-25' wide, and 60-80' in length (room must be allotted for the male anhkheg's body in addition to the female and her young). A hibernation lair is usually much smaller, being roughly the same size as the anhkheg itself (this allows the anhkheg insulation against the cold by providing the earth as a buffer).

Anhkheg tunnels resemble a maze in their random design; although these corridors wind in relatively straight paths, they change depth, intersect with other tunnels, and often end abruptly. There are usually only one or two entrances into the tunnels, though others sometimes appear when the anhkheg bursts up from beneath the surface to surprise its prey. The tunnels are generally only as wide and tall as the anhkheg itself, about 3-6' wide and 4-10' high. Because of the terrain in which

they are built, these tunnels are often very unstable and are prone to collapse. Consequently, characters investigating these passages should be cautious; one wrong turn, and they could wind up with an early burial.

Treasure in the anhkheg lair is usually incidental, being left behind by the anhkheg's victims and generally ignored by the insect which, because of its animal intelligence, has no desire or use for treasure. As a result, there is no such thing as an anhkheg's "hoard." Monies and magic left behind by victims usually remain with the victim's remains — that is, those items which have managed to survive the effect of the anhkheg's digestive enzymes. All belongings on a victim's body must save vs. acid in order to survive the anhkheg's acidic secretion; those that do not are simply devoured along with the victim. Any surviving accoutrements or treasures are discarded by the anhkheg; these will often be found at various points in the anhkheg tunnels. Items found are usually at the point at which the victim was consumed.

5. Because of its unique composition, the anhkheg's body provides a number of "natural treasures." For example, the hard, chitinous shell of the creature makes extremely good armor. If cured and preserved properly (otherwise, the shell withers and dissolves with time), the shell maintains an AC of 2 or 4, depending on which area of its body is used. This armor is equal to scale mail in weight and encumbrance, though it offers protection equal to that of plate mail.

The anhkheg's eyes (and the fluid therein) are useful to alchemists and magic-users in the creation of sight-related magic potions and items. Likewise, the anhkheg's digestive acid can be salvaged and utilized as a regular acid. This chemical maintains its properties for up to six months after the anhkheg's death, delivering 1-4 hp damage and limited as listed in the rules regarding acid in the *DMG*, pages 64-65 and 80-81. This chemical can only be carried in a glass container and is highly susceptible to breakage as a result.

There is a secondary enzyme sac located in the creature's head, very similar to a small, acid-resistant bladder. Recovering this fluid from the anhkheg requires very adept hands, as it is very easy to break this sac accidentally. Failure to successfully remove the sac without breakage results in damage to the handler.

Aside from this, the anhkheg's mandibles make reasonably good axe-heads, and its legs (if cured and preserved) may be used as maces and other concussive weaponry. By removing out the meat inside and replacing it with some substance to provide weight (sand, metal, etc.), these appendages can be formed into weapons delivering the same damage as their counterparts.

The Ecology of the Carnivorous Ape

Illustration by Jim Holloway

Excerpt from "Beasts of the Far Southlands," by the sage Fabius:

There are many types of apes in the tropical lands, but the carnivorous ape is the most notorious and legendary. Many fables are told of this primate's ferocity and lust for human flesh. The truth is less fantastic, of course; the carnivorous ape lives in remote areas and has rarely been studied. At one time, it was thought that apes were all vegetarian and that the carnivorous ape was an anomaly. Now it is known that all apes will eat meat to varying degrees, just as bears do. The carnivorous ape is simply a carnivorous member of an otherwise omnivorous family.

It was my good fortune to have made friendship with a clan of Watanga tribesmen. These so-called savages live on the fringes of the southern Hepmonaland jungle, and my temporary residence there gave me an excellent opportunity to study a family group of carnivorous apes that roamed the nearby wilderness. The results of these two years of research are given here.

Description

As is well known, carnivorous apes have a superficial resemblance to gorillas. They are tall, broad, heavily built, and covered with long, black hair. Albino carnivorous apes are occasionally seen. Male apes stand up to 7' tall and weigh up to 625 lbs. Females are somewhat smaller, averaging 6' and 500 lbs.¹

It is the physiology of the jaws that shows the greatest distinction between carnivorous apes and gorillas. The mouth of the carnivorous ape is a bit longer and drawn out than in gorillas, almost becoming a muzzle. The teeth are long and sharp, with pointed incisors and canines designed to cut and tear flesh. The ape is a gluttonous eater, tearing off and swallowing chunks of flesh with every bite.

This ape has very keen senses, as befits a carnivore. The senses of sight and smell

The lords of the savage jungle

are comparable to those of the great cats. The ape's hearing is also keen, making it hard to approach a group of these beasts undetected.

The arms and legs of the carnivorous ape are longer though nearly identical to those of the gorilla. Surprisingly, this ape has bony nails which curve into the form of claws; this is unusual in a primate.

Like all apes, the carnivorous ape is incredibly strong. An adult male is capable of dragging a buffalo carcass for miles into the jungle. One ape was seen rolling an elephant's carcass over in an attempt to get it closer to a group of protective trees. Carnivorous apes can thus easily carry off a man, if they choose to do so.

Life and habits

Female carnivorous apes give birth to single young (rarely two) once every five or six years. The young are fully dependent on their mothers for three years. During this time, they cling to the hair on their mothers' backs, only rarely moving away from them. At the age of four to seven years, the young gradually learn to move around in trees and hunt, gaining full independence at age eight. Full maturity comes at the tenth year.

As far as is known, carnivorous apes may live up to 40 years of age. The elderly are easy to pick out; as the apes get past 30 years of age, their hair gradually turns gray at the tips. The oldest individuals have a dark silvery coat, and with practice an observer may note distinctive facial and bodily characteristics of individual apes.

The life habits of the carnivorous apes are an odd mixture of those of the leopard, lion, gorilla, and bear. This is a result of their size, diet, and intelligence. Like other apes, the carnivorous ape lives in small family groups, usually numbering around eight adults but sometimes reaching numbers as high as 20. Within these groups, there is about a two-to-one ratio of females to males. The leader of the group is the largest male. The leader is often challenged by young males in nonlethal wrestling matches; defeated challengers are driven off and usually (but not always) join another family group. Defeated leaders leave the group and live a solitary existence for the rest of their lives, becoming a particular danger to humans dwelling nearby.

Within the family groups, the males are dominant. They get the choice parts of killed game and the best sleeping areas. When a kill is brought in, the males eat their fill first, followed by the females; the young are last to feed. In times of scarcity, many of the young starve to death.

Carnivorous apes do not establish actual lairs, but family groups do have large territories over which they widely roam. The size of the territory is about one to three square miles per adult in the group. The male apes mark their territorial boundaries by scarring tree trunks with their nails, and also by releasing a musky

scent from glands in their cheeks (carnivorous apes releasing this scent appear to be hissing with open mouths at trees or objects they are marking).

Since carnivorous apes are not vegetarians, they do not live in the depths of the jungle where little game is found. These apes roam areas where the jungle is broken by hills or by the edge of the savannah, where much more game is found than deep in the rain forest.²

The diet of the carnivorous ape is varied. The apes will take almost any kind of meat they can get. Rodents make up nearly one-third of their diet. Another third is made of things like carrion, snakes, tortoises, eggs, lizards, fish, and the larvae of giant insects. Thus, two-thirds of the carnivorous ape's diet comes from individual foraging. The apes depend greatly on such foraging because of their size, which makes it necessary to have a large intake of high-protein food.

The remainder of these apes' diet comes from killed game. In this respect, the carnivorous apes are like lions; they drag the kill back to the group so all may eat. The apes may hunt either in groups or singly. Whenever a herd of large game such as buffalo or wildebeest wanders close to the apes' territory, all adult apes join the hunt, except for nursing mothers. More often, the only game available consists of antelope and warthogs. One group of apes was seen attacking a giraffe, although the intended prey viciously kicked several of the hunters and was able to run away.

Carnivorous apes do not wander very far from their protective trees, due to their fear of lions. Although one ape is a match for one lion, the apes generally act to protect the weaker members of their family groups. Leopards do not seem to be a major competitor, even though the leopards and apes are both tree climbers. Where they coexist, the leopards usually take the smaller, faster prey that the apes can't catch. However, it should be noted that carnivorous apes are capable of short bursts of speed and can easily outdistance a running man.³

When hunting alone, the apes depend on stealth. They often hide in trees overlooking trails or water, then leap out at creatures passing by.⁴ At other times, the apes hide in grass or bushes, dashing out at their prey in hopes of catching it by surprise. Whatever method is used, the prey is doomed once the ape's great strength and sharp teeth come into play. Rending and breaking limbs is an often-seen tactic when a carnivorous ape means to incapacitate a foe.

Carnivorous apes and men

The carnivorous ape has a reputation for man-eating. While this is true to some extent, by no means do they all eat men. The apes can be compared to tigers in that individuals will occasionally turn into man-eaters, while the majority do not. Most of

the man-eaters are solitary apes who were injured in some way, so as not to be able to catch other prey; such apes are usually defeated leaders cast out of their tribe.

Occasionally, however, an entire family group will turn into man-eaters. These groups are greatly feared by the native tribes. The apes' cunning allows them to make devastating raids on villages and caravans. Palisade walls are no protection against climbing apes. One group of 18 carnivorous apes attacked a slaver camp at night, silently climbing the walls. Once inside the camp, the apes tore apart huts and smashed tents flat. Out of 32 slavers, 28 were killed, along with 50 manacled slaves. The other six slavers saved themselves only by fleeing headlong into the jungle, somehow escaping undetected.

Although carnivorous apes may hunt men, men may also hunt the apes. Unscrupulous natives search out small family groups, spear the adults, and capture the young. The young are sold to similarly unscrupulous traders. This is how carnivorous apes end up in places far from their native jungle, such as hobgoblin lairs and hill-giant clans. Carnivorous apes appear to be more adaptable than their gorilla cousins, and they may even thrive in foreign, temperate areas where old forests are found.

Even stranger are the natives who worship carnivorous apes. One tribe believes that killing a carnivorous ape brings great luck and courage to the slayer; thus, one of their rites of manhood is to kill a carnivorous ape. Another tribe is known to regard the apes as sacred. This latter tribe keeps carnivorous apes as pets and feeds captives to them; such apes wander the tribal village freely and are said to be well behaved and friendly — to the villagers only, of course.

In summary, it should be seen that carnivorous apes are merely another jungle predator, instead of the bloodthirsty man-eaters of legend. However, their size and intelligence make them creatures to be wary of. Wandering through their territories is a perilous undertaking, for a single male ape is the equal of a half-dozen men-at-arms.

Notes

1. Treat female carnivorous apes as gorillas for hit dice and attacks, but allow them the same keen senses as the males.

2. Carnivorous apes can move through trees (brachiation) at a rate of 10". They can also run an 18" sprint, but only for one round. This sprint is used when the ape leaps out of an ambush; if attacking in the same round as it sprints, the ape's attacks are at +2 to hit for that round, but its armor class drops from AC 6 to AC 7.

3. When hiding in ambush (in grass or up in trees), the carnivorous ape has a 50% chance of surprising its prey.

4. When the ape hides in a tree and leaps down on its prey, the prey (if hit) takes 2-8 hp damage from the impact.

THE ECOLOGY OF THE ASPIS

Statement of Explanation

Query: What do you
give a six-foot-tall
bug monster that
wants to trade?

Statement of fact:
Anything it wants.

by
Johnathan M. Richards

Brad McDevitt

KARL THE WOODCUTTER WAS USED TO SOLITUDE. Every day, he left his small cottage in the woods with some bread and cheese wrapped in a clean cloth for his lunch and his trusty ax upon his shoulder to go fell trees. He was used to the sounds of the forest: the chirping of the birds, the chatter of the squirrels, his own grunts as he swung his ax with a rhythmic efficiency. He was used to the smells of woodcutting: the clean scent of the freshly-cut pine, the heavy, woodsy smell of growing things, even the presence of his own sweat as he toiled at his work. He was used to the forest's inhabitants: the chipmunks who watched him with a wary eye, the dragonflies that buzzed through the air in a frantic dance of shining colors, even the occasional deer seen in the distance.

He was therefore surprised when a trio of giant insects approached him one day.

These were like no insects he had ever seen before. For one thing, they walked upright on their hind legs. Their stocky bodies were covered in a hard, chitinous armor like beetles, only theirs was grayish-white, like no beetle he'd ever heard of.¹ They reminded him of weevils, with their elongated probosci and the two short, stubby antennae poking up halfway down their narrow faces—only weevils as big as he was, nearly six feet tall.

With a grunt, Karl pulled the ax from the tree he had been chopping—his

younger days, alas, were behind him—and waved it in what he hoped was a menacing fashion at the insect intruders. "Keep away," he warned.

"Kee paway," agreed one of the bugs.

"I mean it," Karl said, drawing his weapon back by his shoulder, ready to swing if they came closer.

"I meenit," replied the bug sagely, to which one of his companions added, "Kee paway."

They advanced upon the woodcutter, and Karl swung his ax. Had the lead bug been a tree, the ax would have sunk into the trunk with a satisfying thunk! However, the bug merely grabbed the ax handle in its two left hands² and deftly

1. The chitinous armor covering an aspis drone's body provides excellent protection from harm. Not only does it give the creature a natural AC of 3 but

also it makes the aspis immune to cold and electricity and halves any fire-based damage taken.

2. Aspis drones have manipulatory claws at the

pulled it from Karl's grasp. Karl, unarmed, was unable to prevent the two other bugs from rushing him. He tried fighting them off, but their eight arms against his two were too much. He was lifted from his feet and carried, arms pinned, between the two upright insects while the third examined his ax and the tree he had been chopping. "I meenit," the bug said knowingly. Then, by some signal that Karl was unable to fathom,³ the one bug motioned the others to depart, and off they went, taking the old woodcutter with them.

The trip was brief and uneventful. In less time than it would have taken Karl to eat his lunch, the bugs arrived at their destination and dropped him down a hole in the forest floor. Karl slid down an angled shaft that led into a large chamber. It was dark there, lit only by the feeble rays of sunlight filtering down from the entry shaft above.⁴ Before the woodcutter could get his bearings, two more bugs came at him from out of the darkness and held him in place while his three escorts climbed down the shaft. "Confound it, let me go!" he exploded, struggling with his captors.

The bug with Karl's ax approached, staring into his face with multifaceted eyes. "Con foundit. Let meego." When that got no response from the old man, he tried "I meenit. Kee paway." Karl only stared at the bug, a look of confusion on his weathered face. The bug stared back at him for a short while, then, again at some signal that Karl missed, his two captors dragged him away to a chamber deeper in the nest.

The drone approached the cow's chamber, ready to give his report. As usual, it was pitch black in the chamber, but that didn't bother him. He could smell the cow's presence, picking her unique scent out of all the others. If that wasn't enough, he could feel the thick liquid that covered the walls and floor of the cow's chamber oozing between his feet.⁵ "Statement of fact: We have captured a human, as ordered," he reported to the cow in the scent-language of the aspis.⁶

"Feeling of strong satisfaction: Good. Query: Has it been taken to the learning chamber?"

ends of each of their six limbs. Each can be used as a hand, although generally only the front four limbs are used as "arms," and then only when the drone is walking upright. This allows the drone to use two-handed weapons (usually short swords or hand axes) and two shields when standing erect.

The shields are both held on the same side, with the weapons held in the arms on the other side. (Like humans, aspis drones can be right-handed or left-handed.) Aspis do not hold a shield and a weapon on the same side of the body, as the shield interferes with the weapon's movement. Optionally, they may eschew shields and employ two crossbows, firing one and reloading the other each round.

If an aspis drone must fight without weapons, it strikes with two of its claws per round, inflicting 1-4 points of damage with each successful hit.

3. Aspis communicate among themselves via a language of scents, which they produce from glands in their bodies and detect with their extremely sensitive olfactory sense. Humans are unable to pick up even the slightest traces of these chemical scents and so are generally unaware of aspis "speech." Fortunately, about 5% of the aspis drones in a given nest are able to speak a basic form of a spoken language—generally the common tongue of a given area.

4. Aspis nests are underground, not far below the surface. Typically, they consist of a primary entrance leading to a central chamber. From this chamber radiate several low passageways. One leads to the egg chambers and grub hatcheries. (There are usually 1-3 of the former and 1-6 of the latter, depending on the size of the nest.) Another leads to the granaries (2-4 per nest), where foodstuffs are stored. The third leads to the chamber of the "cow"—the aspis equivalent of a queen in an ant colony. There are side passages along each of the tunnels, leading to chemical preparation rooms and small storage areas where the nest keeps its shields, weapons, and any treasure—although many aspis nests do not realize the value of gems and coins and treat them as debris.

Normally, none of these underground chambers is lit, except for what little light filters down into the central chamber. This doesn't bother the aspis drones, who are able to maneuver in the dark using their excellent hearing and olfactory senses. (Aspis drones receive the equivalent of the Blind-Fighting nonweapon proficiency.) However, most aspis nests have several "escape routes"—vertical tunnels leading to the surface, whose camouflaged "trap doors" can be opened to let light into the chamber directly below. The chambers directly beneath these escape tunnels are generally left empty, so that the rooms may be put to various uses as the need arises. If otherwise empty, these rooms contain at least one aspis drone on guard duty to prevent enemies from infiltrating the nest.

5. Just as each ant colony has a single queen, each aspis nest has but one cow. The cow is the only female in the entire nest, as all drones and larvae are male. Physically, the cow is similar to the aspis' larval stage, looking like a giant, 15' long maggot. Cows are pasty white, the result of living an entirely underground existence.

The cow, while less intelligent than the drones, is nevertheless in complete charge of all aspects of aspis life. The cow gives a basic command, and the smarter drones figure out how best to fulfill it. As the cow is responsible for laying the eggs that keep the nest functioning, a drone always fights to the death to ensure his cow's safety.

Although cows never leave their chambers (and are therefore almost never encountered by other races), they are quite able to defend themselves. Lacking eyes, they can track prey through their sense of smell and attack with their enormous jaws, inflicting 3d6 points of damage. In addition, they exude a thick, white, corrosive liquid from their skin. This liquid coats their bloated bodies and the walls and floor of their chamber, and eats through metal or wood in a single round. If it comes into contact with living flesh, it inflicts 1d8 points of damage per round until washed off. All aspis are immune to the corrosive properties of this substance—in fact, if the

"Statement of affirmation: Yes."

"Command: Learn his strange manner of communication. Clarification: I wish three drones to learn; instruct the two that went with you to learn as well."

"Statement of undying obeisance: It will be done."

"Feeling of satisfaction: Good. Command: You may go."

The next few weeks were trying for the three drones. There were difficulties with the human from the start. He didn't like being in the dark, so one of the drones opened the trap door in the tunnel overhead to let in sunlight. He immediately tried escaping up the shaft and had to be dragged back down. He was finicky, refusing to eat tree bark and the specially harvested mold from the granaries.⁷ Even after conveying to the drones the concept that he ate animal flesh, he balked when they offered him meat from a dead drone. Nor did he want to dig for earthworms or beetles in the soil of the nest. In the end, he seemed satisfied with fruit and nuts brought from the trees in the forest.

nest is invaded, drones often coat their claws in the substance before attacking enemies, enabling them to inflict an extra 1d8 points of damage on the first successful attack.

In the event of the cow's death, the drones cut open her body and remove a chemical substance from her brain. This is then fed to one of the larvae; the substance causes a change of sex in the grub and stimulates rapid growth. Within a month, the grub achieves normal size for a cow and assumes the cow's place in the nest.

6. The aspis scent-language provides a great amount of information in a short period. Certain specific scents are used as "words," while others are modifiers, denoting the type of information being conveyed, the verb tense, and so on. Thus, a sentence like "The enemy is attacking!" would be conveyed by the "scent-words" for "enemy" and "attack," along with an overall modifying scent denoting present tense and another denoting urgency.

When an aspis learns a spoken language, it tries putting its words together in a similar fashion. Thus, a speaking aspis with a large enough vocabulary usually begins each sentence with the sentence type or the feeling behind the information about to be transmitted verbally, followed by the words of the sentence itself. For instance: "Query: What are you doing?" or "Statement of personal belief: You probably shouldn't be doing that" or "Overall feeling of contentment: That was a good meal."

7. Aspis are the epitome of the omnivorous creature, deriving nourishment from nearly any organic substance. Their digestive systems are very efficient, and they are not as squeamish about their meals as humans are (well, most humans, anyway). An aspis doesn't always bother killing its food before eating it—small insects, spiders, and worms are eaten alive. Even slain aspis drones are "recycled" by becoming food for the nest—if not the drones, then the larvae that swim in the grub hatcheries. The cow has her food brought to her in her chamber; she is not fussy about what she eats, so long as there is a lot of it.

Shortly after the sun went down, though, the human closed his eyes and lost consciousness. When the drones went to check on him, he started screaming and thrashing about. They backed off, afraid to hurt him, and he huddled in a ball and soon lost consciousness again. After a quick huddle, the drones decided to leave him alone for a while and see what would happen. He stirred and mumbled, tossed and turned, but eventually settled into one position and began making strange, rhythmic noises in his throat. Fortunately, when the sun came up and light filtered into the room, the human regained consciousness. The drones regarded it as a strange human trait, and they carried on with their lessons.⁸

The language learning started slowly, but gradually the drones built up a small vocabulary and learned to string words together. At first, they merely repeated everything that the human said, a trait that irritated the old woodcutter. Once he learned that they weren't going to harm him, though, that all they wanted from him was to learn to speak his language, things progressed more smoothly. In fact, Karl seemed to warm to the role of language teacher, as if realizing that the faster he finished the lessons over with, the sooner he'd be a free man. Indeed, he found himself growing oddly attached to the insect trio, for he sensed that they earnestly wished to expand their knowledge by learning to speak. He could respect that.

As for the drones, they were apt pupils. How could they not be? Their leader had told them to learn, so learn they did, devoting all of their attention to the task at hand.

After learning all of the words for parts of the body (both Karl's and the drones'), and the words for the objects in the learning chamber ("rock," "dirt," "shaft," "tunnel," "trap door," "bug," "human," "man," "Karl"—these last three causing some confusion for the drones, who didn't understand the concept of personal names and therefore used the three terms interchangeably⁹), the drones began bringing objects into the room and having Karl identify them. "That's an ax," he would say, and the drones would nod their heads sagely and repeat "Ax. Yes. That's an ax," or "That's an ax. I mean it."

After that began an intense series of pantomimes, wherein the old woodcutter tried to express certain concepts: "big," "small," "old," "young," "eat," "drink," "sleep," "hunt," and so on. The insects seemed intrigued by the game, often copying the gestures and maneuvers as well as the spoken words.

Finally, the drones led their human guest/captive/teacher on a tour of the nest. In the granaries, they learned the terms "mushroom," "mold," and "disgusting crap" but didn't fully understand the difference between them. Moving on to the egg chambers, they learned "egg," "baby," and "hatch," with Karl performing a pantomime to

get the last two words across. As the drones repeated the words, a pair of giant ants entered the egg chamber. Feeling the eggs with their nimble antennae, the ants turned a few over and selected one of the biggest. Working together, they began dragging the egg down a narrow corridor to one of the grub hatcheries.¹⁰

Following the ants and their precious cargo into the hatchery, the drones inadvertently learned the words "vomit," "sick," and "stench," after quizzing Karl on his reactions to the room.¹¹ They quickly decided to move the tour to another chamber.

Still, all in all, progress was made, and finally the drones decided they had learned as much as they could under the conditions of the nest. One of the drones reported to the cow in her chambers.

"Statement of fact: Three drones have been taught to speak as much of the human language as is possible here in the nest."

"Feeling of contentment: Good. Command: Bring the human to me."

"Statement of undying obeisance: it will be done." The drone left, reappearing soon thereafter with Karl. They stood immediately outside the cow's chamber to prevent the acidic secretions from harming the human. Karl squinted in at the creature and said, "Cripes! She's as fat as a cow!"

"Statement of intention: I will question the human," said the cow in scent-language. "Command: You will translate."

To ensure a steady supply of food for the nest, mold growths are cultivated in several granaries in the nest. The granaries never lead to escape routes, so that they can remain in the darkness that promotes the growth of the mold.

8. Aspis do not sleep. They do rest, however, spending several hours at a time in a motionless state, conserving energy and purging fatigue poisons that build up in the body. Like all insects, aspis drones have no eyelids (larvae and cows don't even have eyes), so they remain aware of events in their fields of vision even while resting—although an aspis drone is more likely to detect someone approaching with his sense of smell or hearing than with his vision, which is somewhat poorer than that of a human. The multifaceted aspis eye was designed for detecting movement, so a Thief attempting to avoid detection by an aspis drone by using the Hide in Shadows ability and remaining motionless does so with a +10% bonus—provided he is out of "smelling range" of the aspis.

9. Aspis drones have no concept of individuality—a drone is a drone is a drone. They lack personal names and even distinct personalities. As far as the nest is concerned, a drone's life is immaterial, as any single drone is easily replaced by another.

Not all drones are identical, however. Within the nest, there are various functions that must be performed. While each drone must be able to perform any of the tasks required, some "specialize" in certain areas: defense of the nest, trap-building, speaking aloud to humans and humanoid creatures, scouting, tending to the mold cultures in the granaries or the grubs in the hatcheries, food gathering, and even breeding with the cow. A drone that has specialized in a particular task adopts a specific scent to identify its area of expertise; thus, "breeder" or "gatherer of food" serves as the closest equivalent a drone has to a name. Not all drones have such pseudo-names, however, and those names used aren't likely to be unique—a nest might have three "breeders" and seven "gatherers of food," for instance, any of which are interchangeable.

10. Many aspis nests include 1–10 giant ants (larger nests may have as many as 10–100). These insects are the spoils of war, stolen as eggs from a giant ant nest after a raid by aspis drones. Allowed to hatch in the aspis nest, the ants bond to the aspis cow, mistakenly believing her to be their own queen. Giant ants can understand simple scent-words of the aspis "language," enough to obey direct commands given by the cow. They do not enter her chamber,

however, being vulnerable to the cow's acidic secretions. Giant ants are most often used as food gatherers, egg tenders, and warriors when the nest is attacked. Only workers and soldiers are found in an aspis nest, never a queen, requiring the aspis nest to steal giant ant eggs on a regular basis to resupply their stock of ant slaves.

11. Aspis larvae resemble giant maggots, white or pale pink. They are blind and deaf, lacking both eyes and ears at this stage of development. However, they already have a highly developed sense of smell and use this to find edible food in the waters of the hatcheries. Each aspis nest has up to six grub hatcheries, each one housing up to ten larvae. The hatcheries are shaped like a shallow swimming pool surrounded by a narrow ledge. Hatcheries double as garbage pits, in which the drones pitch food scraps and other waste products. The stench of these hatcheries is so bad that nonaspis (other than giant ant slaves) must make a successful saving throw vs. poison upon entering or become violently ill until removed from the odor. (Incidentally, the aspis ability to tolerate such stench also makes them immune to *stinking cloud* and similar spells.)

Larvae have enormous appetites and eat almost constantly, growing in size over the course of three to

"Statement of comprehension: Understood."

"Query: Where did he get the weapon?"

The drone turned to Karl and said, "Where did you get the ax?"

"I bought it in the village."

"Bought? What is 'bought?'"

"I purchased it. With money. You know, coins?" The drone stared at the human in incomprehension. "I ... traded small bits of metal for it."

"What is 'village?'"

"Village, uh ... man-nest."

The drone switched back to scent-language. "Statement of partial confusion: He acquired it from his nest, by trading something of value in return."

"Query: Are there more of these weapons in his nest?"

"The cow speaks, 'Are more axes in the village?'"

"Yes."

"Statement of affirmation: Yes."

"Query: What will they accept as trade for the weapons? Explanation: Metal axes will allow the drones to better protect the nest."

After a moment's thought, the drone said, "The cow speaks, 'What things humans trade?' Bugs want axes bought for bug-nest."

"Beats me. You'd have to ask the blacksmith."

After a bit of further explanation, the drone passed, "Statement of possible understanding: The human is unsure and suggests we ask the question of the maker of weapons at his nest."

"Command: Go to the human nest and find out. Query: Would the human be of assistance in speaking to the others of his nest?"

"Statement of strong affirmation: Yes, my cow. Our grasp of the noise-language is not complete."

"Command: Then take him. The other two drones will remain here. If you are slain, I do not want to have to start all over. Now go."

"Statement of undying obeisance: It

four months until they reach 6 feet in length. At that time, triggered by instinct, a larva crawls onto the hatchery ledge and begins to metamorphosize. Over the next few days, it grows into an adult drone, which bursts out of the maggottlike outer larval shell. The drone then kicks the remains of this husk into

The bugs approached Karl, staring into his face with multifaceted eyes. "Con foundit. Let meego."

will be done, my cow." The drone turned to Karl. "We go to your village now."

"Praise be to the gods!" he said.

Karl blinked at the sunlight, the first direct sunlight he had seen in over three weeks. Scrambling up behind him came the drone, rising to stand upright once he cleared the entrance of the aspis nest. "Lead bug to your village," he said.

"First, we stop at my cottage," Karl said. "I want a bath and a decent meal

before I take you anywhere else." The drone had been given no time constraints by his cow, so he shrugged mentally and followed the woodcutter to his small dwelling in the woods.

"A 'cottage' is a small man-nest," he declared upon seeing it. "I understand. What is a 'bath'?"

"Wash with water. Remove dirt from body. Forget it."

The drone chalked it up as another odd human custom, like praying to unseen gods,¹² snoring, and the removal of liquid wastes from the body.¹³ While

the pool and leaves the hatchery to serve the nest in his adult form. The larval husk is devoured by other aspis larvae still in the pool.

12. The aspis subscribe to no religion. They are practical-minded, finding it difficult to believe in something that cannot be seen, heard, or smelled.

Cows and larvae care only about eating, and as for the drones, the cow is all the deity they need.

13. Waste material takes the form of small, white flakes that are shed from the aspis' abdomen. Their efficient digestive systems process all liquid intake (most of which is a by-product of the food they eat—

Karl went around to the rain barrel at the side of the cottage, the drone examined the interior of the man-nest.

There was little to see. A cot and blanket, a small table and chair, a wooden dresser—all items unfamiliar to the drone, who couldn't imagine what strange purposes they might serve. Mounted on the wall over the cot was a sword and a shield; these, at least, the drone recognized, for his nest had several such items, taken from slain enemies like the orcs and goblins who occasionally attacked drones gathering food in the forest. The cow, ever concerned about the well-being of the nest, desired many more such items.¹⁴

As the drone waited for Karl to finish his "bath," he studied the weapon and nibbled idly on the woodcutter's blanket.

"Now, let me do the talking," suggested Karl, as they approached the village.

The village of Barker's Grove was a small one, claiming little more than a single inn, two taverns, a blacksmith's shop and a cluster of tiny houses. The blacksmith's was closed; expecting this, Karl advanced upon the nearest tavern. It was late afternoon, and the streets were clear, so the first to notice the arrival of the aspis was a donkey tied to the hitching post. It brayed in fear at the creature's unfamiliar scent; the drone got a good whiff of the donkey and altered his own odor to mimic that of the beast. Convinced the danger had passed, the donkey snorted once and was silent.

"Thought I'd find you here, Aegon," said the woodcutter poking his head in the door. "C'mon out here a minute. There's someone I want you to meet."

Aegon finished his ale in a single swig, wiped his mouth with the back of his hand, and climbed off his stool. He winked at his wife Daphnia, the tired-looking waitress who served drinks at the tavern. She ignored him and carried

on with her business. *Whatever happened to us?* thought Aegon. *We used to be so close.*

The blacksmith stepped out into the open air, a ready retort on his lips. Instead, he took one look at the gray-white insect standing behind Karl, and his jaw dropped open.

"Aegon, I'd like you to meet ... well shoot, I guess he doesn't really have a name."

"I am a bug," supplied the drone helpfully.

Aegon just stared.

"You are a Karl," added the drone.

"No, I'm Karl," said Karl. "He's Aegon."

"Ay-gon. Aegon. Aegon is a human. Karl is a human."

"Right."

"I am a bug."

"Look, I thought we agreed I'd do the talking," said Karl.

"What's all this about?" asked the blacksmith, voice shaky with shock.

"The bug here wants to buy some axes. Wants to know what you'd trade for them."

"Axes are ... axes are a gold apiece. You know that."

"No, he doesn't want to buy. He wants to trade."

"Trade what?"

"Good question." Karl turned to the drone. "What would you be willing to give to Aegon in exchange for axes for your nest?"

The drone thought it over. "Food. We have many mushrooms and disgusting crap to spare."

"What the hell?" asked the blacksmith.

"Uh, forget it," replied Karl. To the drone, he asked "What else?"

"Goo."

"Goo?"

"White cow-goo."

Aegon looked questioningly at Karl. "They've got this white stuff that eats through flesh, wood, metal, you name

it," the woodcutter explained.

"What would I do with that?" Aegon asked.

Karl frowned. "Hmm. What else?" he asked the drone.

"Slaves. We have many giant ants; we could trade some for your axes."

"And what would I want with a giant ant?"

"They are useful. They will care for your eggs, and help them hatch into fat babies. They are also good food."

"Uh, it doesn't quite work like that with humans," said Karl.

"No deal," said Aegon.

"We can make chemicals," suggested the drone.

"What kind of chemicals?" asked the blacksmith. "You mean, like potions?"

"Potions? What is 'potions'?"

"Magic," Karl explained. "You drink the potion and something magical happens. You know, like you can fly, or turn invisible, like that."

"Bugs do not know 'magic.' But we can make many chemicals.¹⁵ We can make rats come or run away. We can make Karl vomit. We can make a creature smell like another creature. We can cause an attraction between two creatures. We can make—"

"Wait, hold it there a minute," said Aegon. "Cause an attraction between two creatures? You mean, like a love potion?"

The drone looked to Karl, hoping for an explanation. Karl ignored the aspis and spoke directly to the blacksmith. "You betcha," he said. "The bugs back at this guy's nest could whip up a potion that'd have the women falling at your feet."

Aegon rubbed his jaw. "Even Daphnia? You think it'd work on her?"

Karl grinned. "Looking to put the spark back in your marriage, eh, Aegon? Well, this love potion'll do the trick just fine—you'll be like newlyweds again. So whaddaya say? How many axes would that be worth to you?"

an aspis very rarely needs to drink water).

14. Aspis technology is rather primitive. They are capable of making simple wicker or wooden shields and often carve spears and javelins from straight shafts of wood, but metalworking is unknown to them, and they scavenge or trade for their metal weapons.

15. Although the concept of magic is unknown to

the aspis, they are adept at mixing natural concoctions that can simulate nearly any odor, even those not normally distinguished by humans at a conscious level. These "nonmagical potions" have a wide variety of effects. Some attract or repel certain types of animals; a favorite form of aspis vengeance against a town that has taken action against an aspis nest is to splash its walls with a sticky, yellow liquid

that not only attracts giant rats and similar creatures but also drives them into a wild frenzy, causing them to attack everyone they encounter.

To create a compound that affects a specific type of creature, the drones must first have some type of contact with that creature. They couldn't create a formula of scent to keep wolverines at bay, for instance, unless they had been within "sniffing distance" of a

"Ten."

"Not enough."

"Twenty."

"You're not being serious. Perhaps the bug and I need to take our business elsewhere. I'm sure there are smiths in the city that can spot a value when they see it; maybe we'd be better off doing our business there. Good day, Aegon."

"City? What is 'city'?"

"Big man-nest. Bigger than a village."

"Wait!" called Aegon. "How many axes do you want?"

Karl called a quick conference with the drone. He had estimated about a dozen drones at the nest; the aspis confirmed fifteen. So, fifteen drones, each carrying two axes, plus some extras for the newer drones as the larvae hatched ... "Forty axes. No more and no less."

Aegon thought deep and hard. That was a lot of work; he didn't have forty axes back in his shop and he knew it. He looked back at the inn, and thought of his wife working within. To be like new-lweds again ... "Deal," he said.

The drone reported back to the cow in the scent-language of their race. "Statement of unqualified success: I have arranged to receive forty axes from the humans at the man-nest."

"Query: What do they want in return?"

"Statement of bewilderment: A small quantity of what they term 'love potion.'"

"Query: Can we produce what they want?"

"Statement of affirmation: Yes, my cow. I have analyzed the human pheromones involved and can reproduce them in an appropriate elixir."

"Command: Assist one of the chemist-drones in such a preparation."

"Statement of undying obeisance: It will be done."

"Statement of satisfaction: Excellent. Command: After the compound has been made, exchange it for the weapons."

"Helpful input: I will require assistance to carry such a large load, my cow."

"Acknowledgment: You may take other drones to aid you."

"Statement of gratitude: Thank you, my cow."

"Command: After we have the weapons, you will leave the nest."

"Statement of bewilderment." The drone sent out scents of confusion and distress but could make no coherent scent-words to form a sentence. Had he offended the cow? Was he being exiled?

"Command: Calm yourself. Explanation: I have decided that access to the man-nests will benefit the nest. You will therefore go out into the world and explore. There might be other items available that will also be helpful. You will find them and return with them to the nest."

The drone found his scent-voice again. "Query: How long will I be gone?"

"Uncertainty: As long as it takes to find items of value. Clarification and return to certitude: In the meantime, we will begin trade with the man-nest on a regular basis. They may provide us with other metal items already known to us. We want shields, for instance. Annoyance: Enough explanations—go about your duties."

"Statement of undying obeisance: It will be done." As he left the cow's chamber, he could still smell the lingering words of their last conversation.¹⁶ Would that prove to be the last time he spoke to his cow? It was possible—who knew what kinds of dangers awaited him, alone in a world he barely knew? Still, the cow was the cow, and he could not defy her orders. He made his way to the chemical preparation chamber and prepared himself mentally for the task ahead.

The drone stood at the blacksmith's shop at Barker's Grove, watching as the Karl named Aegon counted out axes and placed them into the waiting hands of the three other drones that had accompanied him. Satisfied that all forty were accounted for, he passed over a vial of the chemical he had helped produce.

"Put some of this in food. Give food to partner."

Aegon rubbed his hands together in eagerness and accepted the flask. "It's been a pleasure doing business with you," he said, and sped off to the tavern.

The drone turned to his companions. "Command: Return to the nest and give the weapons to the cow."

"Query: Won't you be accompanying us?"

"Statement of negation: I have other orders."

"Acceptance: The cow must always be obeyed."

"Statement of agreement: The cow must be obeyed. Statement of sorrow: I will miss the nest."

The others turned and followed the dirt road leading out of Barker's Grove. As the drone watched his nest-brothers depart, he couldn't help but add, in the noise-language of the humans, "I mean it."

"C'mon, cheer up," said Karl. "It won't be so bad. You'll be back to your nest in no time, with a mess of stories to tell your little bug buddies. And in the meantime, there's a whole world out there for us to see and explore."

"You will accompany me?"

"You bet I will. I may not be the stalwart warrior I once was, but I can still swing a mean ax if I have to. And let me tell you, there's plenty for me to show you! Wait until you see the city—the big man-nest. The bakeries! The arenas! The marketplace! We can take a ride on a boat—you'd like that."

"And you will help me to learn the noise-language even better?" asked the drone.

"Sure I will," agreed Karl.

"Good. Then, what is 'business'? What is 'buddies'? What is 'stalwart'? What is 'bakery'? What is 'arena'? What is 'marketplace'? What is 'boat'?"

Karl sighed and shook his head as the they started down the road toward the city.

wolverine to capture its particular essence.

16. The scents that compose aspis "speech" remain in the air for a minute or two before dissipation.

tion. Thus, it is possible for a drone to enter a chamber and smell a recent conversation between others of its kind.

The Ecology of the Aurumvorax

Count your fingers after you pet it

I was enjoying an evening drink in the Red Lion, one of my favorite taverns in Goodway during the time I was indentured to Duke Radford, and was getting ready to let fly with the story of how I once wooed six maids at the same time when, much to the pretended relief of my companions, I noticed a dwarf at my elbow. His sword was drawn but lowered. I tried to ignore him, but he would have none of that; he was determined to interrupt me.

"Are you Faulkenson the mage?" he growled, as he thrust his face close to mine. He looked like he had just crawled from the gutter. His breath certainly smelled like it.

"Yes, I am," I said, as I moved my chair back a foot for fresh air. "And who are you and what do you want?"

"I have authorization to take you immediately to Duke Kaor. Come with me."

"Duke Kaor? What does he want?" I was bewildered. Kaor the Toad was a rival of my master; his territory lay adjacent to Goodway. How did he know of me? Maybe I *had*, on occasion, let fly with a tall tale about my adventures, but it was usually only to the group of close friends now at the table. I likewise doubted the Duke wanted me to perform a service; he employed much more powerful spell-casters than myself.

The dwarf looked at me blackly. "He only wishes to talk to you and has promised me gold should I find you. His reasons

are his own. Get up." Apparently, the little guy was having a bad day.

I looked at him straight on — easy enough while sitting down. "I'm really sorry, but I can't go with you. You see, I was just about to enlighten these—" I looked around the table and dismissed the word gentlemen — these companions of mine with the story of the time I met half a dozen rich, beautiful, young maidens and what became—"

My beloved companions had obviously had too much to drink and were in a particularly mischievous mood that evening, as they carried me to the dwarf's horse and tied me over its back. It must have been the drink. They usually couldn't get enough of me.

A few bumpy hours later, I stood before Duke Kaor. The dwarf had been paid off, and the Duke evidently thought me valuable enough to entrust me with four of his largest guards. We were now in the Duke's library. Around me were volumes on shelves that covered all walls except for that behind the Duke's chair of state. Golden statuettes and unusual devices of magic lay on the shelves and floor, almost hidden in the semidarkness. Moonlight filtered through the large panes of glass behind Kaor; it was now late indeed. Despite the candles on some of the shelves, Kaor's bloated face was silhouetted and obscured.

"What do you know about the aurumvorax?" he asked without preamble.

"What do you mean, sir?" I was more nervous than I had anticipated. The line of questioning caught me off guard, and I was recalling some unpleasant stories about The Toad as well.

"Don't play games with me, Fautkenson," he ordered. "I know that one aurumvorax was apparently quite fond of you while you were training at the Academy. From what I have heard about aurumvoraxes, I didn't think they were fond of anything. What do you know?"

I hadn't thought that word of Goldie had gotten beyond the few friends I had sworn to secrecy a few years ago. I decided to lay out the basic facts and hope he would be satisfied with them while I tried to figure out what he was after.

"Well," I recited, "the aurumvorax is a small, shaggy, eight-legged animal usually found around lightly forested hills, though it may be encountered near the timberline of some mountains. Its golden fur is usually long and well cleaned. As you may know, sir, it weighs over 500 pounds in adulthood and fears nothing; the little monster can be extremely vicious and will attack anything that looks edible or threatening." *Much the way you do*, I thought.

Kaor looked unimpressed. "Tell me," he said slowly, "about your pet."

"Ah. My pet. Well, we had one at the Academy that had been captured while it was just about to come full term. It gave birth to six hairless kittens that we separated from the mother. After two weeks, their eyes opened and one took a liking to me. Her fur came out in a golden brown." I was getting nostalgic. "I remember she couldn't seem to get enough to eat, but she and the others took sick. Everything we tried to feed them came back up again."

"Go on," said the Duke. He sounded bored — but his stare was making me more nervous.

"Well, one day I was wearing a gold bracelet that a girlfriend had given me. I picked the kitten up to stroke her, and her nose went straight to the bracelet. She started to chew on it. I thought it harmless enough until I noticed that Goldie was actually chewing the chain to pieces with her little teeth and swallowing the fragments. Before I could get it away from her, she had eaten the whole thing."

Kaor looked less bored now, but continued to stare.

"Goldie perked up immediately afterward and had her health back within a few days. The roots of her hair began to take on a metallic-gold glint. That's when I named her Goldie. I reported this to my mentor, and he suggested that we isolate one kitten on an all-meat diet, give mine meat supplemented with gold, and give the rest of the litter other precious metals with their meals. The kitten with a plain diet died a week later, as did the others, although the one fed platinum lived about three weeks. Goldie grew rapidly, putting on weight until she was too heavy to carry after a month. She retained all the gold

she ate. She gnawed the bars of her cage and any other metal that she could find. Copper pots were a favorite; her teeth and claws absorbed the metal from those.

"By the time she was two months old, I had read everything I could find about aurumvoraxes. I was the local authority on them at the Academy." I puffed out my chest a little. The Duke seemed to be eating it up. Maybe he wouldn't do anything rash to me. "I talked to every ranger and druid who claimed to have seen aurumvoraxes, and pieced together that they are solitary creatures, each defending a territory about 10 miles square. Every eight or nine years, they seek a mate, spend a week together, then return to their respective territories. Sometime between three and four months later, the female gives birth to about half a dozen kittens. She weans them after about five or six years, when they're halfway grown, and forces them to stake out their own territories."

The Duke raised a pudgy hand. "How long did it take yours to reach that point? Was it that long?"

"No," I told him. "Goldie was nearly grown, that's about a yard long and a foot high at the back, in less than a year." I could tell he was ready to ask the obvious question and I beat him to it. "I believe it was because we fed her a diet rich in gold. Any aurumvoraxes in the wild must pick up the gold they need to survive by eating jewelry from unlucky travelers or by actually digging up gold ore itself. The aurumvorax is a burrowing animal with eight sets of claws; no digging task is impossible for it."

The Duke rubbed his chins. "But can there actually be that much gold out there — I mean, in the hills where gold has never been found, but where an aurumvorax is known to live?"

I spread my palms, my confidence back. "Well, where there's an aurumvorax, there *must* be gold. It cannot be otherwise. But the gold will eventually be exhausted, and little will be found in the creature's lair. Dwarves and gnomes are not fond of these beasts, as you might well imagine."

The Duke seemed to consider this for a moment. "What happened to your animal? My sources tell me it was very loyal to you, and eventually you were the only one who could feed it."

My throat went dry for a moment. I dropped my gaze, then words came easily again. "Yes, sir," I said. "She would even let me stroke her, though I had to wear gauntlets in case she was in a playful mood. She could bite my hand off without meaning to do it. But she was gentle. . . ." I hesitated. "I'm afraid she died from poisoning, my lord. She got into a laboratory and chewed on some metal flasks. There was nothing we could do."

"Ah." The Duke sighed, his eyes focusing on the floor in deep thought. "Oh, well."

"If I may, sir," I said after a pause, "why do you have an interest in aurumvoraxes?" Couldn't hurt to ask — I hoped.

Duke Kaor looked up. The candlelight showed he had a faint, fat grin. "As you may or may not be aware, in two months time I am going to the royal court in celebration of 30 years of service to His Majesty. I have been personally invited, and His Highness intends to reward me for my loyalty and devotion. I thought it would be fitting to arrive wearing an aurumvorax cape. For the ego, you know."

I was horrified but didn't show it. Granted that the aurumvorax wasn't an animal you would usually call lovable, but . . . "Where does your lordship mean to find an aurumvorax?" I asked.

He stared at me, then shrugged. "I have been made aware of the existence of one of these creatures near my northern borders. I will personally lead an expedition to dispatch the beast in two weeks, and we will have the cape by the time I leave for the royal audience. Thank you for your time, Faulkenson. My men will show you the way out. Ah — one detail. I'm sure you can appreciate the contents of this room; thus, you may take any item you can spot in the candlelight as your reward." He rose from the chair, and his huge stomach jiggled as he walked toward a side door — probably to the larder. A burly guard reached for my arm.

"Your pardon, gracious sir," I asked hastily, "but how do you intend to kill your aurumvorax?"

He turned and smiled in the dim light. "With poisoned arrows. Why, Faulkenson,

you gave me the idea yourself."

I made a half-bow. "Sir, may I recommend leaving out gold with a coating of poison, then attacking the beast with clubs after it has finished its meal? An aurumvorax's fur is woven so that it resists the penetration of sharp objects, but blunt weapons easily crush its internal organs — and poisons, as I have learned to my sorrow, work swiftly on them."

Kaor the Toad looked astonished, then simply roared and shook with laughter. "Yes! My young man, that's an excellent idea! Superb! A plan worthy of a true mage." He looked around the dim room. "You may take two of whatever you wish." He left through the door, still chuckling.

"Thank you, good sir," I said as the door closed. I had spotted my payment the instant I had walked into the room. Moving behind the Duke's chair, I grasped the pair of objects that rested on the windowsill and placed them awkwardly beneath my cloak. A few minutes later, the guards showed me to a horse the Duke had set aside so I could return to Goodway. I kept up my look of awe and gratitude until I was safely away.

Then I spat to the side as I rode and smiled. "Good hunting, indeed," I whispered, and turned the horse northward.

Years ago, one of my instructors at the Academy had taken a dislike to Goldie and had tried to poison her. He was convinced that poison was the only way to kill her and escape detection; after all, who would

suspect a wizard of not using magic? He was caught, but the poisoning didn't stop; my mentor ordered it continued when he noticed that Goldie was immune to all forms of poison. Nothing slowed her down. Apparently the same internal chemistry that allowed her to use gold also made her immune to any normal toxin.

The Duke would also be in for a surprise when he went to kill that aurumvorax with a club at close quarters. Aurumvoraxes are so dense from the gold they eat that blunt weapons are of little use against them. Using the arrows, with or without poison, would have been a far better idea. A clubbing would only enrage the little beast — and the Duke would have to beg the mercy of the gods to save himself from the monster's fury. The Nine Hells have nothing like them. An old ranger told of an aurumvorax that had chased a mantichore and several wyverns from the hills it had adopted as its home. Another told me of an adolescent green dragon that tried to deprive an aurumvorax of a cave and lost its life.

Was I justified in lying to the Duke, leading him to his death? Aye, the Duke was not the most wicked of men, but his greed was legendary, and you were wise to count your fingers after you dealt with him. When the mood took him, he could be generous, as he had been tonight. He

could also have had me slain. He might still.

As the horse's hooves thundered toward the northern reaches of Kaor's territory, I pulled my two rewards closer beneath my cloak. I would be leaving the area with Duke Radford on the morrow, and wouldn't be back for two months, when my Duke would himself be honored by His Highness for his own service. By then—

The two massive candlesticks beneath my cloak were made from 15 pounds of pure, solid gold each. I laughed. Goldie was going to love them.

Other notes

The aurumvorax sometimes lives near the bottom of a shallow ravine, but usually chooses to dig a burrow or den in the side of a lightly wooded hill. It has eight legs, and is covered with golden fur about 3" long. Measuring 3' long and about 1½" high, the animal has copper-colored teeth and claws, the latter up to 3" long. Its whiskers and parts of its mane are bronze in color, and its eyes are pools of silver with golden pupils. The aurumvorax's flesh is extremely dense due to the intake and retention of gold, which accounts for its partial immunity to attacks by blunt weapons and its incredible weight. Other metals are absorbed into its system as well, but in lesser amounts.

A unique biochemistry grants the aurumvorax a high tolerance to heat and a total immunity to all poisons and gases. They are undamaged by small, normal fires, and magical fires cause only half damage. Likewise, they are surprisingly fast, strong, and tough, being able to drag their own weight in prey. The jaw muscles of the aurumvorax, being especially strong, are used to clamp on to a victim, and only death will loosen the grip.

An aurumvorax typically defends its territory from all other comers, tolerating most other animals but wary of large predators and humans. Almost any animal, however, may be considered prey if it wanders within range. The lair itself often extends deep into solid rock, which can support the beast's incredible weight. Rock rich in gold ore is nearly always used as a lair, though other locations may be chosen so long as gold deposits, either natural or from a civilized area, are available.

Mating occurs roughly every eight years, resulting in a litter of 5-8 kittens, most of which die young because of the rarity of gold. Adults are sometimes forced to eat one or more of their young if gold-based nourishment is not available. Usually, only one or two kittens survive to adulthood. During the first year of life for the kittens, the mother will be bad tempered, attacking anything within sight that might represent a threat to her young. If a PC obtains a kitten before its eyes open, he may attempt to befriend it, the probability of which increases with the amount of food and gold given to the kitten. Without gold in the first three weeks of life, the kitten dies. Kittens can detect any form of gold instinctively and seek it out in addition to red meat. If raised as a pet and supplied with ample amounts of gold, food, and attention, kittens grow rapidly. Typically, an aurumvorax reaches full size in about seven years in the wild, but the time may be only a year in captivity with ideal conditions. Kittens raised in captivity grow into strong, fiercely loyal pets if conditions are ideal.

If killed and eaten, the flesh of the aurumvorax produces severe metal poisoning. The eater must save vs. poison 1d4 turns after the meat is eaten; a successful save means severe nausea and cramps strike the victim (as per a *symbol of pain*), lasting 2-8 hours. Failure to save indicates the victim goes into a coma and dies 10-60 rounds later. Only another aurumvorax may feast on one of its kind. If, on the other hand, the whole animal is roasted and the remains heated until everything burns off, 151-250 lbs. of gold and traces of other metals remain, depending on the size of the aurumvorax. In addition, if the pelt is carefully removed and tanned to preserve not only the hide but the gold-colored, metallic hair (the whole process typically costing 4,000-5,000 gp for the special procedure and materials), a durable but heavy garment may be made that has a value in excess of 15,000 gp.

The Ecology of the Bag of Devouring Hiders Keepers

With an appetite
unmatched by any
other creature,
these tricky beasts
can decimate your
treasure hoard.

H

ow did I become the Keeper? It wasn't my idea at all.

A ghost suggested it.

My story began forty years ago in Colthar, a large port on

the Regal Sea. Like any wealthy city, Colthar was infested with thieves.

So many that some were forced to specialize to survive. I was one of those specialists.

I stole from wizards.

It was dangerous, but work was plentiful and paid well—retrieving knick-knacks from one sorcerer on behalf of another. It was during one such mission that my old career came to an end.

A moonless night found me deep within a certain baron's castle, rummaging through the magician's workshop. Although my pockets were heavy with small items for myself, I hadn't found the scroll I'd been hired to retrieve. I was just about to give up when I discovered something interesting at the bottom of an old battered chest.

It was a threadbare bundle of fabric, smelling of cedar. I opened it and saw it was a bag, one with more room inside than outside. A bag of holding! It was empty, which seemed odd for something so useful, but I didn't quibble. I knew a fence who would pay well for it.

The sound of a key in the door interrupted my thoughts. Unless I acted swiftly, I was caught! There were no windows and only the one door, so running was out of the question. Worse, the room was tiny, without even a closet to conceal me. There was only one place to hide.

I opened the bag and leaped in until just my head and arms were sticking out. It's weird, I tell you, to reach down to where your legs should be but find nothing! Shutting the chest from the inside, I heard the door creak open and a man shriek for the guards. I sealed the bag's opening, disappearing from view.

As long as no one opened the chest and looked inside the bag, I was safe. When a search of the keep found nothing, the guards would assume their burglar had escaped. They'd drop their guard, and I could sneak out the next morning disguised as a workman.

I simply had to wait.

It was a tight squeeze, so I had to crouch to fit.¹ It was pitch black, but the walls felt like leather and gave slightly when I poked with my finger. The air smelled old and dusty, like an abandoned attic. After a while I began counting my breaths.

At a thousand no one had come after me. The air was stuffy, and I wanted some ventilation. I reached up and couldn't find the opening! I searched everywhere, running my hands over every bit of the interior, trying not to

1. Per the *DUNGEON MASTER*® Guide, a bag of devouring can hold 30 cubic feet. This capacity requires a

cylindrical area 32 inches in diameter and 5 feet deep.

by
Kevin N. Haw

illustrated by
Corey Macourek

panic. Perhaps the guards knew where I was hiding and had tied the bag shut to suffocate me!

I was desperate, not thinking straight, when I decided to cut myself out. Stupidest thing you can do of course, cutting into something "extradimensional," as the wizards say. No room for my short sword, so I drew my dagger and began to slice into the roof of my little prison.² I figured things couldn't get any worse.

Of course, I was wrong. The walls started to ... well, ripple, for want of a better word. I pulled back to stab harder when a hole opened up beneath my feet and the stench hit.

It reeked of rotting garbage and mildew, but over everything was a burning, metallic tang as though someone had tossed all the chemicals in an alchemist's shop onto a carrion heap! It was awful, but it was nothing compared to the agony when the chamber began flooding with acid.³

I dropped my dagger and scrambled upward, clawing my way clear. My burned feet were safe for a moment, but the acid was rising.

How I remembered it is a mystery, but one of the items in my pocket from the wizard's den was a ring of acid resistance.⁴ I slipped it on, and it grew warm and hummed faintly. My feet were in agony, and my boots burned to tatters, but when the acid finally engulfed me I felt only a tingling sensation, not the hideous pain I had expected.

Even if the stuff didn't burn, it could drown me. I probed with my foot and found that the drainhole had opened into a tunnel, and it was wide enough for me to slip through. My only option was pretty obvious.

Filling my lungs with all the stale air they could hold, I dove down the tunnel

feet first. The going wasn't easy, though! The fluid was thick, closer to stew than water. Lots of spongy, half-rotten pieces of ... things I'd rather not talk about.

After maybe five yards, the tunnel curved sideways.⁵ I swam on my back, my spine scrapping through something that felt like gravel. When the tunnel opened into some kind of pool, my lungs were bursting. I broke the surface and gasped some putrid but breathable air.

I swam blindly into something that felt like an island of garbage. It crunched as I crawled out of the acid, gasped for breath, and flopped onto my back. I stared into the darkness overhead, stunned by how fast it had all happened. The whole thing, from the first whiff of acid to my lying on that island, had taken maybe twenty heartbeats.⁶

Inside my pouch was a tinderbox and small candle, which yielded a dim flame when lit. I peered into the shadows and found myself in a round cavern, maybe thirty paces wide. My little island was indeed a mound of rotting garbage, shattered bones, and pieces of driftwood. It was five paces wide and in the center of the acid pool. The ceiling was maybe three times my height, so I could stand up if I didn't mind sinking shin deep into the filth.

There were no other entries or exits, no marks on the strangely ridged walls and ceiling, no sign that any living being had ever been there. The cavern was desolate and empty except for the acid pool and the little island. It was absolutely the last place you'd expect to be greeted by a cheerful, grandfatherly voice.

"Why, hullo there!" called the voice from behind. I whirled, sword drawn for whatever I faced. No one was in sight.

"Who is that?!" I shouted. "Show yourself!"

"Well," the voice chuckled. "I'm afraid that's not possible, old boy."

By this time I was spinning like mad, desperately seeking the voice's source. After a moment, I realized that it came from everywhere at once and also from nowhere in particular. I'd seen enough strangeness while thieving from mages to know what that meant.

"Ah," I asked, weapon still drawn. "You are a ghost, right?"

"Well, I believe so," answered the voice. Then, in a musing tone, "Technically, I might be an apparition or a spectre. Never could keep them straight. What do they call the harmless ones?"

"Er, a poltergeist?"

"Don't think so. They can't talk. Probably can't think, either. Just bang on windowsills and knock over bottles."

"You've got a point there."

A long, almost embarrassing silence followed.

I finally said, "You don't act like a ghost."

"I suppose not. But, it's not like I received any instruction. After I was

2. The interior of a *bag of devouring* is AC 7 and can withstand 15+1d6 points of damage before ripping. If ripped, the *bag* is destroyed, forming a 10-foot-wide vortex to the Astral plane, just as if a *portable hole* were placed within a *bag of holding*. Anyone inside the *bag of devouring* receives no saving throw against the vortex, while those outside can make a Dexterity check to jump clear. Except for destroying the *bag* and sealing one of its "mouths," the devourer is unharmed.

If the damage inflicted does not rip the *bag*, then the character trapped within is subject to immediate acid attack (below).

3. A devourer launches an acid attack if any damage is inflicted from inside the *bag*. Every round, the

acid causes 1 point of damage for every Hit Die of the devourer, although a successful saving throw vs. poison reduces the damage by half. See below for determining a devourer's Hit Dice.

4. A *ring of acid resistance* protects from all forms of normal acid, up to 30 points of damage per round. The wearer gains a +2 bonus to saving throws vs. additional damage. The *ring* works continuously when worn and radiates faint magic. The *ring* has a resale value of 5,000 gp and is worth 2,500 XP.

5. This is the "throat" of the creature, linking mouth and stomach. It is AC 7 and withstands 15+2d6 hit points before ripping. Anyone being swallowed attacks at a -5 penalty and cannot resist being pulled further into the beast. (See below.) If

ripped, a vortex forms just as with a ripped *bag* and no one in the throat or *bag* receives a saving throw. The devourer suffers no ill effects except the loss of the *bag*.

6. A trip from a *bag of devouring* to a devourer's stomach takes 4 rounds if the object (or victim) isn't resisting. Characters actively making their way to the stomach ("going with the flow") take 3 rounds if their movement is below 6 and 2 rounds if it's 6 or more. A character can resist being pulled closer to the stomach every round as they would resist being swallowed in the first place (75% base chance of failure minus 5% per Strength bonus). Resistance isn't recommended because every round spent reaching the stomach subjects the victim to an acid attack.

dragged in, there was just pain and blackness. Then, poof, I'm a ghost."

"Dragged in? Into what?"

"Why, into the beast, of course. Through a bag of devouring."

When he said that, my heart went cold. I felt my limbs weaken, and the sword slipped from my hands.

It all made sense, then. Why something as useful as a bag of holding would be left in the wizard's chest, empty and neglected. Why it had closed up, sealing me in. The terrifying, bizarre journey through the acid. It all fit with the stories about bags of devouring—that they are simply camouflaged mouths for some extradimensional monster, a devourer that eats everything placed inside.

And I was inside the thing's gullet, waiting to be digested.

"Are you all right?" the ghost asked, concern in its voice. "Surely, this isn't a surprise to you."

"You have no idea how surprised," I laughed, trying to keep my rising hysteria out of my voice. "I thought it was a bag of holding."

"Oh, my! Since you were protected from the acid, I thought you were an explorer. A scholar or biologist like myself, perhaps. I'd hoped that you had come here to complete my work."

"Huh?"

"My name is Philby, Josiah Rufus Philby of the Naturalist Guild of Elfmist City. I am, or rather was, the foremost expert on the bag of devouring."

"If you were such an expert, how did you ... well..."

"Get eaten? A laboratory accident. My own fault, really. I'd just had a horrible argument with my guildmaster, you see. He had the nerve to call my research worthless, said there was no practical application for it! I was upset and distracted, and I forgot to take the proper safety precautions before resuming work with one of my bags of devouring."

"And it pulled you in?"

"In a heartbeat. I've been haunting this place ever since then. I hear that's what happens when you die with unfinished business left."

"Philby, since you know so much about devourers, can you help me get out of here?"

"Hmmm ... an interesting challenge. It would be difficult..." he faded off. I could picture him rubbing his nonexistent chin in thought. "I'll give it a try, though."

"That's great! Let's get—"

"And, in return, you must do me a favor."

"What?" I sputtered. "You're a ghost, Philby! What can I possibly do for you?"

"We'll settle that later. For now, you must do some exploring."

I paused to put some herbal salve from my kit on my feet, then shredded my cloak to make wrappings to replace my boots. I checked to see the ring was still working and waded into the muck, my pitiful candle held high.⁷

Philby directed me toward the walls, and I discovered that they were indeed living flesh. The color varied from a dull pink to a light gray. There were twenty little alcoves in the wall, scattered around the chamber's perimeter. Philby informed me that each alcove had a flap beneath the acid to control access to the stomach. Each of those in turn led to a tunnel and thence to another bag of devouring. No wonder the stomach was so big—the creature had twenty mouths!⁸

"Philby, do you think I can cut through a flap?"

"Not likely. There's three feet of muscle protecting that exit.⁹ Unless you have a blade more impressive than that little pig sticker, it'd take days. Try to find another flap weakened by disease or birth defect."

I checked every alcove, but none proved any weaker than the first. Philby decided we needed another approach.

"You said you were, how shall I put it, 'involved with the underworld' back home?"

"Yes, I'm a burglar," I replied, defensively. "In Colthar, it's considered an honorable trade—"

"I'm sure it is," Philby interrupted. "Can you climb that wall?"

"Why?"

"Well, you see, devourers start out as an embryo with a single, nonmagical mouth. Only later do they grow bags of devouring on other planes."

"And how will that get me home?"

"The nonmagical mouth grows shut, but it forms a weak spot. I've examined it on this specimen, and it's thinner than the mouth flaps, but it's in a very precarious place."¹⁰

"Where?"

"In the ceiling, directly above you."

So, it was back into that muck to study the walls. They were covered with a thick, clear film,¹¹ so at first I thought they were unclimbable. But when I looked closely I saw the wall's texture was similar to the ridges on the roof of my mouth, but much bigger. The entire surface was a network of handholds.

Even with that, it was a hard climb.¹² It would have been easier with climbing spikes, but I had none. I was halfway up the wall panting for breath when I reached for a long horizontal wrinkle to use as a handhold. Suddenly, it opened to reveal an eight inch wide eye staring right at me! The pupil was slitted like a cat's, but the whole surface was milky, like an animal with horrible cataracts. It scared me down to my toenails! I lost my grip and fell backward into the pool.

I came to the surface sputtering. In the candlelight from the island, I saw the eyelid close, apparently content that I was causing no more trouble.

"Philby! What was that!"

"Just an eye, nothing to worry about. There's one above each alcove."

"You mean it's watching me?!"

7. A devourer's stomach acid is approximately 5 feet deep. A character can wade or swim through this fluid at 50% normal movement rate.

8. A devourer has 3d20 bags of devouring serving as mouths. Each mouth corresponds to five years of age and 1 Hit Die.

9. A character attacking one of these flaps must inflict one-third the creature's total hit points to get through. (Note that devourers are immune to all poi-

sons and acids.) Like the inside of a *bag of devouring*, a devourer's stomach is AC 7. Upon causing more than 10 points of damage, however, the attacker and anyone else in the stomach are subject to expulsion from the stomach. (See below.)

10. This residual mouth flap is treated as any mouth flap, except that it takes only one-quarter of the creature's hit points to penetrate. If a melee weapon is used, the DM might require extra Climbing

proficiency checks to reach it.

11. This film is similar to the lining of an animal's stomach, protecting flesh from digestive acid. It has strong acid resistant properties and can be used as an ingredient in acid resistant magical items.

12. Such a climb imposes a -30% penalty on a Climbing check. Driving spikes into the wall or using other climbing equipment has a 50% chance of causing expulsion from the stomach. (See below.)

"Well, yes. All its senses face inward, toward its next meal. Hardly smarter than a dog, in fact. This one isn't sentient, you see."¹³

"This one?"

"Of course. Some devourers react oddly to strong, continued doses of magical energy. They begin—"

"Forget it," I interrupted. "I don't want to know."

"You probably don't. Why don't you rest, and I'll try to think of another way out."

I sighed heavily, shaking my head.

When I'd fallen, I'd scraped my elbow on the bottom of the pool. I cleaned the wound and noticed something glinting. Pulling it out, I found a tiny nugget of copper, heavily pitted but very shiny.

I felt something stirring deep inside

my heart, a basic element of my nature that had been sorely neglected for hours: my greed.

"Philby," I asked, my mouth going dry in anticipation. "What's at the bottom of the acid pool?"

"Oh, that stuff. Bits of slowly digested material. You see, when people lose something in a bag of devouring, some substances take longer than others to digest. Flesh, leather, and parchment dissolve almost immediately. Wood and bone last a little longer. Metals and gems take months to break down."¹⁴ Even magical items eventually succumb. And since people often mistake bags of devouring for bags of holding—"

"Any treasure they toss in winds up at the bottom of the pool," I completed. "And there would always be a steady

supply, too! I mean, nobody keeps a bag of devouring once they know what it is. They either trick an enemy into taking it or throw it away for someone else to find. There'd never be a shortage of fools tossing stuff into a devourer's gullet!"

"Well, yes. That's part of its survival strategy," Philby replied. "And just why are you so excited?"

I ignored him and instead dove under the surface. I surfaced with a handful of gold nuggets! Some time later five pounds of gold and silver flakes rested in my knapsack. My pouch held a handful of diamonds and rubies the size of rice grains.¹⁵ My candle was sputtering, though, so I decided to continue looking for an escape.

"Are you finished?" asked the ghost, his voice dripping sarcasm.

13. At the DM's discretion, any devourer with ten or more mouths might have mutated by magical energy to have an Intelligence score of 4. Such a devourer watches characters through its eyes and communicates via telepathy. Because the devourer rarely interacts with other creatures (except to eat them) and knows nothing of the world outside, its personality resembles that of a petulant child ("You not screaming in pain like other food. I make you

scream now."). While one might be convinced via mind control magic or trickery to help, the end result will more likely be acid attacks or expulsion from the stomach.

14. Obviously, goods swallowed by a bag of devouring are not spit out into extradimensional space. Instead, they must make saving throws against acid upon initial contact and once per day thereafter until they dissolve. Ceramics and glass,

however, automatically make their saving throws.

15. The stomach of a devourer with ten or more mouths holds treasure equivalent to treasure type A except that no platinum or art objects are found intact, and gems are never more valuable than 50 gp. For every extra fifteen mouths, roll again for treasure. (So a DM would roll twice for a twenty-five mouth devourer and three times for a forty mouth monster).

"For now, yes."

"Fine. When you were diving, did you find any ceramic or glass?"

"Yeah. There's some shards of porcelain in my pack."

"Look closely at the edges of one. Are they smooth or pitted like the metal nuggets?"

"That's strange. No pitting at all."

"Wonderful!" he laughed, like a child with a new toy. "It's indigestible!"

"And...?"

"And that means there are things a devourer can't digest. Therefore, it has to get rid of it somehow, which means there's another exit!"

"Isn't there another way?" I replied, disgust in my voice.

There wasn't. Philby told me to dig through the rubble in the island. Soon, the rubbish gave way to sludge that looked like red clay mud.¹⁶ Further, there were ebony spheres the size of my hand. They felt like glass, and my short sword couldn't scratch them.¹⁷

"Take some of those," Philby ordered. "They're for the favor I'm going to ask later."

"Are they gems?"

"No. Much more valuable."

He didn't have to tell me twice. I shoved several in my knapsack and kept digging. Finally, I reached some of the creature's flesh.

"Philby, you're sure about this?"

"Yes. Go ahead."

Following Philby's directions, I took a deep breath and slammed my short sword into the devourer with both hands! The reaction was as he'd expected, and the beast rippled in pain.¹⁸ If my earlier cut had caused a tremor, this was the grandfather of all earthquakes! A hole opened, and the island,

the acid pool, and I were all dragged down into the darkness.

I managed to keep hold of the sword as I was pushed along another tunnel and then suddenly out into open water. I swam up toward sunlight, then surfaced and gasped for breath, treading water on an enormous ocean. I coughed, choking on salt water.

"Curse you, Philby! You didn't say anything about an ocean!"

There was no response, but I thought I heard a faint chuckle.

From the outside, the devourer was an island the size of a small mansion. It looked like the side of a whale, just black blubber and barnacles. I circled and saw nothing but that mound of flesh. No eyes. No fins. When my legs tired, I cautiously climbed aboard.

I lived on that thing's back for three days and saw no other creature except the devourer, the barnacles, and myself.¹⁹ The ocean was barren and incredibly salty. Philby said that only a few species of fish and some specialized seaweed could survive in that brine—nothing that could sustain something as big as the devourer. He felt that was why the beasts originally began getting food from other dimensions. Somehow, the sea had died, and the devourers were forced to look elsewhere for nourishment. They're like sea anemones, casting their tentacles as wide as possible for food. Instead of tentacles, though, their bags of devouring capture prey on dozens of other planes.

I, however, was not that fortunate. I tried fishing but never got a bite. Instead, I survived on blubber sliced from the beast's back. The stuff tasted horrible, but I appreciated the irony of my diet.

Philby and I passed the time talking. I talked of life in Colthar while he spoke about the devourer. He didn't speak much of his "mortal days," as he called the time before his death, and I gather that there wasn't much to tell. Philby had lived only for his studies. Now he used his ability to pass through solid objects to study the devourer literally from the inside out.

As content as he was, though, Philby admitted he longed for rest. It wasn't a surprise. He'd spent nearly a century as a ghost.

I never saw a coastline, only the endless ocean. Philby hadn't either but said devourers drifted by on occasion. The infants are the size of a rowboat, and the ancient ones are as big as a city block. He told me that a few of the big ones had villages on their backs.²⁰

He didn't say much about the villagers, except that they were cannibals and that he scared them off whenever they brought a canoe near "his" devourer. He guessed that the disaster that had killed the oceans also destroyed the dry land, forcing their ancestors to sea. When I asked Philby how he knew they were cannibals, he refused to answer. I didn't press the issue but decided that anyone who could scare a ghost was best avoided.²¹

On the fourth morning, in the distance, Philby spotted my way home.

"Where is it?" I asked, straining my eyes on the horizon.

"Toward your left. Do you think you can make it?"

"Colthar is a port city. I learned to swim before I could walk. It's far, but I'll make it."

"You remember what I told you to do? I'm counting on you."

16. This nutrient solution can be synthesized by a sage skilled in alchemy, requiring a successful "specific task" if a sample of the solution is provided or an "exacting task" if only an egg is provided for study (although the egg will not be damaged by this). A full 200 gallons of the nutrient solution is required to hatch and grow an egg into an infant devourer at a cost of 5 gp per gallon.

17. At any given time, a devourer is gestating as many eggs in its stomach as it has mouths. Every egg immersed in the nutrient "mud" from a devourer for three months has a 10% chance of hatching into a larva. These larvae must be kept in the solution for six more months, during which time they ingest all unhatched eggs using the "residual" mouth mentioned earlier. At the end of this time, the larvae's first bag of devouring becomes functional and the devourer can feed itself. It is expelled from the parent, and the residual mouth seals itself.

18. An attack on the interior of the stomach makes the devourer convulse in pain. All characters are forced through the rest of the digestive track and subjected to 5 rounds of acid attacks. Afterward, they are free of the creature and find themselves on the devourers' home plane.

19. There is a 99% chance that an encountered devourer lives on its home plane and a 1% chance of its being "cultivated," as in the Keeper's tale.

20. If a devourer has thirty or more bags of devouring, the DM should roll percentile dice. On a roll of 1-40, the beast has a humanoid village on its back. Structures made of bone and driftwood provide some shelter from the sun, but not much. A village will have 4d10 humans (1-2 on a 1d6 roll), orcs (3 on the roll), goblins (4), or elves (5-6). All fight as 2nd-level fighters, although each tribe has a chief who fights at 5th level. Such skills are required for a cannibal to survive to adulthood.

On a percentile roll of 41-70, the DM should set up a "special" encounter instead of a village. Good examples would be a few low-level undead, a lone troll or ogre, or a mated pair of griffins. The DM should explain how the creatures survive (undead don't need food, the ogre can swim from the shore, while the griffins raid passing villages, and so on).

Percentile rolls of 71-100 indicate nothing living on the devourer's back.

21. The villagers are indeed cannibals, having no other sources of food except devourer flesh, seaweed, and (rarely) one of the few fish that live in the briny sea. They immediately attack any other creatures they see, eager to improve their diet. They are armed with spears and clubs, and (when possible) fight to subdue their foes for feasting rather than killing them immediately. If a captive is taken alive, the cannibals usually take several days to finish him off, as they lack any way to store leftovers.

There was a hint of worry in Philby's voice. As a ghost, he was bound to the devourer and couldn't go farther than a stone's throw from the beast.

I stripped down to my breeches, said my farewell, and dove into the sea with my sword and pack lashed to my back. Took an entire morning to get there. Swim and rest. Swim and rest. At least it was easy to float in that brine. After about four miles I reached my destination, sunburned and exhausted.

It was a baby devourer, no larger than a hay wagon. Its skin was thinner than that of the older beast, and I hacked my way in.²² It covered me with ichor, but I was wearing the ring and finally reached its stomach. Fatally wounded, the creature started to sink.²³ It only had two throats, unlike the twenty of my previous host. I picked one and sawed through the thin muscle flap. I crawled through, followed by a flood of seawater, emerging from a bag of devouring into the bedroom of a very surprised merchant in the glassblowers' quarter ...²⁴

...

"Sir?"

The old man started, realizing that he'd trailed off as he told his tale, lost in forty years of memories.

"What?"

"Regrets, sir," repeated the apprentice. "I asked whether you have any regrets."

"About becoming an honest man?" laughed the Keeper. "Not a one. If I hadn't botched that burglary and gotten myself swallowed, I'd never have become the Keeper. I wouldn't have met my beloved Melissa, had children, grandchildren.

"No, lad, I'm glad I came to this plane, even knowing that I'd never find my way home, and I'm glad I met Philby. Why, he made me rich! I think he was right, that my work here proved his studies had a practical use, proved that miserable guildmaster wrong. I only hope that was his 'unfinished business' and that his spirit found peace."

The Keeper sighed, staring out at the bustle of activity below. His bookkeeper sat at a table in the midday sun, counting out a pile of coins and entering the sums in a ledger. Workmen hauled a wheelbarrow of silver ingots down the pier, the planks creaking under the weight. Apprentices in protective suits climbed through the hatch grafted into the side of

an adult devourer, moored to the pier like a derelict ship. And watching over everything were his guards, protecting not only the treasure but also his three beloved devourers.

"But, most of all," said the Keeper of the Devourers, imparting a final thought on his apprentice, "I'm glad I listened to Philby so long ago and brought those devourer eggs back with me when I escaped that creature."

Kevin Haw lives in Southern California with his wife. They have two bags of devouring—a terrier and a pointer.

22. The exterior of a devourer is AC 5. The creature has no exterior attacks, but anyone hacking their way into the beast (by causing enough damage to kill it) is subject to acid attacks.

23. The extradimensional links between a devourer and its bags of devouring last 1d10 rounds after the creature's death. After this time, the bags fail and dissolve into dust.

24. Realistically, the odds that a particular bag of devouring is connect to a given plane are miniscule. However, a merciful DM might decide that a bag connects to the PCs' home plane.

BARGHEST

Looks like a goblin.

Kills like a fiend.

By Nicolas Logue
Art by John Carimando

A grey shadow darts from tree to tree, and low snarls echo softly through the snow-laden forest. No tracks mar the white shroud of freshly fallen snow, but fiery eyes burn in the misty woods: Barghests. Vicious fiends in the guise of worgs, their appearance spells doom to onlookers.

These wolfish monsters run through glades leaving no trail for the ranger to track. By taking the form of simple goblins, these sinister shapechangers mask their darker nature and prey on the unwary. They appear by magic, terrorize their foes, and then gorge themselves on flesh ripe with the taste of fear. Once both flesh and souls are devoured, the barghests vanish into the night.

With every victim they devour, their infernal power grows.

Myths and Origins

In a time before men immortalized their deeds with written word, when the shape of the planes were less well defined, the first barghests came into existence. Great goblin kings of old served abominations of Gehenna with more than just their swords and strength; they also mixed their blood with worg pack-lords, creating the potent bond between the two species.

These mixed-blood outsiders were the first barghests, great overmasters of the goblin and worg races who cut a swath of carnage and terror across the planes. Their hunger could not be slaked, and entire races were erased from existence, devoured in their entirety by great packs of demon-dogs and leaving behind nothing but stones.

Many of Gehenna's native species were culled, and the barghests' gluttony brought them victory after victory. Planar travelers returned with tales of vast realms, emptied of all inhabit-

ants, whose entire civilizations fed the barghest overlords of old. The carnage the barghests wrought was well known among demons, angels, and the great races of the multiverse, and the sight of a barghest became synonymous with desolation and death. Even to this day, they remain a horrific portent of doom to all unfortunate enough to meet one.

Their ravenous appetite was their undoing. With nothing left to eat, the great barghest packs turned on one another. The barghests devoured enemies, allies and kin alike in a brutal civil war, a time called the Bitter Feast.

Many packs fled the planes, and others were forced to make alliances with other powerful entities and organizations to survive. These barghests made dark compacts, binding themselves to other powers to avoid enslavement at the hands of devil princes and demon lords. Some even swore service to powerful mortal warlocks and wizards among House Stross, or to the undead

princes of Morgau.

During this hungry war of attrition, their goblin and worg minions fled their masters' sides, most ending up in the Prime Material Plane. Many goblin clans still worship their "dark ancestors." Most goblin tribes and worg packs pay homage to patron spirits in the form of their ancient kings – the first barghests, including Tordaccan the Vile and Mistrokesh, the Ravening King.

For this reason, few goblinoids and worgs can resist the call of a barghest, and often bow down in servitude to these fiends when they appear. Fewer in number now, most of the remaining unbound barghests hide from their many enemies. Rather than lording it over the planes, they appear only rarely to herald death and feast on souls.

Physiology

Barghests are shapechangers able to assume two forms: that of a larger specimen of goblin, or a wolf with a feral humanoid visage. These two guises allow a barghest to infiltrate groups of either wolves or goblins, catching the party off guard and unprepared to face so formidable a foe. A few telling differences can save a group of heroes' lives. In goblinoid form, barghests have a stronger build than mundane goblins, and a distinct shade of skin. Young barghests in humanoid form have the greenish skin of their goblin relations, but as they age, their skin darkens to a deep blue.

In wolf form, barghests resemble wolves physically. However, they are much more aggressive, and they retain vaguely humanoid faces. In either form, the creature's eyes glow with a hellish red fire, especially when they are excited at the prospect of a kill.

A greater barghest is easy to distinguish from its brethren. In humanoid form the greater barghests are much larger than any goblin, standing around eight feet tall. They often weigh over 500 pounds, and run to fat.

While young, barghests stay in their hybrid, goblin form most of the time. Whelps in this form appear no different from a common goblin; wolfish features

appear only after the age of 10, when young goblins go on their first raids.

A fiendish patron or pack leader often leaves a young barghest with a community of goblins to foster the child. A barghest typically does this by stealth. To make room, the fiend devours a young goblin and leaves its own pup to be raised by the goblin family; goblin mothers are either enchanted or intimidated into accepting the child as their own. T

The whelp grows normally until around age 10 or 11, when it develops into a hideous monstrosity with the body of a wolf, a goblin-like face and long cruel-taloned hands growing from its forelimbs. At this time the whelp discovers its infernal abilities, and rarely hesitates to devour its foster guardians. The young barghest's hunger also grows unnatural at this age; it can eat without pause for hours or even days.

Barghests are eating machines. Their fiendish anatomy is suited to their ravenous appetites, and it allows them to devour foes in their entirety. To do so, the jaws of a barghest open wider than any wolf's, to reveal a gaping maw is filled with row after row of razored

teeth. These triangular fangs are perfect for flensing muscle and crunching bones. With its unhinged jaw, a barghest can consume a humanoid victim in a matter of seconds (typically, 1 full round action is all that is required).

A barghest absorbs the essence of its devoured foe, fueling itself with the souls of their victims. Particularly potent barghests absorb their prey's souls into their own, trapping their spirit for all eternity, unless the barghest who consumed them is slain. The sight of a barghest feeding is disturbing, both in its speed and its intensity. Even seasoned veterans have been known to flee in terror at the grisly sight, and the bone-gnashing cacophony, of a barghest devouring human prey.

If forced to flee from barghests or even goblins, wise adventurers do not leave any wounded or fallen comrades behind. They will be devoured, making it difficult to return them to life. In the case of a barghest this happens quickly, but goblins following barghest custom often consume foes as well, as a tradition with roots in barghest feasting.

In either case, a comrade's body is completely consumed. *Raise dead* spells

Knowledge of the Barghest

Characters with ranks in Knowledge (the Planes) can learn more about the barghest. When a character makes a successful skill check, reveal the following lore, including the information from lower DCs.

DC	Result
10	Barghests are evil wolfish creatures whose appearance is said to bring death or ill luck.
15	Barghests are shapechangers who can assume either goblin or wolf form. They live on a distant plane of war.
20	Barghests have powerful spell-like abilities, and the greater barghests are much more powerful than lesser barghests. Both are difficult to harm without magical weapons. The PC can also identify a barghest in natural wolf-goblin form, though not in goblin form.
25	Barghests grow in power by consuming the bodies of their foes; lesser barghests may become greater barghests this way. Barghests can <i>pass without trace</i> , and are often sent to the Material Plane in hunting packs to hunt victims and gain power. These victims must be weaker (less HD) than the barghest.
30	The PC is familiar with all the specific spell-like abilities of barghests and greater barghests and can distinguish a barghest from a goblin or wolf even at maximum Spot range.

will not restore them and their fellow adventurers are forced to *resurrect* them. When faced with a barghest with the Soul Feed feat, even this is impossible.

Psychology and Society

Barghest society is hierarchal and organized into packs. This stratification stemmed the feeding frenzy that culled so many of them during the Bitter Feast. Pack lords oversee every barghest pack; these are greater barghests of extreme power who require utter subservience from they lead. Pack lords rule through fear and are watchful of their charges. They make examples of agitators by devouring them in full view of the others.

A barghest's only means of advancement is to kill and consume its superior. These cruel monsters have no sense of family, loyalty, or compassion. Barghests do not hesitate to devour their own young if they feel the children are a threat to their power.

The greatest rite of passage for young barghests is the transformation to greater barghest. Elders place several whelps into loose hunting parties and send them to the Material Plane to engage in the Great Hunt. One or more of the pups will consume enough victims to make the transition to greater barghest. The strongest or most cunning barghest proves itself and dominates the group. Its commanding position becomes permanent when it becomes a greater barghest. It then forces the rest of the barghests to do its hunting and bring suitable victims for it to consume.

Lazy by nature, barghests retain minions to serve their needs. They make good use of their *charm monster* ability to secure human, goblin, or even ogre servants who can find meals for them or investigate an area's power structure without attracting undue attention.

Barghests on the Material Plane are known to subjugate entire tribes or even nations of goblins to serve them, claiming to be deities or powerful heroes of legend in order to gain their loyalty. If this fails, the barghest simply devours the tribal elders and assumes control. Whether through force or guile, once

the barghest has control of a tribe it uses its goblin pawns as fodder, forcing them to track down and waylay individuals powerful enough for the fiend to feed off. Barghests are often responsible for unexplained disappearances. When adventurers investigate a rash of bizarre kidnappings and goblinoids are involved, they should be wary of possible barghest activity.

Barghests hiding among goblins or worgs sacrifice many of their minions simply to lure a party of adventurers into a false sense of security. Once the heroes are certain they are facing a pathetic rabble of goblins and worgs, the fiends pounce. The barghests often use *invisibility* to observe the fray, and when the party is sufficiently weakened by their minions' onslaught, the slaving fiends close in for the kill.

Barghest Feats

Soul Feed [Monster]

By devouring a foe, you absorb their very soul into your being, feeding off their spirit as well as their flesh.

Prerequisites: Greater Barghest, gained at least 3 HD through feeding.

Benefit: When you feed on an opponent, their soul is trapped in your own spirit, and the victim cannot be *resurrected* unless you are first slain. If the victim's hit dice are equal to or greater than your own, you immediately gain a *death knell* spell-like ability. These benefits are in addition to the normal results of the Feed ability.

Portent of Doom [Monster]

The sight of you speeds onlookers towards their doom.

Prerequisites: Greater Barghest or 10 ranks in Intimidate.

Benefit: Anyone who beholds you must immediately make a Will save (DC equal to 10 plus ½ your hit dice plus Charisma modifier). If they succeed, they are immune to this power for 1 day. If they fail, they immediately feel death's claws tearing their soul from their body, becoming shaken for 1 round. In addition, the next time they make a saving throw vs. a death effect,

they must roll twice and take the lower of the two results.

Harbinger of Death [Monster]

The blood of your ancestors flows strong in you. Where you lead death follows, and you terrorize foes.

Prerequisites: Greater Barghest, Portent of Doom, 20 Cha, must have advanced 5 HD by feeding.

Benefit: You add the following spell-like abilities to your list:

At will—*deathwatch*, *doom*.

1/day—*death ward*, *nightmare*, *slay living*.

Howl of the Worg King [Monster]

Your fearsome howl inspires fear in foes and calls worgs to your defense.

Prerequisite: Barghest.

Benefit: While in wolf-like form, as a standard action, you may raise your head high and howl fiercely into the night. Any foe within 60 feet must immediately make a Will save (DC equals 10 plus half your Hit Dice plus your Charisma modifier) or become shaken for 1d4 rounds.

All worgs within 1 mile hear this call and must make the same Will save or travel to your side by the fastest possible route to defend you against your enemies. Worg allies who hear the howl gain +2 to attack, damage, and saving throws until the encounter ends.

History of the Barghest

The myth of the barghest originated in England, most notably in Yorkshire, though legends of black dogs of death, and spectral hounds exist in several cultures the world over. The word's origin may be derivative of north England's pronunciation of the word ghost as *guest*, naming this ghostly black dog as a *burg-guest* (town ghost). It may also sprout from the German *berg-geist* (mountain ghost) or *Bar-geist* (bear ghost) in allusion to its alleged appearance as a bear.

Britain is rife with these death dealing fiendish goblin-dogs, and the barghest of York is joined by the Demon of Tedworth, the Black Dog of Winchester, the Lancashire Striker, and the Padfoot of Wakefield. In each case this large, usually black, wolf or dog with huge fangs and claws is a reputed omen of death and ill luck.

In Jersey folklore, the Black Dog of Death is a phantom whose appearance presages storms. Smugglers may have spread the story to discourage people from leaving their homes at night and witnessing illegal transport of contraband.

The barghest makes an appearance in several works of literature, most notably in Sir Arthur Conan Doyle's most famous Sherlock Holmes story, *The Hound of the Baskervilles*, the supposed phantom dog of which is no doubt inspired by barghest tales. The "Grim" of *Harry Potter and the Prisoner of Azkaban*, is a nod at England's classic ominous ghost-dog tale. Sirius Black transforms into a black dog and is named for one; his nickname just happens to be Padfoot (of Wakefield perhaps?).

Greater Barghest: Vralgor Szarn

Vralgor rose to power by ambushing and consuming a powerful priest and his paladin guards during a Great Hunt. Vralgor moved the hunting party into the sewers below the Free City of Zobeck. Now Vralgor and his lessers feed on the city folk at their leisure.

The greater barghest curtails any threat to his position as pack leader by devouring lesser barghests. Vralgor has *charmed* the guildsmaster of a small rogue's guild, and he uses the rogues as his private spy network. With plenty of victims delivered to his waiting maw, Vralgor grown too huge to leave the sewer tunnels without using his *dimension door* ability. His *ring of x-ray vision* helps him keep tabs on the streets above.

VRALGOR SZARN CR 10

Male advanced greater barghest rogue 2

CE Medium humanoid (shapechanger)

Init +4; **Senses** darkvision 60 ft., scent, Listen +27, Spot +27

Languages Abyssal, Common, Giant, Goblin, Infernal, Worg

AC 23, touch 9, flat-footed 21

hp 205 (17 HD); **DR** 5/magic, evasion

Fort +16, **Ref** +14, **Will** +16

Spd 40 ft.

Melee +27 large adamantite greatsword (3d6+20/19-20) and +23 bite (2d6+4), or +25 bite (2d6+9) and 2 claws +23 (1d8+4)

Base Atk +16; **Grp** +29

Atk Options feed, Harbinger of Death, Improved Sunder, Portent of Doom (DC 26), Power Attack, sneak attack +1d6, Soul Feed

Spell-Like Abilities (CL 17):

At will—*blink*, *deathwatch*, *doom* (DC 19), *invisibility sphere*, *levitate*, *misdirection* (DC 20), *rage* (DC 21)

1/day—*charm monster* (DC 22), *crushing despair* (DC 22), *death ward*, *dimension door*, *mass bull's strength*, *mass enlarge*, *nightmare* (DC 23), *slay living* (DC 23)

Abilities Str 29, Dex 14, Con 24, Int 22, Wis 24, Cha 26

Possessions +2 large adamantite greatsword, +3 amulet of mighty fists, +4 bracers of armor, minor cloak of displacement, ring of x-ray vision, a human skull studded with sapphires (1,200 gp), map of Zobeck tunnels and town above, sack with 235 gp.

The ecology of the basilisk

by Ed Greenwood

From an untitled tome in the library of Sulphon of Waterdeep, signed "Rhapsodel, Sage of Sages": (AD&D™ game notations and other comments added by the author appear in *italic inside parentheses*.)

Know, O sage, that a creature often asked about is the dreaded basilisk, whose gaze turns one to stone. It behooves a sage to wax wise and eloquent about this beast, for therein lies the seeds of much respect for yourself and your learning.

The basilisk is a large, reptilian brute that is both slow and stupid. It is feared for its infamous gaze, which can at will turn creatures (including both fish and fowl) who meet it to stone. So much any half-wit can tell you, but mark well the words that follow, for here is set down all that is known of the truth about the gaze of the basilisk.

Precisely how the creature's gaze works is a mystery; most learned observers agree that the creature's eyes emit a radiation that if absorbed by the eyes of other creatures — or even itself, if its gaze is reflected back upon it — causes an inexplicable chemical change in the bloodstream, altering living flesh to stone. (*Stoned creatures are immediately paralyzed, unable to speak, see, or feel. They will become unconscious from lack of air at the end of 1 round, but until then are capable of mental — i.e., psionic and some magical — activity. Any spell or device supplying air, or removing the need for it, such as a necklace of adaptation, will allow continued mental activity, with a cumulative (intelligence score +1% per turn) chance of insanity due to helplessness and total isolation.*)

Clothing, accoutrements, and the like carried or worn by victims are not affected, despite some wild tales to the contrary. Beings who through natural ability or the use of magic are in *gaseous form* are also apparently immune to the effects of the basilisk's gaze. (*The use of invulnerability potions allows a saving throw vs. petrification at +2. Any rings or cloaks of protection being worn add their bonus to the saving throw.*)

A basilisk has two translucent eyelids, somewhat like the membranes covering the eyes of a frog, that can at will cover each of its eyes: an upper eyelid, which drops from above, and when thus closed overlaps an inner, lower eyelid, which rises from below the eye. With the upper and lower eyelids

covering the eyes, a basilisk can see up to 15 man-lengths away (9" in AD&D scale) in normal light, much as men do. Each eye's lids operate independently of each other, and are controlled by the creature; it need not blink at all, if no irritants get into its eyes.

When the upper eyelid (only) is drawn back, a basilisk's eye sees up to 18 man-lengths away (11" in scale) on the prime material plane, with the benefits of both ultravision and infravision. Or, by concentration, it can scan the astral plane, seeing up to 12 man-lengths distant (7" in scale), or the ethereal plane, seeing up to 18 man-lengths away. A basilisk cannot see on more than one plane at once, but unless they are actually fighting or hunting in one particular plane, basilisks tend to flick their gazes from plane to plane every minute (*every round*), and thus remain aware of their surroundings in all three planes.

When its inner, lower eyelid is also drawn back — and both eyelids can be raised and lowered again in less than five seconds — a basilisk's gaze petrifies all who meet the stare of one of its eyes on the prime material plane, slays all who meet its stare on the astral plane, and turns ethereal creatures who meet its gaze into inanimate, insensible "ethereal stone." Note that a basilisk's eyes are on opposite sides of its head, and thus it commands a very wide field of vision (*a 260-degree arc*), and can conceivably stone creatures to either side of it — two, in total in the same minute.

Fortunately for those who encounter it, the basilisk is not particularly energetic or cunning, and it simply will not comprehend the properties of a mirror or other reflective device if such is maneuvered into position, and will readily "stone" itself if such precautions are successfully applied.

Petrified creatures cannot be eaten by basilisks, and they will therefore strike with their petrifying gaze only at creatures who by size or aggressive behavior seem threat-

ening to them. Petrified victims are subject to all of the effects that stone normally suffers. (*These effects include chipping, frost damage and other weathering, attacks from a horn of blasting, etc., and these may well destroy the unfortunate individual. Contrary to some fireside yarns, stoned people who are chipped or shattered do not bleed. Petrification does not otherwise slay creatures, who are held in a sort of suspended animation, or "stone sleep." Protective devices retained by a petrified victim — a cube of frost resistance, for example — will continue to function.*)

Basilisks eat all types of small creatures (including both fowl and fish), carrion, and some berries. They cannot eat or physically attack creatures not on the prime material plane, and apparently only use their gaze attacks in a defensive manner with respect to creatures thereon. It should be noted here that some sages dispute this point. Further research, dangerous though it is, will be necessary to remove all doubt as to the powers of the basilisk on the astral and ethereal planes, and possible prey it may seek from those planes.

Basilisks instinctively avoid looking directly at other basilisks, and they never deliberately use their stoning gaze on one another. They can recognize fellow basilisks by both sight and smell, and although their sense of smell is not noticeably keen with respect to hunting down other creatures, it is sufficiently acute to distinguish between individual basilisks; i.e., mate and young are readily discerned from strangers.

Any basilisks encountered will be solitary hunters, a mated but hunting pair, a nesting pair, or a pair with grown but immature young still sharing a lair. Such young often accompany their parents for up to three seasons, until they are ready to mate, whereupon they leave their parents and each other to seek out their own mates. Basilisks mate for life, and by instinct breed every four summers — usually in water,

which helps to support their slow, heavy bodies. One or two days after mating, the female lays a cluster of greenish-white eggs (from 1-8), each about the size of a man's fist. Basilisk eggs have soft, warm, stretchy surfaces, and they withstand crowding or even gentle handling and tumbling without harm; they cannot break the way a duck's or hen's eggs will shatter in similar circumstances. A basilisk parent often picks up an egg in its mouth to carry it, drops it in a new location or to defend itself, or rolls eggs about with its snout — all without doing the eggs any damage. After laying its eggs, a basilisk mother covers them in cool sand or half-buries them in cool, wet mud. The eggs are almost always (95% chance) fertile, and if they survive the nesting period of four to six weeks (31-50 days), they will hatch into miniature basilisks, 4 to 9 inches long, who have full gaze powers at birth. During the nesting period, the parents do not eat, all the while growing more and more irritable and fanatical in the defense of their nest and its surroundings. Hatchlings grow quite rapidly, reaching man-size in length (from nose to base of tail) in 4 to 6 months after they are born. During this growth period,

their parents hunt intensively with them and for them.

Like other reptilian creatures, basilisks are cold-blooded. They derive much of their energy from the heat of the sun, and spend much time sunning themselves on rocks or heights to gather this heat. (They will also often creep up to campfires at night for the same reason.) But unlike most reptiles, basilisks can tolerate a fairly wide range of temperature, and can also store heat efficiently in their coiled digestive organs; thus, they remain active on warm or mild nights, even in early spring or late autumn. (Basilisks who live deep underground always have ready access to volcanic heat — and if these subterranean creatures are kept from this heat source for any longer than a day, they will grow sluggish and ultimately perish within another three days.) Like their smaller kin among the lizard population, basilisks can regrow lost limbs and tails within 1 to 4 months, provided they have an above-average supply of food during this time.

Because of its fearsome petrifying power (which, it should be noted, is permanent; affected creatures are not freed by its

"wearing off"), the basilisk has long been a source of fascination and magical power to men. Mages and alchemists have found two parts of a basilisk eye particularly useful: the internal pupil, lens, and fluid of its eye which are used as ingredients in potions, spell inks, and the making of items (such as *eyes of petrification*) concerned with petrifying creatures; and the inner membrane or eyelid of the creature, used likewise in magic concerned with protection against petrification. Other parts of the basilisk are sometimes tried for such purposes, but with little or dubious success. An intact eye might bring as much as 1,000 gp from an alchemist; parts of it, such as the eyelid or fluid, up to 400 gp each. Prices vary with demand, of course, as with all rarities, and have been known to reach ten times these amounts.

Various individuals have attempted to use basilisks as guardians, usually chained in a particular location, and fed by hooded attendants, or led about by them with a collar and several chains. This tactic can be effective, but eventually fails more often than not simply because of the nature of the beast and its powers. Basilisks are stupid, lazy, and often asleep. If they feel secure — they are not intelligent enough to remain constantly vigilant if no obvious threat is afoot — then they will not look about and repeatedly scan all three planes, and at such times they may be slain or hooded from the rear without great danger to the intruder or interloper they are supposed to be guarding against.

And even if a basilisk guard is successful in its stoning attack, the victim is impossible to interrogate (or rescue, if the wrong person is petrified by accident), and difficult to move out of the way — except by the use of expensive spells and magic items. If more than one basilisk guard is used in the same general area, they inevitably stone each other when tricked by cunning intruders, and starving or beating the beasts does not improve their drowsy indolence or lack of alertness. They are simply too stupid to be trained where to go or not go, or to distinguish between acceptable victims and persons who are not to be petrified. Despite all this, intact basilisk eggs usually bring up to 500 gp each, and a miniature young one is worth as much as 700 gp. Mature, less tractable specimens usually carry a price of 450 to 500 gp.

The effective petrifying range of a basilisk's gaze seems to be a function of how keen the eyesight of its victim is; although this tends to be only up to about 5 man-lengths distant (3 " in scale), cases have been reported of wizards employing *wizard eye* spells being stoned by basilisk guardians, and persons employing *crystal balls*, *eyes of the eagle* and similar devices being petrified at great distances.

At present (*the time of Rhapsodel's writing is unknown*), little else is known of the nature of a basilisk's gaze. The foremost authority on the subject is widely believed to be the sage Krammoch. of Baldur's Gate.

THE ECOLOGY OF THE

BEHIR

When most adventurers think of enormous, reptilian beasts, dragons immediately come to mind. However, dragons are not the only scaled giants to instigate fear, respect, and sheer awe with their mere presence. One such magical beast combines the voracity of an entire pack of starving predators with unchecked draconic deadliness: the behir.

Bestial yet canny predators, behirs prowl broken hills, wastelands, and barrens looking for food enough to fill their considerable gullets. With surprising cunning disguised by their monstrous appearance, behirs offer those expecting to face nothing more than a dumb beast only a slow and painful digestion.

HISTORY OF BEHIRS

Behirs exhibit numerous traits that suggest an unnatural genesis. The most common theory posits that some enormous, magically altered snake or lizard—possibly even a manifestation of the gods Merrshaulk or Apep—bred with

a powerful blue dragon in a time long past. The offspring of this bizarre union lacked the intellect of their draconic parent but exhibited the lightning breath weapon, thick hide, and spiny crests. Over time, these aberrant dragon spawn managed to propagate their own species and broke from draconic society to take up lairs in the wilderness. Most dragons, especially blue dragons, completely deny such theories, seeing behirs as nothing more than abominations that should be destroyed whenever possible. However, a few dragons (typically metallics) confirm hints of truth in this possible genesis, although none admit the full story—if indeed any truly know.

An alternative theory suggests that it was in fact a blue dragon that created the first behirs. Seeking guardians akin to half-dragons, yet more powerful and easier to control, a draconic sorcerer began meddling with the blood of her own kind. Either by breeding with a magically summoned being or tampering with her own unhatched eggs, the blue dragon created a clutch of deadly yet dimwitted offspring.

Whether these feral sub-dragons turned on and cannibalized their mother or she grew disgusted with her unnatural brood and drove them from her lair remains unknown. Frequent observations, however, demonstrate that blue dragons revile and actively hunt behirs, while behirs fly into a rage at the merest mention of dragons of any color.

Regardless of tales of their draconic heritages, behirs prove physically (both internally and externally) very different from true dragons. As such, varying theories of their actual genesis prove far-flung and often radically conflicting.

PHYSIOLOGY OF THE BEHIR

While superficially resembling dragons, behirs are more akin to gigantic snakes than true wyrms. A full-grown behir reaches at least 40 feet in length and weighs approximately 4,000 pounds. Their extremely tough and scaly hides bristle with armored ridges and vary in color from electric blue to nearly purple with bands of brown. The underbellies of male behirs exhibit a lighter hue, typically

KNOWLEDGE OF BEHIRS

The following table shows the results of a Knowledge (arcana) check as it relates to behirs. Those who study magical beasts, as well as inhabitants of the dry, dusty barrens that these monstrosities call home, are most likely to possess this information.

Knowledge (arcana)

DC Result

10	Behirs are wingless, twelve-legged, vaguely draconic beasts capable of blasting foes with their electrified breath.
15	Behirs territorially claim wide swaths of land and “rule” them from rocky spires and plateaus. Using their powerful jaws to snatch up prey, behirs either fatally constrict such prisoners or swallow them whole.
20	Behirs are intelligent yet brutish creatures capable of speaking Common and possessing egos as large as their monstrous bulks. A behir’s multiple legs make it a masterful climber capable of scaling most any surface.
25	Behirs hate all dragons and blindly attack them on sight. The breath weapon of a behir takes a relatively long time to recharge once used, yet this innate affinity for electricity makes behirs immune to all electrical attacks.

a pale blue, while female underbellies near shades of white highlighted with streaks of azure. All behirs sprout numerous large horns that curve backwards from their heads and continue down their serpentine necks. Largely ornamental, these horns act as an indicator of the beast’s age (growing for a behir’s entire life) and

are frequently used in preening hard-to-reach scales.

Behirs possess a dozen short but powerful legs capable of tucking up neatly along the sides of their bodies, allowing them to either slither along like a snake or gallop in an undulating stride. They prefer using their snake-like locomotion when traveling any

considerable distance, as it makes moving across the broken landscapes they usually inhabit far easier. Behirs commonly only use their legs when climbing or feeding. Both because of their numerous legs and their comfort while slithering, it's impossible to trip or knock over behirs.

Overly large, a behir's mouth sports dozens of thin, needlelike teeth that curve inward for the purposes of grabbing meat and tearing it in large gob-bets. A behir cannot chew food with any particular ease and spits out anything it cannot swallow entirety. The throat and stomach of a behir are equally over-sized, capable of swallowing entire creatures whole. When filled, an incredibly powerful acid floods the behir's stomach that reduces flesh to a nutrient-rich chyme in a matter of minutes. The rare items a behir cannot digest (such as exceptionally resistant substances like adamantite) it regurgitates in a slow, awkward process within its lair.

A portion of the energy behirs generate from their food goes to fueling a number of strange, almost glassy organs that run below the thickly armored plates of their necks. Far different from the *draconis fundamentum* organ that produces the breath weapons of true dragons, these coarse formations are arrayed in a state of constant friction, shifting and colliding against one another as a behir moves. This constant friction gathers within several chambers inside the behir, waiting to escape in a bolt when the creature opens a specialized chamber within its mouth. Sometimes this energy escapes in ribbons that ripple over a behir's tongue or crackle over its spines,

especially when the creature becomes agitated or otherwise excited. These formations require almost exactly 1 minute to generate enough friction to create a blast of electricity deadly enough for a behir to use as a weapon.

Not far from these charged structures rests a behir's brain. Large and complex enough to facilitate a behir's sentience and capacity for speech, this organ is in no way as complex or advanced as a dragon's brain. Also, perhaps due to

the electrified organs nearby, behirs are prone to violent mood swings, far-flung leaps of reasoning, and spasmodic muscle actions.

Perhaps another effect of the electricity that at times seems uncontrolled within their bodies, behirs live fast and burn out quickly, rarely living beyond forty years. However, possibly as a result of some aberrant origin, a behir's maximum age varies extremely from one to the next, with some dying of old age in their thirties while others live well into their hundreds.

PSYCHOLOGY AND SOCIETY OF THE BEHIR

Behirs prefer inhabiting dry, rocky hills (although rumors of jungle and desert behirs persist), basking in the scalding sun between hunting forays and patrols of their territories. Frequently lairing in cliffside caves, plateaus, rocky spires, or other high natural hiding spots, behirs seek out homes that afford them a view of the surrounding lands and prove difficult for creatures unable to climb sheer surfaces to access.

Most behirs live solitary existences, claiming all the land visible from their lairs as their territory. As behirs favor lofty homes, a behir's alleged domain might span dozens of miles, with its lair always at the center. However, these contended dominions are regularly exaggerated, possibly encompassing the prior claims of other creatures, or even whole cities a lone behir could never hope to overtake. Regardless, behirs are violently territorial creatures and attempt to drive out any beings they perceive as threats, while subjugating weaker creatures. This often leads to lengthy conflicts between behirs and humanoids or other powerful monsters, all with equal belief in their ownership of the land.

In the cases where behirs win such disputes, whole regions of weaker creatures might pay homage to a single behir as landlord—or even deity. Although physically powerful and intelligent enough to communicate, behirs make poor leaders and worse rulers. Little more than oversized, self-interested bullies, behirs care nothing for the “weaklings” that dwell within their territories. Rather, they treat such vassals little better than slaves and livestock, often demanding ridiculous tributes of food or wealth. Also, due to their often sporadic mood

swings—often blamed on the powerful electrical discharges occurring in such close proximity to their brains—behirs quickly neglect or forget responsibilities and promises. Such shifts commonly occur every 5 to 10 minutes and might prove dangerous, as a behir can seem agreeable—even playful—one moment and suspicious or antagonistic the next.

Despite their brutishness as rulers, behirs are not innately evil creatures. Although particularly foul-tempered exceptions that cross the line surely exist, most behirs adhere to a neutral outlook. However, this neutrality combined with a relatively low intellect and great physical prowess makes behirs exceptionally self-concerned. Canny humanoids might use this sense of self-superiority to their advantage, as behirs are highly susceptible to flattery, especially pertaining to their horns and size.

Behirs are immune to electricity and relish roaming or climbing to the peaks of their lairs amid thunderstorms, becoming quite excited and agitated when the lightning begins to strike. The mating cycle of behirs coincides with the hottest days of summer, when electrical storms rage most frequently. During such times the swift popping bellows of behir mating cries mingle with regular crashes of thunder. Travelers should be extremely wary of wandering through an agitated behir's territory during this time of year and especially in the middle of such a storm.

Occasionally, in areas with a large enough food supply, a mated pair of behirs bond for several years—usually somewhere between two and twelve. A pair of behirs usually produce one small clutch of between eight and ten eggs. These eggs resemble large geodes tinged with electric blue lines, similar to lapis lazuli, and might be mistaken for huge blue gemstones. Typically, only half of the eggs produce live young, and only half that number survive the first few weeks of life. This relatively high mortality rate keeps behir numbers in check, especially considering the huge amount of food required to sustain even one in an area.

BEHIR AMBUSHES

Devious creatures with a variety of lethal abilities, behirs make deadly opponents even on level battlefields. However, with the instincts of a predator, a behir never chooses to attack unless it possesses a distinct tactical advantage.

Tunnel Attack: Although not skilled tunnelers, behirs are particularly adept at navigating and detecting threats underground. Either making use of the natural crevices of the terrains they favor or intimidating servants into creating tunnels, behirs often lie in wait within such depressions. When prey nears, a behir can extend its head and neck from the hole and attack with its breath weapon while the rest of its body remains below (granting it cover). If its targets instead become threats the behir can slip underground, where few creatures would dare follow, possibly even arising from another opening to attack again.

Shanghai Strike: Swift predators with the ability to climb sheer surfaces, behirs can outmaneuver most opponents. Even if a group looks too powerful for a behir to attack head-on, it might strike anyway, grappling or swallowing a single opponent, then retreat up a cliff or elsewhere its enemies can't follow. In this manner, it might dispatch its foes one at a time while subjecting itself to the least danger possible.

Death from Above: A behir's attack more likely originates from a cliff face or cavern wall above its adversaries than from directly in front. Capable of moving in directions most opponents rarely consider, behirs use such tactics to their advantage and attack from above whenever possible. Such arrangements also allow behirs to knock down rocks and cause cave-ins (much like the Stone Blocks from Ceiling trap on page 71 of the *DUNGEON MASTER's Guide*).

BEHIR AND NOW

Long a piece of D&D history, the behir numbers with the bulette, mind flayer, and dozens of other monstrosities as a unique creation of the *DUNGEONS & DRAGONS* game. First appearing as a new threat in Gary Gygax's famous 1982 adventure, *S4: The Lost Caverns of Tsojcanth*, the behir found good company among the first published descriptions of demon lords like Baphomet, Graz'zt, Kostchtchie, and even Fraz-Urb'luu (see page 24 of this issue). The behir has also recently been reinterpreted, bigger and more deadly than ever, as a Huge model in the *Giants of Legend* expansion for *DUNGEONS & DRAGONS Miniatures*.

Behir mothers raise their young for two years, first providing hatchlings with regurgitated meat before teaching them to hunt small animals. Male behirs take little interest in their young, except for occasionally providing them with food and doing them the service of not ingesting them.

After the second year, the mother behir drives out the surviving juveniles with blasts of lightning and thunderous bellows forcing the young to find their own territories. Most behirs that become threats to humanoid settlements are juvenile behirs seeking their own domains.

Behirs and dragons are dire enemies and never willingly tolerate each other's presence within their respective territory. When a behir and dragon catch sight (or scent) of each other, bloodshed inevitably follows. Those who witness a battle between a behir and dragon recall it with awe, as both creatures assail each other with breath attacks and gouge scale, muscle, and sinew with razor-sharp claws and teeth.

Besides dragons, any large animals (including humanoids) that wander into a behir's territory are considered food first and potential bargaining partners second. Behirs possess the capability to negotiate but only do so if they believe that for some reason they can't take what they desire. Those who must frequently travel through a behir's territory find that offering large amounts of food (such as a cow or a horse)—along with a healthy amount of self-depreciating flattery—is a good way to keep a behir from attacking. Additionally, perhaps owing to some draconic ancestry, behirs have a fondness for treasure, coveting silver to the exclusion of all other offerings. If properly wooed with such riches, food, and compliments, some behirs might be convinced to reveal information or perform favors for lesser creatures.

VS. BEHIRS

Although nowhere near as intelligent as an average human, behirs possess numerous deadly abilities and enough intellect to make clever decisions and plan attacks with cunning and reason.

Beware the Breath: Like a dragon, a behir possesses a breath weapon—a line of lightning that deals terrible damage. Behirs can only use this ability once every 10 rounds, meaning that

they purposefully maneuver themselves to line up foes for maximum effect. A behir frequently identifies the most dangerous-looking enemy and unleashes its breath weapon on him first in hopes of killing him off before closing in to melee combat.

A behir is also smart enough to avoid attacking those unaffected by its lightning breath a second

such a battle proves unavoidable, spells like *bull's strength*, *freedom of movement*, and *grease* should see generous use.

Getting Out of the Gullet: Those who do fail at grappling with a behir are likely to be swallowed, where they face precious few choices for escape. Those expecting to battle a behir toe-to-toe should prepare with spells like *resist energy* to prevent acid damage within the creature's stomach and

carry at least one (preferably magic) dagger or other light slashing or piercing weapon to cut out of the creature's gizzard. A spiked gauntlet is an ideal weapon—allowing a behir's swallowed opponents to attack without having to

draw a weapon first.

Avoid Grappling: When initiating a grapple—almost always using its bite and improved grab ability—a behir's formidable grapple bonus (at least +25) practically ensures a good grasp on a victim. The round after achieving a hold, a behir constricts before unleashing its fearsome rake attack. This rake attack is the only means in which a behir can bring its numerous but relatively short claws to bear, and thus it makes use of this attack whenever possible.

As this series of attacks proves so common when facing behirs, adventures should seek to avoid melee combat with such creatures at all costs. If

draw a weapon first.

Adroit Ambushers: Once alerted to the presence of enemies, behirs favor attacking by surprise. A behir's decent Hide bonus allows it to remain out of sight from all but the most observant creatures, while its skill at climbing lets it plan ambushes from the most unexpected directions (see the Behir Ambushes sidebar).

Behirs With Character Levels: Possessing a better-than-average Charisma, it's quite possible that an advanced behir might take levels in sorcerer. Alternatively, some behirs advance as barbarians, augmenting their already formidable fighting prowess with rage and enhanced speed.

The Ecology Of the Behir

*An excerpt from the tome **Creatures of the Wilderlands**, by the sage and explorer Radamust:*

One of the most malevolent creatures I have ever encountered is the behir. Having nearly fallen victim to its depredations on two separate occasions, I have endeavored to learn more about this wild and curious beast, which is occasionally mistaken for a wingless dragon by the uneducated.

A behir is unmistakable to the learned, once you have seen it. It is a twelve-legged serpent, with each foot bearing three toes that end in razor-sharp talons. These talons are hooked like a raptor's but are designed for slashing, not grasping, prey. The body is covered in bandlike scales from light to dark blue in color with grayish tints along the edges. The underside is also light blue and composed of a vertical row of banded scales. The upper scales are very hard and tough and, if treated correctly, can be made into serviceable armor.¹ The head is long, and the narrow mouth is filled with many sharp teeth. Two backward-curving horns project from the rear of the skull, each black in color and 3-4' in length.

Upon beginning my investigation, I discovered there was more than one species, each with its own special abilities and wildly divergent habitats. However, thankfully, these two other species are much rarer than the common (or lightning) behir, and are rarely encountered by anyone who is not an explorer or a savage, for they inhabit the fringes of the world: humid jungles, deserts, and volcanic plains. Because of their rarity, I was unable to discover much beyond their habitats and have named them accordingly: desert behir and jungle behir. Numerous tales have been told of them, each giving various descriptions of these beasts. Most

are too fanciful to believe. I will assume their natures are much like that of the common behir until more is known.²

The common behir is a violent, destructive creature that frequents mountainous and hilly terrain as well as open plains and temperate forests. It never remains in one area very long, even if prey is plentiful, and thus never accumulates much in the way of spoils. Its den is usually a cave or well-hidden thicket where it rests while it is not hunting. It never brings prey back to its lair, preferring for the lair to remain unnoticed by scavengers and thus unlikely to draw attention to the behir there.³

Behir are active during the day, though not exclusively, and they sleep during the moonlit hours. They prey on all creatures smaller than they, particularly medium and larger mammals such as boars, though they will also attack humans, ogres, and elves. Being reptilian in nature, behir

several days recovering from their gluttony. Common behir hibernate during the winter and spend much of their time fattening up before its onset.⁴

Though massive and bulky creatures, behir are surprisingly quick and nimble, capable of overtaking human prey though not horses. They also climb remarkably well and can move straight up the face of a mountainous cliff. When full grown, behir often measure as much as 40' in length, though being reptilian they never stop growing. Enormous shed scales have been found that indicate some ancient specimens might be 60' long.

Although only dimly intelligent when compared to humans, behir have a terrible natural cunning and are quite adept at acquiring prey by simple means. They prefer to attack from ambush, and openly confront only small groups of creatures. A pair occasionally works in concert to obtain prey, one flushing prey into the waiting claws and jaws of the other, but this working together seems to be unintentional, as behir are unsociable as a rule and will fight over a large kill.

A behir can attack in numerous ways, most commonly by biting and, by rearing up on the hindmost eight legs, clawing with the four foremost legs. The behir can also wrap its upper body around a large victim to crush it, a tactic that also allows it to make two to six talon attacks on the victim (depending on the latter's size) until the victim dies or manages to break free. Having witnessed a mercifully brief battle between an ogre and a behir, I can attest that even ogres find this a daunting task and are unlikely to win such a struggle. Less commonly, a behir will ram an opponent with its forehead or trample it underfoot. Both of these attacks can be fatal to smaller creatures, although they are fairly easy to avoid.⁵

On account of their size, behir can swal-

SCHWARTZ

low man-size or smaller creatures whole. The chance of this occurring is not very large, but once swallowed, there is almost no chance of its prey escaping alive. The digestive juices are strong enough to corrode and dissolve metal in a few days, flesh in a considerably shorter time. Needless to say, I have seen no one survive being swallowed. However, the acid is not strong enough to dissolve gems or glass and these sometimes will be found inside the stomach of a behir, the only treasure they will possess.⁶

Before I could continue my study of the beast, I needed a dead one for dissection. Rather than risk life and limb in this pursuit, I employed cunning that I thought even a behir would be proud of. Knowing from my studies that behir are not averse to adding carrion to their diet, I poisoned the body of a dead ox and left it for a behir to find. However, the ploy was a failure, for no matter what poison I used, the behir walked away unscathed. Apparently the strength of its digestive juices somehow destroyed the poison before it could take effect. Poisoned missiles also had no effect, and I was at a loss to explain why until I found that the behir has a thick layer of fat under its scales, like a pig. This explains why poison from arrows never gets to its bloodstream.

The most dangerous aspect of a behir, however, is its ability to generate a bolt of lightning, perhaps in the same manner as a blue dragon. This bolt is roughly seven yards long and is directed from its mouth. Upon studying the remains of the behir I finally managed to obtain, I have discovered a few clues to how this might be done, but nothing conclusive. A large organ with an unusually high concentration of metals lies adjacent to the stomach. This organ is connected by a system of nerve structures to another, smaller organ in the back of the mouth. Again, the smaller organ has a high concentration of metals. I hypothesize that an electrical current is produced in the larger gland by some as yet unknown method, then stored in the smaller gland until discharged. The behir seems to have complete control over this ability and is able to fire this bolt as often as five or six times per hour.

Perhaps to supply these organs, behir ingest fairly large quantities of metal, preferring copper and silver over all others. Few items of metallic nature are found after a behir has slain a victim. Occasionally, a behir can be distracted by great amounts of copper or silver coins, allowing passage or not attacking, but only if the behir is well fed beforehand. The high metal content in the behir's bodily systems seems to have an added advantage in that they are themselves unaffected by electrical discharges in any form. Exactly how the behir uses the metal it eats or how it is involved in the generation of and resistance to the lightning is unknown, but I plan to continue my research into this

interesting phenomena.

At this point I would also like to hypothesize on the natures of the other species of behir. Although unable to examine one close at hand, I have heard stories that lead me to suspect each species has its own ranged magical attack, probably working on the same general principles as those of the common behir. From this and other aspects of its nature, I believe that behir are magical in nature and are the result of some ancient magical experiment of wizards or godlings—as so many beasts we know seem to be. Perhaps time and further research will tell.

Behir grow steadily and are able to mate by their tenth year, the point at which they can be considered adults. Behir can live as long as 50-60 years in the wild, but few actually reach that age as most are killed by predators before then. Mating takes place in early spring, with the pair choosing a secluded cave in which to live during this time. The female lays 1-4 eggs, blue-green in color and about 2' in length. The eggs are leathery like a snake's, and they are buried under a light layer of sand or dirt. During the time it takes the eggs to hatch—three to four weeks, normally—the female remains on guard at the nest. The male forages for both.⁷

But parental attitudes do not last long, as the young are quickly driven from the lair after hatching and must fend for themselves. Few survive to adulthood, as any number of other monsters and foes—not the least of them being adventurers—will slay the young at any opportunity. It is possible to train behir if captured while only months old. Such behir can be taught to understand simple commands and even to speak a few words of Common, but they are capricious and wicked by nature, respecting only power, and this loyalty usually lasts from one meal to the next or until a more powerful master comes along. Thus, ownership of a behir can be a double-edged sword. A behir that is much larger than its owner is certain to strike out and become unmanageable.⁸

The behir, surprisingly for its size, actually does not upset its environment beyond its tendency to lay waste to civilized dwellings in search of two-legged prey. Granted, it is hated by all intelligent beings, which it in turn hates, but it eats relatively little. However, being so well armored, so large, and so well equipped with weapons as it is, one cannot imagine what possible good it serves except to torment humanity. Certainly nature would not miss this beast, and it may be that extinction at the hands of warriors and wizards will someday be the fate of this species. Would that it were gone tomorrow!

Footnotes

1. A trained armorer or smith can construct armor from a behir's hide. Such armor takes two to four weeks and 2,000 gp to construct. Equivalent to chain mail in

encumbrance, such armor provides protection equal to banded mail. Up to three man-size armors can be constructed from a single slain behir. Some armorers or smiths pay 500-1,000 gp for a behir's hide in good condition.

2. The other species of behir are detailed later. Both the desert behir and jungle behir are like the common behir in most respects, particularly in their destructive habits, general life cycles, etc.

3. There is a 5% chance of encountering a behir in its lair. If an encounter is indicated, there is a 75% chance that the behir is sleeping. Any undue noise, as well as any attacks, will bring the behir instantly awake.

4. Because of their reptilian nature, behir become extremely sluggish when temperatures fall below the freezing point, especially if the weather is cloudy. Thus, cold-producing spells, such as *cone of cold* and ice storm, reduce a behir's movement by half for 2-8 rounds. If the low temperatures can somehow be maintained, the behir will go nearly dormant, seeking only to defend itself from attack and escape the cold by whatever means possible.

5. It seems unlikely that a behir will constrict prey that is only of human size. If confronted with a human-size opponent, it will bite (2-8 hp damage) and rear back

GAMES STORE

to get four claw attacks (each doing 1-6 hp damage). If it meets an ogre, hill giant, bull, or similar large animal, it will bite (2-8 hp damage) and simultaneously wrap its body around the victim (doing 2-5 hp damage from crushing and abrasion). On the following round, the behir gives a slight roll to its body to bring its "interior" talons to bear on the entrapped prey, and it can bite (2-8 hp damage) and attempt six separate strikes with those talons (each strike doing 1-6 hp if it hits), though no damage from constriction will be done, as the body will have pulled back far enough to allow the talon attacks. If fighting a dragon, a behir could even wrap itself around the dragon an attempt to bring all of its claws to bear, biting and constricting as well, and perhaps using its electrical attack, too. The lightning strike is primarily used against spell-casting adventurers, dragons, and other dangerous foes.

A behir may also choose to butt an opponent (1-10 hp damage) or trample an opponent (4-16 hp damage). Both attacks are at -2 to hit against man-size or small creatures, but if successful such attacks stun victims for 1-4 rounds, not allowing them to attack, defend, or escape.

6. It should be noted that the strength of the acid is necessary to dissolve the metal items the behir eats. For this reason, no items of metallic origin are found in a behir's stomach. Only gems and glass objects are safe from the corroding effect of the acid. It takes a full day for the digestive acids to dissipate enough for safe removal of any gems or objects that might be in the stomach. If the behir is cut open before then, anyone who touches the stomach liquids will take 1-4 hp damage and, if a hand was used, be unable to grasp anything for 2-8 rounds from pain.

7. A behir grows according to the statistics in the Behir Growth Table. Rapid growth takes place during the first five years of a behir's life before it slows considerably. Young behir must fend for themselves while still quite young and, as noted by Radamust, few survive to adulthood. Those that do are extremely cunning and dangerous for beasts with simple minds.

For the three to four weeks it takes for the eggs to hatch, the female is always found in the lair, and the male is never far away. Although the male brings prey back to the lair for the female, they meticulously clean the area of remains to avoid drawing the attention of any predators. Both male and female fight ferociously to protect the eggs, gaining a +2 bonus to hit and damage when doing so.

8. Behir can be trained if caught within a year of their hatching. For this reason, young behir and behir eggs can be sold on the open market for 500-750 gp. Such training takes about two months for a skilled animal trainer, after which the behir can understand and speak Common as well as a five-year-old child. However, its natural tendency toward treachery can

never be removed; there is a 50% chance the behir will abandon its current master for a new one if approached properly. (This chance should be adjusted either up

or down by the DM depending on the circumstances.) By its tenth year, a behir will attempt to free itself and will become unmanageable in all respects.

Desert Behir: These creatures are found in deserts as well as volcanic plains. Their platelike upper scales range in color from yellow to orange, while the belly scales are fiery red. When attacking, the desert behir has available all the physical attacks of a normal behir. The desert behir's breath weapon, however, is a jet of flame, 20' long, that does 30 hp damage unless a successful saving throw vs. breath weapon is made, success indicating half damage is sustained. This jet can be used once every 12 rounds.

Jungle behir: As the name implies, the jungle behir is found in tropical jungles and rain forests. The large scales that cover the upper half of the body are emerald green in color, while the scales covering the lower half are a lighter coppery green. The jungle behir possess the same attack routines as the other behir types, but its breath weapon is a jet of acid that does 20 hp damage unless a successful saving throw is made. Half damage is applicable if the save is made. The jet can be used once every eight rounds.

Behir Growth Table

Age	HD	Size	Damage
0 year	3	6' long	1-4/1-2x4
1 year	4	12' long	2-5/1-4x4
2-3 years	6	20' long	1-6/1-4X4
4-5 years	8	28' long	2-8/1-6x4*
6-10 years	9	34' long	2-8/1-6x4**
11-15 years	10	36' long	2-8/1-6x4***
16-22 years	11	38' long	2-8/1-6X4
23+ years	12	40' long	2-8/1-6X4

* The behir gains its constriction attack during its fifth year (1-2 hp damage) as well as six claw attacks, regardless of the victim's size.

** The behir becomes an adult at age 10 and does 1-4 hp damage with its constriction attack.

*** At age 15, the behir gains its trampling and butting attacks. The behir also does 2-5 hp damage with its constriction attack.

The ecology of the Beholder

by Ed Greenwood
and
Roger E. Moore

"Many tales are told," began the sage, "of the dreaded eye tyrants." At the mention of this name, the restless students sitting around him in the outdoor amphitheater grew quiet. The sage smiled and continued. "You've listened to stories of these fantastic creatures, seemingly born to the art of destruction; wild tales of battle done with them, of the sorcerous powers of their many eyes, of their rich hoards of treasure. But few have cared to learn much of the habits and nature of these creatures. Know you now that I have studied the beholder for many seasons, and can tell you in truth what was not known before."

The sage paused and looked out at his youthful audience. "Some of you may be thinking about the good it would do to destroy the race of eye tyrants. Some of you may be thinking about the fame it would bring you to slay one, or the wealth it would have hidden away. . . . Well, no harm in dreaming." The sage's gaze fell upon a young boy who looked up at him with unusual intensity; the sage stared back at him, but the boy did not look away.

"Perhaps," he went on, "some of you may actually do battle with one of these monsters, for whatever reason. What I have to tell you may well save you and your companions as well."

The sage looked away from the boy and turned to a blank slate behind him. Producing a piece of chalk, he began sketching a diagram of the beholder with rapid but careful strokes.

"The beholder is shaped like a great sphere, almost the height of a man. The body is covered by several hard plates of chitin which overlap one another slightly, protecting the internal organs. A magical organ called the *levator magnus*, located in the center of the body surrounded by the creature's brain, produces an influence that causes the beholder to float in the air. This allows it to move about slowly, up and down, left or right, forward or back at a slow speed, like that

of a pacing man. No magical spell or device can negate this levitation, though beholders cannot resist the push of great winds; most of them lair underground where they may go as they will, while others move about in desolate, windless areas where few other creatures will go.

"From atop this armored sphere project ten eyestalks, each of which has a limited maneuverability and field of vision. These eyes, however, do more than just see. They are also able to project, instantly and at will, various spell-like powers of awful effect. Flesh may be turned to stone; armor, weapons, skin and bone disintegrated; charms may be projected, and the influence of death magic itself may be brought to bear.

"And there is also an eleventh eye, greater in diameter than the others, set in the midline of the spherical body. This great eye can project an anti-magical ray that negates the use of all spells, whether cast from a device or from the mind and hands. This ray is a faintly visible beam of grayish light, extending out from the eye in a conical shape up to 140 yards from the monster. This cone is one foot across at the eye, and reaches ten feet in diameter at its greatest extent. This beam will focus upon one target at a time, and may be shifted to keep track of a moving

opponent. This beam has proven the downfall of many would-be slayers of an eye tyrant."

The sage tossed the chalk aside and rubbed the dust from his hands. The class was utterly silent.

"The diet of beholders," he continued, "is widely varied; of necessity, of course, since they can easily defeat most creatures, and thus soon exhaust their food supply in any given area. They vastly prefer raw meat, in large quantities, though they may also consume plant matter and small quantities of gravel to aid in digestion. They are omnivores who seem able, given the opportunity, to endlessly gorge themselves. Waste matter and indigestibles like bone they spit out, far enough away from their lairs to avoid betraying the hiding places of their wealth. They seem to prefer the flesh of horses, cattle, and humans."

Turning to the slate again, the sage picked up the chalk and sketched out a triangular shape. "You should all be familiar with the food-chain pyramid; at the bottom are plants, upon which feed the herbivores, upon which feed the carnivores, and so forth. Beholders sit at the top of the pyramid, preying upon all things. Because of their power, however, they must spread out widely to allow one

another food enough to eat, and to avoid competition. It is almost unknown for more than one beholder to be seen at a time, though it is known that they will cooperate with their own kind, and they can speak with each other in their own tongue.

"Though evil, they are prone to lawfulness as well and may take on servant creatures by duress or charm to serve as guardians of treasure, or as guardians of the beholder's personal safety. These servant creatures are also a means of implementing the eye tyrant's plans to carry destruction to all other life it encounters, and accumulate magical treasure. Gargoyles are highly favored for such uses, since they are too stupid and too undisciplined to resist the beholder's demands, and not powerful enough to give their master discomfort and perhaps bring about their annihilation."

The sage paused for a breath, then continued with, "We now come to reproduction." While this topic usually brought smiles and giggles to the faces of the class, now the students watched the sage with complete attention. "Once a year, every beholder lays a clutch of one to four eggs, each about a foot in diameter, by expelling them from the internal organ that produces eggs and spitting the eggs

from its mouth. These eggs are dead-white, spherical, and leathery in texture and appearance. They have a repulsive odor that repels predators, but which unfortunately leads the more dedicated foes of the eye tyrants unerringly to the clutch.

"The laying of eggs is instinctive, but the beholder consciously chooses the site where the eggs will be left — always far from its lair, and usually upon a rocky, desolate height. Such spots have been used by beholders over many centuries, and it is thought that all such creatures remember their birthplaces and return there to lay their eggs. After being laid, the eggs will hatch in two to twelve months; egg-laying and hatching occur in no particular season.

"Once laid, the eggs are left alone to their fate. Few beholder eggs hatch any more; humans, demi-humans, and humanoid races all will go to great lengths to destroy them. And the influence of nature, with its storms and diseases, must be accounted for as well. Those eggs that survive will swell and grow over time until just before hatching, when they are three feet across. The young beholder then expands suddenly, splitting the shell apart, and it is free. At this time it eats its own shell, and is

immediately capable of using all the powers of its parent. Its bite is less powerful, much like a dagger thrust in effect, and certain of its magical influences are at reduced effectiveness, but it will grow within a year's time to be as dangerous as any other of its race."

The sage settled himself against the stone table he used for a lectern. "The life span of a beholder is unknown, but thought to be very long indeed. One specimen has survived, if the legends about it can be trusted, for nine hundred seasons. As for social and philosophical aspects of the beholder's existence . . . your guesses equal mine for accuracy. They desire the extinction of all species but themselves and those they can manipulate to increase their power and influence. This is almost all that is known of their innermost thoughts and designs."

There the sage paused and looked about the class expectantly. After a moment, the young boy who had caught the sage's attention earlier spoke up. "Teacher," he said, "what is the best way to kill one of them?"

I knew you would ask that, thought the old man to himself. He looked over the heads of his audience, at a point far away. "The best way to kill one of them . . . That is difficult to say. In combat,

beholders prefer not to close with an enemy, and will stand off a distance to use their spells. The little eye that performs telekinesis will come into play first, to hurl missiles at its opponents, catch light opponents and cast them into the air to be dropped, or to deflect oncoming missiles one at a time.

"The great eye, with its anti-magical influence, will focus on anyone who appears capable of spell casting, that is, anyone not wearing armor. As for closing with it, that cannot be done in the outdoors since it will levitate itself up out of the reach of weaponry, while tilting itself and allowing its eyes to continue to do their work. Perhaps the best way to slay one would be to attack it at long range with masses of archers, stout and paid well, and supported well by magic-armed fighters in case gargoyles lurked about. One could put poison in baited traps to catch the creature unawares, though a long wait is assured. One could use arcane and enchanted devices at either a great range, or at a closer range with the aid of protective rings or cloaks, and hope that the protection is enough. . . ."

At this juncture the sage's voice faded away as he looked into the eyes of the boy who had asked the difficult question. He remembered that the boy was a member of a nearby church, one that was rather strict and on the militant side, but a good church nonetheless. . . . And wasn't it

said that this boy was taking some kind of special training?

"Or," the sage went on, "someone who was immune to most of the magical powers of the beholder, such as a paladin with a holy sword — such a person could catch a beholder in its underground lair, and would stand a good chance of closing with it to destroy it in combat."

The boy nodded, apparently satisfied.

After another pause, the sage dusted off his hands again. "Class is over. I will see you all again tomorrow morning." He reached around behind him for his books and scrolls and carefully piled them up to take them back to his library. Before he left he turned one last time to follow the progress of the boy who had asked the question, but the youth was lost in the crowd of children who were now scattering to the four winds.

"Good luck," said the sage in a soft voice, as if to himself. Then he too took his leave of the amphitheater, and all was quiet again.

Appendix

1. Whenever a hit is attempted on a beholder, roll percentile dice to see where the hit might land:

01-75: Hit vs. AC 0 body (takes two-thirds of hit-point total of beholder before creature is slain).

76-85: Hit vs. AC 7 main (11th) eye (takes one-third of hit point total of

beholder before eye is destroyed, but beholder still alive).

86-95: Hit vs. AC 2 eyestalk, one only; roll d10 and use chart on p. 10 of the Monster Manual to determine which eyestalk is hit. Beholders with 45-54 hp have eyestalks that take 8 hp damage each before being severed; 55-64 hp beholders have eyestalks taking 10 hp damage; 65-75 hp beholders have eyestalks taking 12 hp damage. If severed, eye in question will cease functioning.

96-00: Hit vs. AC 7 small eye, one only; roll d10 as above to determine which eye is affected. Any hit on a small eye immediately destroys it and its powers.

2. The magic resistance of a beholder is listed as "special" because of the anti-magic ray emanating from the 11th eye. The ray, as stated by the sage, only causes magic spells and spell-like powers to cease functioning within its area of effect; the "plusses" of a magic sword, for instance, would remain functional (since this is not a spell-like power), but a *wand of fireballs* would not be able to cast a *fireball* spell while the ray was enveloping it and its wielder.

3. Beholders are considered as aerial maneuverability class A, despite their slow speed.

4. Newly hatched beholders may be considered to have 45 hp, and *charms*, *sleep*, *slow*, and *death* spells they cast are saved against at a +2 bonus. Unhatched beholders are AC 4, have no attacks, and take 25 hp to destroy.

5. The spell-like powers of the beholder's eyes work instantly, in the first segment of a melee round, but must "recharge" for the rest of the round before firing again.

6. Beholders may levitate themselves without limit, to the height of the breathable atmosphere.

7. The arrangement of each beholder's eyes is different from nearly all others; referees should work out this detail prior to combat to determine which eyes may fire in which direction, since the small eyes cannot point in just any direction. Ω

h, but it was warm, and Mufti eagerly looked forward to reaching the oasis. It was there that he would replenish his waterskins, refresh himself, and water Mandrake. The sturdy war camel had been pushed hard during this chase. Given the freshness of the trail, it seemed likely that it would end soon with finding the woman and child in the oasis. And it was there that Mufti would have to defeat the genie who had stolen the two females; it seemed unlikely in this heat that they would travel during the day.

As Mandrake kept up his steady pace, Mufti pondered the character of his foe. Some genies were known to be cruel and uncaring, but one who stole a noble merchant's wife and child through enchantment was certainly to be despised. And the fact that this magical opponent could not be seen meant that it would have to be dealt with carefully. But the most grating aspect was the genie's blatant pride. To leave a note to the husband bragging of the theft had to be the height of vanity. Did not the Loregiver teach that the intolerant who mock those beneath them shall choke on their own self-righteousness? This genie apparently felt no guilt about violating Her teachings, and that, above all else, was a threat not only to the family in this matter, but to all inhabitants of the land. Yes, Mufti concluded, this genie would have to be destroyed.

Which was why the merchant Suleman had sent for a faris, one who would not only undertake the mission without fear, but one who would destroy the magical thief and return Afta and her daughter without any thought of despoilment. Mufti had volunteered readily along with several others of his class, but Suleman had chosen him—due, no doubt, to Mufti's greater accomplishments and his carefully cultivated reputation for purity of heart.

Just on the horizon the warrior spotted the dim outline of the oasis. He stopped, mopped the sweat from his brow with the sleeve of his aba, and concentrated. Yes, it was the oasis, not a mirage. No doubt the genie could see him by now as well, and battle would soon be joined. There was no opportunity or need for approaching subtly. While surprise would have been an advantage, in the end either Mufti's skills at fighting blindly would prevail or they would not. Fate would decree the result.

Yet one should not tempt Fate sorely, the warrior reflected, and he commanded Mandrake to kneel. After dismounting, he kept his eyes shifting about for any telltale signs of an approaching unseen enemy. He drained what was left in one of his last waterskins and kept looking. But there was nothing that gave any indication of an invisible enemy anywhere. No sudden sifting of the sands, no break in the heat waves, no sound, nothing. Well, oh magical

THE ECOLOGY

The Bird Maiden

Mufti's Two Masters

one, you want me fully clad, eh? So be it. My thirst for water is now quenched. Now my hunger for justice must be satisfied.

Mufti reached among the bundles secreted on Mandrake and unlimbered a carefully wrapped heavy package. Untying the knots, he took out a shirt of fine steel chain mail and, after a few quick glances all around, he put it on, suspecting that now would be a prime time for the genie to strike. But nothing happened, a little to his disappointment. Had the genie suddenly rushed in, it would have discovered that Mufti had grasped a sharp dagger concealed within the armor and had kept it in his hand the entire time, ready for instant use. The warrior sighed. Ah well, the genie apparently wanted him to come to the oasis. He pondered the matter some more. Since the wife and child probably would not remember the details of the fight once the enchantment was lifted, there was no sense in taking a chance. He reached into one of Mandrake's bags and pulled out a finely crafted bandolier that he slid over his chest and tightened. In it were three finely honed daggers, each one having a sunburst nicely etched into its blade, and they were joined by the fourth that had been hidden in the chain shirt.

All along Mufti had worried about being ambushed by his invisible opponent, but the genie now giving him the opportunity to get fully protected and armed was unsettling. All during this chase, it had not made the slightest appearance—no observations, no tracks, nothing. To be sure, everyone Mufti had questioned had seen the woman and child, and their tracks were quite visible once he had picked them up. But no one had seen anyone (or thing) with them. Perhaps the genie could fly and be invisible, an uncomfortable thought that caused him to scan the sky as well as the ground.

There—up above was a bird of some sort lazily circling. Peering intensely, Mufti finally recognized it, a desert owl up looking for a desert rat or snake for a mid-afternoon feast.¹ Hmm . . . could it be the genie in disguise? Mufti rebuckled his weapons belt nonchalantly, keeping his head turned just enough to keep the owl in sight, but it made no move toward him. Perhaps it lived in the oasis and felt disturbed by the genie's presence?

Certainly the owl would not have been uncomfortable with Suleman's wife, Afta. From everything he had heard from the farmers in the river valley, she was a

kindly lady, a kahina who had stopped along the way to cure a diseased oxen, share her water with an overheated farmer, and set the broken leg of a boy who had fallen from an apple tree. She had even spent an entire day with a village, instructing them how to better irrigate their fields.² So strange that the genie would have allowed her to do so, or perhaps it was that magical being's way of sneering at any pursuit by allowing such a clear trail. The latter was the more probable reason—otherwise it could have just taken the wife and daughter in its arms and spirited them all away, Mufti mused.

But Suleman's words of warning still remained with the faris. Afta was powerful in her own right and the magical garment the genie had placed on her, a veil of some sort, could make her a dangerous opponent as well. The upset husband had been most insistent: above all Mufti must remove the veil and bring it back along with wife and daughter.³ He had given the warrior a potion, one that he said would put the kahina and her daughter in a deep stupor. It was necessary, he said, because there was no telling what would happen or what the desert priestess would say once the veil was removed. Better to drug them. Mufti had suggested to Suleman that he simply destroy the veil on the premise that destruction of the enchanting item would negate the charm, but the fat merchant had replied quickly, "No, just bring it back. I would give it to the College of Wizardry for their research and use."⁴

Mufti unpacked his steel helmet from another bag and strapped it in place, then untied the shield carefully secured to Mandrake's saddle. His final steps were to pull out the carefully slung lance, then remount his camel. A few nudges in the side got the beast up and trotting toward the oasis. Time to get this done and over with. At least the sun was to his back. Still there was no sign of the genie; even the owl had flown away. Mufti entered the oasis unopposed.

It was a fine place with a clear pool of sparkling water surrounded by numerous date and palm trees, and most of the ground was covered by a nice mat of green grass. There were several piles of rocks and boulders here and there. Mufti had been to this haven three times before in his travels, and it looked as normal and as peaceful as before.

Except for the girl who sat by the pool. She was dressed in a fine aba and sat cooling her feet in the water, her sandals beside her. Laying a few feet away was a spear, another aba, a wooden case with a handle, and another, slightly larger pair of sandals.⁵ The girl looked at Mufti as he trotted up, and he was taken aback—the dark eyes behind the veil showed no surprise, relief, or fear—only a penetrating curiosity. It must be the daughter, Fatira, he decided—her body was far too unshaped and young (about ten years old) to be that of the mother. But where was the

mother? And, above all, where was the genie? Mufti kept one suspicious eye on the pool. The girl just stared at him.

"Little one, where is your mother?" he finally asked.

"Off," was her only reply.

"Off? Off where? And where is your abductor?"

The girl cocked her head, her eyes looking confused, then asked in return, "Our ab-duc—our what?"

"The one who took you and your mother away. Come, you can trust me, I am here to take you back to your father," the warrior replied, looking all around for any sign of danger. But all he saw was the owl again, fifty paces away sitting upon a boulder, busily tearing something apart and eating its fill.

The girl got to her feet, put her hands on her hips, and gave him a piercing look and a surprising scornful rebuke: "You mean to take me and Mother back? To my wonderful, loving father, who only talks about how he can't wait for a few more years until he sells me? If I were you, I would leave before Mother comes back, mercenary! She promised me we would never return! Now you just better go away before she gets back!" With that, she picked up the spear and pointed it threateningly.

The large war camel snorted and grumbled—it was not smart to make such a display to his master—but Mufti kept a tight rein and muttered some words of restraint. Well, the daughter was enchanted as well, just as Suleman had suspected, and it seemed to be a powerful charm since Fatira did not have the dim faraway look in her eyes that he had witnessed in those who had fallen prey to unscrupulous sorcerers, priests, and genies. Perhaps the genie had used two veils, one for the mother, and the other for this child?

Suddenly the girl screamed in terror, dropped her spear, and ran.

Mufti's reflexes, developed from years of training, immediately kicked in. In one fluid motion, he jerked Mandrake about, dropped his lance, and pulled one of the daggers from the bandolier. With uncanny speed, the dagger went sizzling through the air and buried itself in the wide open mouth of a large, toothsome, spotted canine. It staggered back, choking and gasping, and fell, rolling spastically in the grass.

Five more of the creatures were running quickly toward the warrior, shrieking a high-pitched racking laughter that resounded throughout the oasis.

"Run!" Mufti yelled over his shoulder, then added, "Climb a tree!" Then a second dagger found its mark, buried to the hilt in the chest of another of the monsters. The beast stopped, looked down helplessly at the dagger, and collapsed.

Cursedly powerful genie, Mufti thought. There was no time for another throw as the beasts were upon him, and he pulled the scimitar from its scabbard. Mandrake

responded to the quick nudges from his master and charged left, trampling another of the howling, devilish beasts under his large hooves. As Mandrake turned, Mufti slashed at the one that was jumping up to pull him from the saddle. It fell back, headless. But there were too many. One of the last two jumped up and caught Mandrake's neck in its jaws. And the last one vaulted up the back of the camel and knocked Mufti from his saddle. He hit the grass of the oasis with a thud, and there was an incredible burst of pain in his ankle, and the scimitar fell from his hand.

Instinctively, he rolled and slashed sideways with another dagger, but it only nicked the snout of his assailant, which jumped back with a shriek. Then Mufti tried to stand, but it was impossible. Something was wrong with his leg, and he was forced to fight on one knee. Breathing hard, the desert knight quickly surveyed the scene. The one who had knocked him from Mandrake was bleeding from the snout, but was approaching menacingly, no longer laughing but growling. A few feet away was the beast that Mandrake had trampled, but amazingly it was up, apparently unhurt. It shook itself, and then moved toward Mufti as well. Thirty paces away his prized war camel was thrashing about with the beast's jaws firmly clamped on its neck, and a sickening flow of blood was staining the grass. It was not a good shot but Mufti had to do something, so he threw his blade and just as quickly pulled out his last dagger. The monster on Mandrake was hit in its thigh, and the blow was enough to make it bark in pain, which unlocked its jaws. Mandrake staggered away, but collapsed just a few feet later. Mufti could see that it was a horrible bite, and knew that his camel would not last long. But the hyena left him alone, and loped over toward Mufti.

Mufti wondered whether he would survive this fight. Three angry hyenas (a little bigger than normal, he noted) faced him, and he had not even faced the genie yet! Mufti unsnapped the holder for his ceremonial hatchet and got it in his left hand. Then he quickly faked a throw with the dagger and scrambled on all fours for a tree as the beasts scattered momentarily. It was enough for him to get there and put his back to the tree, but the movement caused pain beyond words in his ankle.

The three hyenas recovered from the ruse, and approached slowly, laughing hellishly, and Mufti did not know whether it was in respect for his ploy or just to unnerve him. Not that it would take much at this point, he thought. One quick rush en masse would take him out.

As if they had been reading his thoughts, the largest gave a quick yelp and all three lunged toward the crippled faris. At the same time, Mufti heard a singing (a woman's beautiful voice, he thought),⁶ and he raised his last knife to throw. But the dagger never left his hands. Instead the two palm trees at his back suddenly came

to life like writhing snakes, and his arm was knocked aside. Then the warrior found himself wrapped tightly by a thick trunk, which wound around his body and over his face. What in the name of Kor—but he thought no more as the breath was squeezed out of him and he blacked out. The last thing he heard was the hyenas shrieking in panic. They were laughing no longer.

"Are you all right?"

Mufti shook his head slowly, groaned, and opened his eyes.

Kneeling over him was a woman in a plain tan aba, her nose and mouth covered with the strangest veil he had ever seen. It seemed to be made of light brown feathers tightly woven together. Her eyes were dark and curious just like the girl's had been, and Mufti suspected that if the veil were removed, the face would be beautiful. Her hands, elegant but strong looking, offered a cup.

He grunted his assent and sat up to drink—only to be reminded of his ankle by a blinding flash of pain. Despite his training he gasped and nearly fainted.

"Here, drink this, it will help the pain," she said. "It is all I can do until I regain my spells."

Breathing shallowly (his chest hurt too!), Mufti sipped, then gulped from the cup. A sweet taste, far better than he expected.

"My thanks," he croaked, "but why waste your potion, lady? Certainly the genie will kill me for slaying his beasts?"

She looked at him curiously, and started to answer, but then saw there was no need. The potion had done its work as the warrior slumped to the ground unconscious.⁷

Suleman al Fataq stretched, yawned, and belched loudly. One of the harem girls woke up, wrinkled her nose, and closed her eyes again, pretending to be asleep. The other one was not as smart: she turned over to see what was making bullfrog noises, and Suleman saw her.

"Do you have something to say, desert blossom?" asked the merchant, grinning widely, exposing his crooked teeth from behind his thick lips.

The woman shook her head vigorously. No woman in her right mind ever did anything to annoy the mountain of flab that was master of this house. His jolly appearance could quickly become a terror to whoever offended him, and in these circumstances it was best to say nothing.

And this morning she was lucky, because Suleman was in a good mood. He roared with laughter as he smacked the buttocks of the lady who was trying to appear asleep, and howled hysterically as she bounded out of bed with a cry of pain.

"Go, both of you, and get Mustafa to prepare my morning meal and coffee!" he chuckled. "And tell Hassan to make sure the house is clean! Today your mistress returns, and I want the place to look presentable? He snickered nastily as the two

women quickly gathered their night clothes, bowed, and left.

Ah, what a great day this was going to be, thought Suleman. His chubby, ringed fingers reached into the box of sweetmeats that was always at his bedside, and he plopped a few into his mouth. Chewing thoughtfully, he considered himself lucky. The story had worked, and the faris was returning with Fatira and Afta in chains, no less! Oh, how sweet his vengeance would be. Licking his fingers clean, the merchant poked his other hand into the box, grabbed another fistful of snacks, and then lumbered off to the eating room. May as well start with a good breakfast, he thought. Then we will receive the faris, get the veil, and pay him off. And finally, to top the day off, we will have some real private quality time underground with his beloved (he smiled as his mind lingered on that description) wife. The rivers of Zakhara would turn to ice before she ever got close to her veil again.

As his spies had said, the faris arrived a few hours later, with wife and daughter chained securely, their veils removed, and looking quite drugged. They were escorted into the courtyard where Suleman was enjoying his midmorning snack of glazed duck, honeyed artichoke hearts, and sweetened coffee.

"Ah, Mufti al Kaban, exalted faris of the land, I welcome you!" cried the merchant, not bothering to get up from his comfortable, pillowed lair, where he was being fanned by an attractive, lithe, dark-haired girl. "Come, sit, and enjoy a few delicacies I've saved for such an occasion. We must share salt and celebrate your success!"

"My thanks, Suleman," replied Mufti, "but I must get to my next mission quickly, and I would just as soon receive my reward and be on my way."

"Of course, of course," cried the merchant enthusiastically, gnawing the last morsel of meat from a duck leg, "but really, first let me hear of your success! Did you destroy the genie? Where did you find them?"

Mufti sighed. This was not going to be easy. "Very well, you deserve to hear the story, but first I should like to be paid," insisted the faris.

Suleman chuckled, then choked briefly on an artichoke heart. Coughing and laughing, he said, "Really, Mufti, you sound more like a beggar from the bazaar than a holy warrior! But you deserve it as much as I deserve to hear about the story. Oh, where is the veil?"

The faris produced the feathered garment and handed it over, and Suleman took it, stuck it in a pouch, and rubbed his hands with glee as his eyes gleamed triumphantly. Then he pulled a jingling sack from behind a pillow and tossed it to Mufti. Finally, he cleared his mouth with a swallow of coffee and spit it out over his shoulder. It splattered right on the feet of the girl with the fan, and she did not flinch.

Mufti looked inside the sack, but did not bother to count the dinars. It did not matter. The contract was completed. And now he could deal with this pig.

He sat down cross-legged in front of Suleman and stated dryly, "I don't know why you are inquiring about a genie. There was none."

"Hah! I knew it!" the merchant exclaimed. "Once the genie saw you, Mufti al Kaban, renowned faris warrior, coming after him, I knew he would flee! Lucky for him, too. But oh yes, there was a genie, don't you recall it left a note?" the merchant added.

Mufti's voice was cold: "The only luck involved was that your wife saved my life from a pack of hyena-men who happened to come to the same oasis where I caught up with her."

Suleman stopped eating, and looked at the faris carefully. "Truly? Well, perhaps she did so to defend herself and the child. Hmmm. Well, no matter, I am glad you are safe, and that you captured her. I see you drugged her as I instructed, and that is good, too. Well, uh, I am sure the genie left once it saw you. Perhaps Afta will remember something once the potion wears off and will let me know. Here, let me give you this as a bonus for your trouble and let you be on your way," he said, taking a jeweled ring off one of his fingers.

"No, that's quite all right, Suleman," Mufti said, holding up his hand, signaling refusal. "In a way, I am already on my next mission."

"What?" asked the merchant stupidly.

"After she saved me, Afta told me the most incredible story. She indicated that she was a slave to her husband who had power over her by keeping her veil, the one I have just given back to you. She also said that as long as the veil was parted from her, the holder became her master. And she said that her current master, you, Suleman, inflicted atrocities upon her and her daughter too unmentionable to name."

"That is none of your business, faris!" roared Suleman, waddling from the couch, and shaking his finger. "You agreed to this mission and swore your word to accomplish it! Nothing can change that! Now, get out!"

"That is exactly what I told her, Suleman," replied Mufti soothingly, holding his hands open while remaining seated. "Even though she had saved my life, even though she nursed me and my wounded mount back to health, and regardless of the fact that her husband might be cruel and inhumane, I advised her that I could not be broken from my oath."

Suleman relaxed a little, and nodded. "Good. Then we are agreed that what happens in a man's house is his own business. Well, you may be on your way."

"Well, if you please, remain," the warrior stated flatly. "You insisted on hearing the story so I shall finish it. I did not believe her until I put the pieces together. There was no genie, there never was. The note

was a hoax, similar to the tricks you perform on your competitors, and I remember you had me dine with you when we first talked. It is apparent to me now that you probably put something into my drink or my food to get me to believe such an incredible tale. Once I had agreed to the mission and given my word to complete it, you knew that something like this could happen. Thus, you gave me a potion to keep her and her daughter drugged."

"Yes," grinned Suleman, "but she is my wife, and an oath is an oath, whether by contract or by marriage. We have no further need for your services, faris, so if you please?" and he pointed toward the back door that led to the alley.

"Of course," Mufti stated, and he got up to leave, but then added, "but I did make an oath to her as well that you need to know about. I promised her that upon completion of my contract to you that I would ask that you release her from the vows of the marriage you have forced upon her by possession of this veil, and I do so now. You know that she is not only a creature of the wild, but a caring person who ministers to the land and its people. Her knowledge is great, and her ability to render assistance is considerable. Why keep her in this gilded cage when her knowledge and learning could be shared with the people? Please, Suleman, go to the qadi with her and declare that this marriage should be dissolved. She will agree readily and it will be done. You will have done a great service to her, yourself, and the Land. She will want none of your property. What say you?"

Suleman laughed heartily and long. He fell back on his pillowed couch and it creaked dangerously. Tears came to his eyes and he slapped his fat knees. Then he sat up and cried, "You self-righteous donkey! She is mine, I captured her fairly, I married her legally, and that is that! You have kept her promise to her. You asked me to release her, I refused, and that is the end of that! Now get out before I summon the mamluks to remove you from the city!"

"That is your final answer?" asked Mufti gently. "There is nothing I can say or do to change your mind?"

"No, now go!" shrieked Suleman.

"Very well," shrugged the faris, and he took the bag of money, and turned to leave, leaving the helplessly drugged wife and daughter standing there.

And as he did so, his hand slipped inside his aba and removed a dagger from a bandolier. A moment later, he whirled around, and a dagger with a sunburst on the blade hissed through the air of the courtyard.

"Tell me, grandson, do you think this was all really worth it?"

"Yes, grandfather," replied Mufti. "You will find this document in order. It deeds the household and all of the goods of Suleman al Fataq from his widow to our

servant, Anwar. What we have gained far outweighs the loss. We have needed such a place for some time."

The old man brushed aside the document, then asked, "But, grandson, what of the woman and her child? Were they really drugged?"

"Yes, grandfather, they were. It was hard to convince her to allow it, but by the time we had left the oasis, we were firmly agreed that she had to have her freedom and that I had to fulfill my oath. It was the only way to accomplish our goals without both of us losing our honor. I trusted her fully, and once I convinced her that I was a holy warrior and told her of my training, she gave me her trust. Without drugging her, we might have been discovered by a sorcerer or hakima hired by the fat one."

"And where did the mother and child go?" asked the old man.

"Off to the mountains,"⁸ replied Mufti. "She said that she had to take her daughter to receive training in the ways of her kind. I offered to accompany and guard them on their journey, but she refused, as I knew she would. Ah, what a wonderfully independent creature!"

"Independence!" snorted the grandfather. "If Kor could reveal total knowledge to me, I suspect the Old One would tell me that my grandson's lust for independence, especially being freed from keeping the garb of a faris, was the real motivation behind this incident!"

Mufti smiled. "Oh exalted one, I believe Kor speaks through your lips as he has for many years. Yes, being a faris was getting tiresome. Please tell me that I do not have to continue."

"Hah! You made your own wish come true, did you not? The city is still in an uproar over the killing of the fat toad and his six guards by a faris! How could you pose as one now? Mufti al Kaban will be searched for by mercenaries and bounty hunters all the way to the Isle of the Elephant."

"Ah, you are wise, grandfather," cooed Mufti.

"And you are impudent! But," he added with softness in his voice, "you are one of our best, and it is indeed time for a change. I think you should learn to cut hair and trim beards. There are certain people in Huzuz we want to keep track of, those who seem to be, well, unfriendly to the scholars of Kor's mosque for reasons yet to be divined. Are you interested?"

"Exalted one, I am yours to command," replied Mufti, bowing.

"Very well, go out and talk to Latifa. She will teach you the ways of the barber and brief you on your new background and mission. May the knowledge of the Old One protect you on this, your new life."

"Yes, grandfather," replied Mufti, bowing again, and he left the tent.

The old man laid back on the pillows in his tent and looked at the deed again. Justice had been done and there would probably be a day when the bird maiden

could be called upon to return a favor. And what a wonderful home Mufti had procured. Posing as a faris for five long years, he had brought in much useful information. It would be interesting to see how well he would do in the Grand Bazaar of Huzuz posing as an enterprising barber. As a faris, Mufti had to rely on his brawn and fighting skills. This new role would require a lot more wits. If he did well, it would probably be time to consider even greater things for him among the Wrath of the Old. Yes, with followers such as Mufti, the future of the Order always would be bright with the blood of those who opposed it.

The Grandfather of Assassins smiled happily, looked at the deed again, and reached for a pear.

Notes

1. The bird maiden is a creature unique to Zakhara, the Land of Fate. It is always female, just like the swanmay living in the northern lands of Toril, and in some respects quite similar to that creature.

Like a swanmay, a bird maiden may *shapechange* to bird form. While the former can transform only into a swan, the bird maiden can change into a variety of bird forms, depending upon her level.

It is important to note that as the bird maiden rises in level, she may elect to take the form for that level or any form of a lesser level. For example, a 6th-level bird maiden could *shapechange* into an owl or any bird form allowed for a 2nd- through 5th-level bird maiden.

There are other differences between swanmays and bird maidens. A swanmay is a ranger while in human form, while a bird maiden is a kahina, with all of the powers of that class (See *Arabian Adventures*). Another important difference is that swanmays are always good-aligned, while a bird maiden may be of any alignment. Most bird maidens (80%) are of neutral alignment, while 10% are good and 10% are evil. Whatever the alignment, it always has a neutral tendency (i.e., neutral good, true neutral, or neutral evil). It is rumored that evil bird maidens are able to *shapechange* into ravens, blood hawks, and giant vultures.

2. Good and neutral bird maidens see themselves as protectors of living things and guard against those who would despoil the land. Hence, they have a tendency to help and teach those who respect the land. Their protection applies to sentient beings as well, in line with the tolerance extended to all by the teachings of the Loregiver. Hence, a bird maiden would teach irrigation to farmers to help their crops grow, but she would ensure that the system would not harm the lake or river life being used as a water source.

3. The power of a bird maiden resides in a shawl, veil, or other significant object of clothing that is made of feathers. This

Continued on page 94

me, to thank him for giving me a life. There was so much I wanted to say.

But as these words stuck in my throat, a memory wedged its way in. I remembered my youthful anticipation as I would wait in the castle for his return from distant lands, the warm look on his face as he burst through the doorway, and the smell of the woods on his hands and clothes when he greeted me with hugs of the same fervor as those he had for Averett and Kile.

What would my life have been without Davrin? Where would I have been without Lorien?

I gazed at him. His head shook with more than the cold. His lips were dry and creased, showing no signs of having been treated with the oils that Lorien would have made him apply. His hair blew about his uncovered head.

A new thought managed to struggle through my own selfish concerns. One so disturbing that it caught my breath and drew me harshly back into reality.

Davrin had never been alone before.

"When are you leaving?" he asked.

I swallowed and cleared my throat. There was only one answer to this question. My time of leaving would come when Davrin's came, and this was not it. "I am not ready yet."

He grimaced. "I have nothing more for you, Garrett. You should go and live your life. Leave an old man in peace."

"No, I disagree. There is much more I can learn from you."

Davrin pursed his lips.

I walked to his chair and knelt beside him, warming his cold hand in mine. "I'll make our breakfast in a moment. But first, tell me about when you first met Lorien."

He sat in silence for a moment, staring at the cliffs. Then he began to speak. As he described their first meeting, the sun crested the far ridge of the canyon. I raised my free hand and shielded my eyes, squinting into the light of a new day.

Bird Maiden

Continued from page 80

object is given to her at the end of her initial training. If she ever loses it, she loses all her powers as kahina and shape-changer until she recovers it. Unscrupulous men have been known to come into the possession of a bird maiden's feathered garment, and with the creature helpless, have forced her into marriage.

4. Destruction of the feathered token of the bird maiden always results in the creature's death with no hope whatsoever of resurrection.

5. When *shapechanged*, only a bird maiden's feathered garment and her body

transform. All other worldly goods must be taken off and guarded by someone else.

6. Just as mystics dance, bird maiden kahinas sing, and the verbal components of their spells are always sung in a sweet, warbling voice. They have major access to the spheres of All, Animal, Divination, Elemental, Healing, Plant, and Weather. They have minor access to the spheres of Creation, Protection, and Sun.

7. While bird maidens always have the nonweapon proficiency options allowed to kahinas, one proficiency they always possess is herbalism due to its connection with the land they are sworn to protect.

8. The place of training for bird maidens is said to be a place called the Crown of All Feathers. It is supposedly a great wooden fortress concealed among the clouds in high hills or mountains. There aarakocra teach the rituals, duties, and abilities of the bird maidens. It is rumored that a very special genie of enormous power guards this place and uses powerful illusions to keep it safe from the curious and unsavory. All bird maidens know where this place is, but no sort of magical compulsion or physical abuse can pry the location from them.

Slimy, Yet Deadly

By Johnathan Richards

Artwork by Terry Dysktra

The creature spasmed and quivered in the ebony darkness of the cavern interior. Readjusting to its new form, it pulled itself together into a central mass. Had it any eyes, it would perhaps be able to see an identical creature a mere two feet away, undergoing a similar process. Each was a glistening mass of black protoplasm, roughly three feet in diameter.

Blind as it was, it could nonetheless sense the heat of its nearby companion, but disregarded it as not-food, and began oozing and slithering its way across the cavern, away from its twin. Gradually, the other creature faded out of range of its heat sense. It crawled onward, ever onward, in search of food.

Ahead, the steady dripping of water alerted passersby of the presence of an underground pool. The creature headed toward it, but not because of the telltale dripping sound—in fact, the creature was stone deaf, and the concept of sound was foreign to it. No, instead, its eerie ability to sense heat and analyze patterns identified the pool as that type of not-food that often has food inside of it. Without hesitation, the creature flowed into the water, seeking prey.

The pool was not deep, only two feet or so, but that was deep enough to hold a dozen tiny cave fish, white and blind and darting back and forth in the cold, clear water. The creature instinctively altered its shape, spreading itself out in two directions, forming a wall that closed around the fish like a net. As they came in contact with the jet-black creature, the fish immediately began to dissolve, as tiny mouths all over the creature's body ate them away. When all the fish were devoured, the creature moved on, leaving the shallow, lifeless pool and continuing on its random journey.

Several minutes later, the creature's travels brought it into a cavernous chamber, hundreds of feet in diameter, with stalactites reaching down from the ceiling and merging into the stalagmites growing up from the floor. The chamber was home to hundreds of bats, hanging upside-down from perches on the ceiling. To the flowing creature's heat senses, it seemed as if it had just entered the open fields of the

surface world at night, with countless points of fire burning overhead. However, the stars were forever out of reach; the bats were not.

Without slowing for an instant, the creature flowed up a huge pillar formed by the meeting of stalactite and stalagmite. It spiraled its way up the pillar, and, upon reaching the top, flowed just as effortlessly along the ceiling, winding its way around jagged protuberances, straight toward the nearest sleeping bat. The bats had no warning, for the creature made no noise as it flowed up and over them, engulfing the small mammals with its syrupy body.

How long the creature spent on the ceiling gobbling up bats it neither knew nor cared, for it was simply going about its normal routine: finding food, eating food, finding more food. This was the sum of its existence, its reason for being. Eventually, the bats flew off, though whether

they were somehow alerted to its presence or their sleep was over and it was time to hunt, it mattered not to the creature. The food was simply gone; more food would have to be found.

It didn't take long. Dimly, at the edge of its perception, the creature sensed a tiny movement in the heat-patterns of the cavern below. A spider, barely an inch across, was making its erratic way across the cave floor. Size didn't matter to the ebony creature above; food was food, and this was the nearest. It dropped to the floor below and flowed over the spider, dissolving it instantly.

Its latest meal finished, the creature flowed in a random direction, looking for more.

"Do you really think we should go much further?" Shandrilla asked. She swung her lantern around, casting eerie shadows along the cavern walls, and shivered involuntarily. "I'd hate to get lost in here."

"Just a little further", insisted Javorik, her gnome companion. "I want to see what's ahead." He hummed softly to himself, happily and not quite in key. The dangers of the Underdark held no terror for him; after all, was he not Javorik the Bold, Illusionist Extraordinaire, Wielder of the Wand of Lightning, Slayer of Lizards, Tamer of Rats? So far, this underground exploration stuff was a cakewalk.

"Okay," Shandrilla replied, with a frown. "But not too much further, huh?" She didn't like it this far underground. She kept seeing movement at the edge of her vision, and even though her mind knew it was just a trick of the light, her gut kept telling her otherwise. She kept a firm grip on the lantern with her left hand, and an even firmer grip on the short sword in her right.

"Ooh, ooh, hey!" squealed Javorik in delight, as he ran ahead. "Look at this!" Shandrilla hurried to catch up, and found the gnome kneeling next to a clump of orange fungus, shoveling the mushrooms into a sack with his little dagger. "I was right, I was right, see? I was right! Squimmerall! I knew we could find some down here!"

"You were right, all right. Can we go now?"

"Just a little further. There might be more!" And he toddled off further into the depths of the Underdark. Shandrilla hurried to keep up.

The creature oozed over a rock formation, and found the corpse of a kobold, an arrow stuck in its back. The little humanoid was long dead; the coal-black creature sensed no heat from the body. However, heat or no heat, its senses could tell that its find was composed of once-living tissue, and it oozed toward the kobold without delay

The kobold wore a chain mail vest over ragged leather garments. Neither had been protection enough from the arrow that extinguished its life; neither provided much protection now from the creature devouring its body The night-black ooze flowed over the kobold, eating its way through armor, clothing, flesh and bone alike.

"C'mon, Javorik, enough's enough already. Let's go back."

"What, frightened? A big, strong human like you? Nonsense! What's to be afraid of, down here? Some bats? A patch of squimmerall? That's all we've seen so far. Nothing to be afraid of."

"Yeah, well, I've heard stories . . ."

"Stories? Stories of what?"

"You know. Drow. Snirf goblins."

"Snirf goblins?" He scratched his head. "Svirfnebli, you mean? Pah. Don't exist. Fairy stories. Evil gnomes, indeed. Come on, let's go down this way."

Shandrilla let out a sigh of exasperation and followed her diminutive companion.

The creature made short work of the kobold, and moved on. It was noticeably larger than it had been when it first split off from its twin, however long ago that was. Since that time, it had consumed its own weight in fish, bats, spider, and decaying kobold. Other than taking the time to feed, it had been on the move constantly. Now was no exception; it had finished its meal, and it was time to find another one.

Javorik let out another squeak of delight as they rounded a corner and found another patch of the orange fungus. "See, didn't I say? Didn't I?" he asked, as he squatted and untied the sack attached to his belt. "This stuff is great. You can use it in all types of potions. Good substitute component for a few spells, too, I think. And it tastes good in tea, eh? Ever have squimmerall tea, Shanny?"

"Huh? No." Shandrilla was looking in all directions at once again, her eyes interpreting the flickering shadows as the movements of malevolent creatures, just out of sight. "Can we go now, Javorik? Please?"

"Hey, hold that light steady, will you? I'm almost done here." He continued picking the odd-looking fungus growths and stuffing them into his sack, which was beginning to tug comically on his belt.

Shandrilla was suddenly aware of the devastatingly huge volume of rock all around her, and shivered again. She didn't like being so far underground—it was like being buried already. Still, Javorik didn't seem to mind, but then he was a gnome, wasn't he? Sure, he was raised in a gnomish village on the surface, and he spent most of his time in dusty libraries, but all the same. Spelunking was normal for gnomes, even if this was his first time in the Underdark, as it was hers. She'd just be glad to see the light of the sun again, and soon.

"Almost done," said the little gnome, fidgeting with the tie-string on the sack. It couldn't possibly hang from his belt now, not if he wanted to keep his pants up. Over the shoulder was probably the way to go. Better hurry, too, before that silly human girl worried herself to death over flickering shadows. "There," he said at last. "All set. Let's go."

Which he followed almost immediately with a "Hello, what's this?"

As the creature followed the underground passage, it came to a dead end, where the ceiling collapsed some time ago. The way was impossible to most, but not to the amorphous, raven-black creature that now flowed up the pile of rocks, then oozed through the narrowest of cracks and crevices, winding above some stones and under others, tracing a path that the most nimble of mice would have a hard time following. After 30 feet of this, the creature found itself in an open passage-way again and continued on its journey

The passageway twisted back and forth, and the creature followed its path, deviating only to crawl up to the ceiling to engulf a lizard it sensed scampering up the wall. It continued its winding journey on the ceiling for a while, before dropping onto an unsuspecting beetle it noticed with its heat sense. Then it turned another corner, and immediately sensed two more sources of food. Homing in on them, it flowed silently across the floor toward the two.

"What is it?" asked the human, nervously.

"I've no idea," replied Javorik. "Looks kind of like oil, doesn't it?"

"It's heading our way. Let's get out of here."

"Wait a minute, I think it's alive. Go poke it with your sword, see what it does."

"Go poke it yourself, gnome."

"Pah, I'll do better than that. Am I not Javorik the Illusionist, Wielder of the Wand of Lightning? Stand back, foul glop, or face the wrath of Mighty Javorik." The gnome set down his sack and fumbled at his belt, pulling out a slender wand, and aimed it at the approaching blob of darkness.

"Javorik . . ."

"Take that!" A sizzling flash of lightning bolted across the room, neatly slicing the creature in half. The gnome saw the two small blobs where once there had been but one, and smiled to himself. Cut the thing in two, he thought. Have to add Slayer of Oozing Menaces to my title.

Then the two blobs started to move, and his smile collapsed to a frown.

Each of the two creatures seemed to have picked a different target. While one oozed over to the gnome, the other was making its way toward Shandrilla. "Your ring!" yelled Javorik, and started a spell. This creature lives in total darkness, he thought. Let's see what a continual light spell does to it.

"Ring, right," said the human, mentally invoking the power of the ring her gnome friend had given her for added protection. As the illusionist finished his spell and the cavern lit up with the power of the light he had summoned, Shandrilla faded from view.

Neither ploy worked. While one creature seemed unaffected by the fact that it was now casting the light of a sunny day into the chamber, the other followed Shandrilla's invisible figure wherever she went.

So much for sneaking up behind it, thought the thief. Although, really, who's to say I'd even know when I was behind it? Kind of hard to tell when your opponent's a blob of goo. She raised her sword arm, preparing for a downward swing into the thing with her full weight behind it. Just as her sword started its downward arc, Shandrilla's invisible form popped back into view and her companion cried out.

"No! Don't hit it!"

Shandrilla twisted, yanking her sword to the side, missing the creature by a hair's breadth. The awkward movement sent

her spinning, and she fell forward. Instinctively, she threw her right foot in front of her to keep her balance—it landed on, and sank into, the creature's pliant body. Immediately, a sensation of heat pervaded her foot.

"A pudding! We're fighting a pudding!" yelled the gnome from across the chamber. "Federico told me about these things once; if you hit them, they split in two."

"Great, so we can't hit them," said Shandrilla, tugging her foot out of the evil-looking blob of darkness. The thing had been flowing up her leg, and her leather boot was already half-dissolved from the brief contact it had with the creature. "What can we do? How did Federico kill his?"

"Uh, he didn't, not that I recall," muttered the gnome. "Think he ran away from it after he split it into about six pieces." Javorik was getting winded, running back and forth away from the glowing blob, while simultaneously trying to remember his cousin's description of his battle with the pudding years ago, racking his brain for a good spell to use against these ones, and fumbling through his pockets for a weapon that might do some good.

"Sounds good to me," said the thief. "Let's go!"

Unfortunately, the two creatures blocked the way back to the surface, though whether they did so by accident or design it was hard to tell. One oozed its way to the gnome's sack of orange fungus and began absorbing it.

"Stand back, let me try something," the little gnome said, reaching into a pocket for the right material components and starting the words to a spell. At the spell's completion, a gaping hole appeared in front of the two adventurers, a jagged gash in the cavern floor that wasn't there a second ago, stretching across the chamber from one wall to the other. From the looks of it, it was at least 50 feet deep. "That should hold them a bit," he said.

It didn't. Without a moment's hesitation, both creatures oozed over the edge of the crevasse and continued across, seemingly floating over the pit until they reached the other side.

"Hmph," snorted Javorik. "So much for illusions."

As the two ink-black creatures flowed over the illusory pit, Javorik and Shandrilla had nowhere to go but deeper into the Underdark, the way the original creature had come. The cavern narrowed to a width of about six or seven feet, too narrow to risk a dash past the amorphous beings. So deeper they went, Shandrilla leading the way, her human legs taking her further with each hurried stride than Javorik's, who struggled to keep up and kept glancing nervously over his shoulder at their unrelenting pursuers. The passageway twisted back and forth, and Shandrilla kept praying for a forking path where they might lose the dark blobs so intent on making the two

adventurers their next meal.

Then they turned a corner and found the way blocked by a pile of rocks, caused by a cave-in some time ago. Javorik summed up their situation in two short syllables.

"Uh-oh."

Onward the two creatures flowed, onward toward the fleeing food. Each entity was aware of the other, but discounted it as irrelevant nonfood. All that mattered was that food was nearby, food that must be pursued and devoured. While the taller of the two foods was faster than the creatures, it kept slowing down and waiting for the smaller food to catch up. Better yet, the smaller food was starting to slow down. Soon, very soon, the creatures would overcome the small food and devour it.

The two adventurers scrambled up the pile of rocks, hoping in vain to find some way over the top. They frantically explored each edge of the rock barrier, to no avail. Shandrilla felt panic closing in; never before had she been more aware of the enormous quantity of solid stone all around her. Bad enough to be buried alive under tons of rock, but to be devoured by some slimy horror from the bowels of the earth . . .

"Close your lantern," suggested Javorik. "Maybe they can track our light."

"I doubt that."

"So do I, but do you have any better ideas? Maybe they'll go away if they can't see us."

Reluctantly, Shandrilla closed the lid on her lantern, plunging the passageway into total darkness. The two waited in silence, and before long, Shandrilla's eyes picked up the faintest glimmerings of light from around the bend. It was the creature lit by Javorik's light spell, she knew. The light grew brighter, and then from around the bend flowed the glowing creature. Without hesitation, it headed straight for the pile of rocks and began oozing its way up, toward the two adventurers.

"No, no, no!" screamed the thief, and started flinging rocks at the approaching monster. She kicked with her feet, simultaneously trying to get as far away from it as possible and knock loose stones down on the vile thing. Several rocks hit the creature, but none struck with enough force to split it in two. However, perhaps sensing an easier approach, the pudding began to ooze between the rocks in the pile, gradually slipping further in until it was no longer visible. As it submerged into the pile, the spell's radiance vanished with it.

"The other one! Where's the other one?" cried Javorik. "Quick, the lantern!"

Shandrilla fumbled with the lantern's lid and finally got it open. She swung its beam across the pile of rocks, down on the floor below, back and forth. Nothing.

Then a burst of light erupted beneath them, and they saw a dark form oozing up through the very rocks on which they were perched. Both adventurers screamed

and rolled to the side, the gnome to the left, the human to the right. It was an instinctive response, and one that saved their lives, for at the same moment the other creature dropped from the ceiling onto the spot they had occupied a mere second before.

Shandrilla felt her footing give way, and arms flailing, fell backward off the pile of stones. She lost both sword and lantern on the way down and landed in a heap on the floor at the foot of the pile. She struck her head hard, and the world spun dizzily around her.

Then she felt hands gripping her arm, tugging her up. It was Javorik, face flushed and grimy in the flickering light. He was saying something, but it wasn't registering.

"Shanny? Come on, get up, we gotta go. Shanny, come on, we gotta get going."

Flickering light? Shandrilla sat up, got to her knees, thought about standing up, decided to wait. Anyway, at this height, she could look her companion in the eyes, and make intelligent conversation.

"Huh?"

"You did it, Shanny! The lantern hit that bugger square on! Thing went up like kindling. I don't know about the other one, though, so, if you're ready to go . . ."

Shandrilla staggered to her feet and looked up at the pile of rocks. A small fire was burning at the top. Almost as if on cue, shafts of light began streaming out of the rocks near the bottom of the pile. The glowing creature was oozing out between the cracks.

"Let's get out of here," said the thief.

"Let's," agreed the illusionist. Together, they staggered down the corridor. As they rounded the bend, Shandrilla realized that their only source of light was gone, burning on the rocks. Javorik sensed her unease. "I can guide us, Shanny. Infravision. No problem. And I promise, no stopping for squimmerall."

For the first time in what seemed like a long while, the beginnings of a smile appeared on the young thief's lips. "Deal."

The creature flowed out of the rock pile, still glowing from the effects of the gnome's spell. At the very edge of its awareness, it felt the two foods moving away. Reorganizing its mass, it sped along the twisting corridor, in pursuit.

"Almost halfway there. I think next time, we'll bring torches."

"Next time? There is no next time, gnome."

"No next time? That's no way to talk, human. Especially not now that you're Shandrilla, Slayer of Pudding."

"Sometimes I think you're Javorik, Brain of Pudding."

"You wound me."

"Seriously, gnome. Do you think that other one'll follow us to the surface?"

"Hard to say. I doubt it. I never heard of one above ground. I'll have to ask Federico."

"So once we make it back topside, we should be home free."

"Should be. We'll let this bugger skulk around down here to his little heart's content. And good luck trying to sneak up on anybody when he's glowing like a bright summer day."

"Who knows, Javorik? You might have created a new species. 'Javorik's Glowing Pudding.'"

"Sounds more like a recipe."

"Maybe you're right."

Silently, the glowing creature stalked the two adventurers. It sensed the presence of food, and so it would follow the food until it overcame it and fed. Nothing would stop it from repeating its endless cycle.

And then it became aware of a different food on the ceiling above it. A lizard was trying to scamper out of range of the light. The glowing creature changed direction, heading for the nearest wall and flowing up onto the ceiling. The lizard scurried off, but it was slower than the swiftly-flowing abomination. Before long, the little reptile had been dissolved.

Its meal finished, the glowing creature cast its senses forth in all directions. There was no food within range. Moving off in a random direction, it set out to find some.

Ω

Notes:

1. The black pudding can live underwater, as it can extract oxygen from water as easily as it can from air. However, water dampens its senses and its movement rate, halving them both. Thus, it can sense heat variations up to 45' away, and move at a rate of 3 while underwater. The pudding cannot swim or float but must flow along the bottom of the body of water.

Obviously, while underwater, the pudding is immune to fire, and one might think that it would adopt this environment for that very reason. However, water also dilutes its acid attack, reducing its damage per attack to 1d6 instead of 3d6. Once out of water, it takes two rounds to restore each die of damage: thus, after two rounds, it does 2d6 hp damage with each attack, and only after four rounds is it back to full damage.

2. The black pudding moves silently at all times, in a steady flowing motion, over any solid surface. The black pudding's movement can perhaps best be likened to that of a rolling ball of clay, if the clay were softened to an almost-liquid state, so that it hugged the floor as it rolled. The pudding can alter its shape and can also move snakelike in a long, thin mass; its soft, pliable body is equally silent when it moves in this manner. In fact, a black pudding can flow over a stone floor strewn with autumn leaves without making a single leaf crunch (it dissolves the leaves as it engulfs them).

3. A blow from a weapon divides a black pudding into two smaller puddings, each with half of the original pudding's hit points, but each able to attack as the original. This is because the blow strikes the pudding's soft body and sends it flowing away from the weapon in all directions, which invariably splits the pudding into two or more sections. Once this separation occurs, each piece of the pudding is a separate being, unable to merge into one being.

However, the stress from a weapon strike is largely due to its being unanticipated. When the blow lands, it takes the pudding by surprise; it cannot prepare for or prevent its separation into two or more entities. By contrast, the black pudding can drop from above and land on the floor without splitting. There are two reasons for this. First of all, it knows exactly what's coming, and what to expect, as it's doing it itself. Second, it's being "struck" by the floor, along its entire length, and this flattens the creature out but does not send it flying in two different directions.

4. A black pudding's senses extend a full 90' in all directions from its body. Within this area, it can distinguish the structural composition of its surroundings. While this sense is not fine-tuned enough to distinguish between different types of creatures, the pudding is aware of any animal or

vegetable tissue in its range of awareness.

Furthermore, it can tell whether the organic material is living or dead (not that this makes any difference whatsoever to the pudding's eating habits). Once a black pudding is aware of a living creature, it will immediately approach this food and attempt to eat it, stopping at nothing to do so (puddings never check morale, and they always fight to the death).

5. Black puddings destroy chain mail in one round, and plate mail in two. This is because the links of chain mail allow the creature to flow through the armor and devour it from all sides simultaneously, whereas plate mail presents a continuous solid surface, and the pudding must dissolve it from one side only. Dissolving weapons works the same way: a sword poked into a pudding can be dissolved from all sides, so it takes the pudding one round, whereas a sword left flat on the ground takes a pudding two rounds to dissolve. Each magical plus of the weapon or armor adds one round to the time required to dissolve it.

6. Puddings range in size from 3' to 8' in diameter. As they eat, they gradually get bigger. Of course, the rate of growth depends on the availability of food, but, regardless of how quickly it reaches reproductive size, the pudding will reproduce by fission at some time after reaching 6' in diameter, and before reaching 9'. Puddings splitting voluntarily (as opposed to as a result of being struck by a weapon or lightning) always form two equally-sized smaller puddings, each with half of the hit points of the parent pudding.

7. Black puddings do not need to sleep, a fact which gives them a distinct advantage over their prey, which usually does.

8. Black puddings are immune to damage from all forms of electricity, including lightning. However, although a lightning bolt causes no damage to the black pudding's body, it does cause an involuntary convulsive reaction that splits the pudding in two, regardless of the pudding's size. Lesser forms of electrical attack, such as a shocking grasp spell, cause a weaker convulsive spasm in the pudding, but this is not strong enough to split it.

9. Because black puddings have no sense of sight, they cannot be affected by sight-based spells. They cannot be blinded by *light* or *continual light* spells, and *invisibility* cannot mask a creature's presence from the pudding's heat sense; its heat sense is not a form of vision.

10. Since puddings neither see nor hear, they are completely immune to all illusions with visual or auditory effects. In addition, their blindness makes them immune to such sight-based attacks as a medusa's gaze, and their deafness makes them immune to such sound-based attacks as the roar of an androsphinx.

Puddings are also immune to all forms of acid. Their acid dissolves webs (both natural and magical) without slowing their movement rate. Finally, their odd metabolism allows them to ignore the effects of poison and cold. The latter ability is especially true of the white pudding, which thrives in arctic lands.

11. Since black puddings are immune to all forms of acid, including their own, one pudding cannot eat another. Furthermore, they are asexual, and do not need to interact with another in order to reproduce. Therefore, puddings generally ignore the existence of others of their kind. If no food is within range, two puddings in the same location will generally go separate ways instinctively; if there is food in the vicinity, each immediately heads toward it.

12. Black puddings tend to remain underground and out of sunlight for a good reason: their dark coloration absorbs heat a bit too well, and dries them out after about one day's exposure. This is true only of the black pudding; the white, dun, and brown varieties of pudding have all adapted to life on the surface. Note that black puddings take no damage from being briefly exposed to sunlight, nor do spells such as *sunray* harm them.

13. Puddings are nonintelligent, and so always head for the nearest food (animal or vegetable) available. Adventurers not willing (or able) to battle a pudding can usually escape a pudding by throwing some food its way and hightailing it in the opposite direction.

Bugbear

“A creak from the porch steps and a hulking shadow flits across the windowpane. In the barn, the animals grow restless. They sense something in the dark. Inside, the family members sleep deep, coddled by their dreams, not realizing a nightmare stalks their home. A creature—all shaggy fur and murder—waits in the closet, under the bed, behind the windblown curtains. It will burn your barn and feast on your livestock, ruin your home and eat your sweet meats. A bugbear does not merely kill. It takes everything from a victim, shredding his sanity with the worst of his fears and nightmares.”

—Euward Carnaby,
Things in the Darkness

There are things that go bump in the night, and many of them are bugbears. These shaggy cousins of goblins are larger, stronger, and far crueler, and spend most of their days seeking out civilized folk to frighten and slaughter. For the bugbear, acts of terror are the only joys they seek, drawing grim satisfaction in the horror of others.

Overview

Bugbears are the things in the dark. They are the monsters in your child's closet, tormenting him but avoiding detection when you wrench open the door. They hide beneath your window in the night, listening to you sleep, soaking up your nightmares. Fear of the night is universal among humankind, and bugbears are the truth to this fear. They feed on terror with an appetite no mortal man could ever understand. It is more satiating than food, more intoxicating than any drug, even more satisfying than the companionship of their own kin. Bugbears stalk mankind to satiate an urge more demanding than any other. The scent of fear drives them.

A victim's face aghast with horror as the bugbears emerge from the shadows is the only true joy they know.

Bugbears are hunters by nature, although instead of seeking food or glory, they only desire terror. Nothing but fear slakes this need, and every bugbear spends its life a slave to the hunger. Their addiction is our terror, as they prowl the shadows every night hunting man, woman, and child. They are stealthy and delight in giving away their presence to a victim slowly—at first in creaks or thumps in the night their prey can easily dismiss as the wind, next in an open window the person doesn't remember leaving ajar. The bugbear engages in a slow-building dance of innocuous noises and clues to raise the victim's hackles and draw out the scent of the victim's rising terror.

Bugbears care nothing for order, have no conception of ethics or morals, and discard family and traditions as mere obstacles to the hunt. What few trappings of civilization they carry are actually little more than mementos of particularly terror-filled nights of hunting, which they long to remember again and again. They take ears as trophies, but only when the night's sport proved particularly satisfying. On dismal nights when no prey is at hand, bugbears hold their necklaces of ears close and do their best to summon the memory of succulent fear-scent gifted to them by those dying victims.

Ecology

Bugbears are squat, ugly creatures, standing as tall as a man when upright, although preferring to hunch and skulk. They are strong, thick-shouldered louts, and their dark bushy fur hides rippling muscles and a hulking skeletal structure. Although comparable in height to humans, they outweigh humans of their height by a good 30 pounds. Bugbears are surprisingly light-footed for such beefy creatures, capable of navigating creaky old wood floors as carefully and quietly as beings half their size.

Bugbear eyes are frighteningly large—these alien-looking giant ovals on the sides of their heads lack of pupils, which only make the eyes seem even bigger. Their teeth are made for eating the raw meat of fresh kills. These needle-like sawing blades gnash and rend tissue to bits. Although larger than other goblins, bugbears are capable of slinking through small spaces when the need presents itself, and can hide in the shadow of a closet door as well as most of their smaller brethren.

Bugbears' porcine noses are incredibly keen. Their sense of smell is better than any other goblinoid and better than most animals as well. Still, their noses are far from perfect, and the air passages constrict to catch the nuance of a scent. The effect sometimes causes bugbears to wheeze freakishly as they sniff the air, puffing in nostril-fills of scent rapidly. When bugbears

BRAMBLE-SICK BRANDY

In most forests, a bramble called tomb herald—because it grows near burial grounds—is prized by bugbears. When eaten (a painful experience), the thorny bush slightly enhances the monster's ability to smell fear. When fermented into a spirit, the bramble's power increases in potency. When a bugbear is drunk on bramble-sick during a hunt and catches the scent of a victim's fear, it temporarily gains a +2 morale bonus on all attack rolls and skill checks (for as long as it smells pungent fear from a foe within 30 feet). The drink makes the imbiber very ill once its effects wear off (1d4 hours after consumption), causing it to be nauseated for 24 hours. Many bugbears are willing to tolerate this in exchange for the power of the brandy. More than a few adventurers have happened across a bugbear after a night of indulgent bramble-sick-enhanced hunting and found their quarry particularly easy to defeat.

fail to sneak up on their foes, it is not their footfalls or the rustle of their leathers that give them away, but more often their wheezing.

Bugbears smell fear more strongly than anything else and it intoxicates them. For a bugbear, the hunt is a narcotic experience, and the point is not to kill a victim undetected as much as it is to inspire dread and unease.

The average bugbear lives only 20 blood-soaked years, during which it culls hundreds of lives with its homicidal nocturnal hunts. While goblins breed almost incessantly, bugbears tend to focus their attentions elsewhere. Bugbears only bother to breed a few times in their lives, as they tend to keep to themselves, even when hunting and living in groups. When bugbears do procreate they frequently give birth to twins or even triplets. Although the hardy goblinoids are physically capable of carrying several young, the birthing process often proves difficult, the danger increasing exponentially for each child. Even though birth is often a solitary affair, handled by a female bugbear alone, the mother's death during delivery typically proves little hindrance to her relentless young, most of which prove brutally capable of fighting their way into the world even under the most appalling conditions.

The impressive self-sufficiency of bugbear young only grows as they age, leaning to hunt by age 2 and reaching full-size within 5 years. Bugbears do not coddle the weaklings among their brood, and only infant bugbears who exude little or no fear survive at all. As they age, the weak are further culled by their own brothers and sisters, the games of war and sibling rivalries of other races taken to a brutal and often lethal degree among bugbear kin. As a result, those bugbears who survive their pitiless childhood are ruthless specimens who know nothing of fear or mercy.

BUGBEAR SCARS

Bugbears have no families and raise no children to remember their hunts or deeds. Therefore, they record the stories of their lives on their skin in brutal, self-inflicted scars. These scars have no discernible shape to anyone besides other bugbears, but other bugbears decipher the scars with ease. Bugbears choose their mates based on the "tale of great hunts" told in these scars, picking worthy fathers or mothers for their broods to ensure the offspring are fierce hunters and can survive being abandoned at early ages.

Habitat & Society

Bugbears are the loners of goblinkind. One creation myth claims the first bugbears were born to goblin parents, but emerged from the womb covered in shaggy fur. They soon proved far different from their kin, delighting in terrorizing other children and eventually murdering several members of the tribe, until they were cast out to wander aimlessly forever alone. Some skulked in the shadows surrounding their parents' communities and preyed on their own, savoring the fear. On occasion, adventurers discover goblinoid settlements reduced to ghost towns. Some whisper that such places are laid to waste when a family in the tribe birthed a bugbear and it hunted them to the last.

Whether there is any truth to this tale or not, bugbears abhor the company of others most of the time. Their sense of community among their own kind is equally blunted by their thirst for the hunt. Bugbears rarely bow to any sense of family, and whatever camaraderie they bear for their mates, brethren, or children is always under attack. Most groups are short lived, torn apart from within before long, unless a steady source of prey remains readily available.

Bugbears are consummate hunters. It is in their souls to stalk and kill. Long ago, before humans claimed much of the land, bugbears hunted elves, lesser goblinoids, and animals in the sprawling wilds untainted by human civilization. Now humans take the trees, building houses in their stead. The prey and terrain might have changed, but bugbears haven't. They still hunt and terrorize. Creeping under porches and stealthily skirting rooftops, they prowl a forest of hewn wood and masonry as surely as their ancestors stalked in the shadows of tree and rock.

Humans proved delicious. Bugbears now prefer humankind to all other game. Only blink dogs, for some strange reason, issue as tantalizing a scent of fear, and they are much harder to catch than humans. As humans replaced elves as bugbears' preferred targets, stalking the loved ones of their intended prey became a favored sport. Elves seem to be less emotionally concerned for their families than humans, who experience great anguish when loved ones suffer.

As humans spread out into the wild lands, bugbears' ideas of perfect hunts evolved. To take victims' loved ones right from their beds without the targets detecting the intrusions became the favorite sport of many bugbear hunters. The bugbears claim the ears as trophies and leave the wrecked remains on the family's doorstep or in their barn, to be found only after a frantic search of the house. Sometimes, to sweeten the terror, the bugbears leave severed fingers or a few teeth for the family to discover first. The bugbears then prowl from window to window to observe and enjoy the victims' mounting panic as the search intensifies. In townships and cities, where other humans lurk close by, bugbears take great precautions to ensure their frenzied terror-fests go uninterrupted.

Bugbears are wanderers by nature. They prowl the wilds from town to town, hunting travelers and plaguing communities until forced to move on, when either the humans abandon the settlement in fear or meddling adventurers chase away the bugbears.

As the largest and most brutal of the goblinoid races, bugbears sometimes force their weaker cousins into service. Groups formed around these bruisers are typically little more than mobs that engage in short-lived rampages, typically ending when the bugbear's own brutality tears its band apart. More often, the better organized bands and armies of hobgoblins manage to direct bugbear savagery, employing them as front-line fighters or simply destructive distractions sent before their hordes.

Bugbears frequently engage in the ritual of scarification. Bugbears dig furrows and patterns in their flesh or brand themselves with heated irons. On most bugbears, these scars are well hidden beneath their fur, but on others the self-scarring is more extensive, leaving entire patches of their pelt laid bare to show ugly ropey clusters of scar tissue beneath.

The only other trapping of civilization bugbears take to is the collection of mementos. These mementos are no keepsakes to remind them of dead family or friends, but rather trophies to hearken back to memories of their favorite hunts. Bugbears usually take ears, but some claim possessions of the victims, such as articles of clothing or jewelry that caught their eyes.

Campaign Role

Use bugbears to bring a sense of dread to the PCs. The characters most likely encounter bugbears early in their careers, and you might use these monsters to give the party its first taste of true heart-pounding terror for terror's sake. If the players seem nonplussed by "fear," show them the true meaning of it with bugbears. Putting the PCs' own lives on the line is something they deal with everyday. Mortal danger comes with the territory and PCs get used to it quickly. Instead, use bugbears to go for the people the PCs care about. Bugbears have no real urge to slay a heroic PC, but they very much enjoy the scent of absolute terror pouring off an adventurer who learns his own sister is missing, especially when he finds a bit of bloody hair on the doorstep with the ribbon the PC gave her still tied around it.

Bugbears make the perfect foes for a serial-killer adventure, in which a night stalker preys on townsfolk, reaping the helpless and taking their ears for trophies. They also make good early boss monsters whom even their goblin minions fear.

Treasure

Bugbears have no need for treasure. They have no sense of society and therefore don't value currency in any form. On occasion, bugbears might claim valuable baubles or grisly trophies as mementos from victims, but they do not choose these for monetary value. Despite their disinterest in monetary wealth, the brutish goblinoids do have an innate sense for objects that terrify, often gathering fundamentally frightening or eerie items—bloodstained blades, yellowed bones, wooden fetishes—which they work into weaponry or armor. Thinking nothing of the inherent value of such accoutrements, what a bugbear might view as nothing more than another spike on its armor might in fact be a dirty, but finely crafted dagger or other useful tool.

While bugbears ignore gold and other treasures for the most part, they prize items that give them advantages in hunts, such as *cloaks* and *boots of elvenkind* or *rings of invisibility*, all of which make the bugbears better at sneaking up on victims. Magic items that allow the bugbears to spy on potential victims or travel from one homestead to another quickly reduce the agonizing time spent between hunts. Magic arms

BUGBEAR FEATS

SCENT OF FEAR

All bugbears smell fear, but some sense it far more keenly than others. These bugbears gain advantages against most foes and prove particularly dangerous against those whose spirits are curdled by terror.

Prerequisites: Possess the scent ability, any evil.

Benefit: You can track by smell and automatically pinpoint the location of opponents by scent alone if they are within 30 feet. In addition, you gain a +2 morale bonus on attack rolls against shaken or frightened opponents, and you can detect them at twice the normal scent range (120 feet, pinpoint at 60 feet). You gain a +2 bonus on all Will saves as long as a shaken or frightened target is in range. You cannot be surprised by anyone who is shaken or frightened within range of your enhanced sense of smell.

SOW TERROR

Bugbears are stealthy, and sometimes they use their skill at furtiveness to inspire dread in their prey.

Prerequisite: Stealthy.

Benefit: Anytime you win an opposed Hide check by 5 or more you might sow terror as a standard action. You do so by scraping your nails slightly on a solid surface, causing a board to creak ever so lightly, or rapping on a window pane. The victim cannot detect the source of the sound and dismisses it as the wind or some other mundane source, but the idea that something might be lurking nearby festers in the victim's subconscious. The victim must roll a Will save (DC 10 + 1/2 your character level + your Charisma modifier) or become shaken for 1d4 rounds.

and armor, of course, are likewise valued by bugbears, although not to the same extent as other savage humanoids. Typically, bugbears have little knowledge or interest in the magic at work in their items, knowing only that they do what they do. Thus, even a bugbear's most valued and valuable magical treasure is likely to be a filthy, gore-stained wreck.

Variants

Bugbears of all kinds infest the world.

Some bugbears, known as kardans, have dark gray fur and prove far stealthier than their lesser brethren. These bugbears sometimes possess the vexing ability to appear as something other than their terrifying selves for short periods of time—such as chairs, rocks, tree stumps, or even the likenesses of loved ones. Kardans gain a +8 racial bonus on Hide and Move Silently and have the following spell-like abilities: 3/day—*disguise self*, *minor image*. A kardan is CR 4.

In wintry climes, albino bugbears called wikkawaks prowl the glaciers by night, hunting settlers and prowling the frosted roofs of log cabins. These creatures fear no wind and bear the bite of cold remarkably well. They also purportedly leave no tracks, although sprinkling salt in the snow shows a wikkawak's prints. Wikkawaks can quell fire and lantern light with a thought. Wikkawaks have cold resistance 5 and the following spell-like abilities: at will—*pass without trace*; 3/day—*quench*. A wikkawak is CR 4.

In swampy environs or near great rivers, another form of bugbears, called murds, is said to exist. Its fur caked in muddy earth, the thing can turn into sludge-like tar at will. In this form, a murd flows through pipes, under doors, and up through cracks in the floor. These menaces easily seep into the homes of men and murder to their delight before slinking away again. It's said a murd fears all serpents and cannot enter a house where a snake is kept as a pet. Murds have the supernatural ability to use a version of *gaseous form*, at will, to become viscous mud. When in mud form, a murd can squeeze through any gap water can and can "flow" uphill, against gravity (although it must succeed on Climb checks as normal). A murd is CR 3.

Some bugbears adapt to human environs better than other goblinoids, and a relatively new species of these terrors has been rumored of late. Called slate-stalkers, these bugbears possess fur containing the gray-black-brown of most urban environments. In addition, these things feed on the coal of industry and woodsmoke. They fear no taste of flame and crawl down hearths where fire burns within to gain access to their prey. They also possess a horrid power of selectable invisibility in which they are visible only to their victims and unperceivable to others. Slate-stalkers especially enjoy terrorizing victims as family and friends look on, dumbfounded at their loved ones' "madness." Slate-stalkers have fire resistance 10 and a +4 racial bonus on Hide checks made in urban settings, and possess the supernatural ability to become invisible to all but one creature three times per day. Except for its chosen creature, the slate-stalker enjoys all the benefits of the *invisibility* spell. A slate-stalker is CR 4.

Some bugbears are stillborn, but suddenly wheeze in a sharp intake of breath and return to life a full hour after their dead birth. These are the worst bugbears of all. Forever half-dead, these things, called koblaks, have eyes even larger than their kin and see through walls and over hills. In addition, these abominations can terrorize victims after death and even learn the secrets of their victims. Koblaks can also scare victims to death and take great delight in doing so. Children slain by koblaks rise as attic whisperers (see *Pathfinder*

#1). Koblaks are half in our world, half in the next, and they do not die easily. Time refuses to reap them, and some live for centuries. They are particularly difficult to slay, and any weapon employed against them is nearly useless unless it is sprinkled with grave dirt first (DR 10 against any weapon not sprinkled with grave dirt). It's said grave dirt is the only thing capable of calling them back to beyond the pale from which they were born. Koblaks have 8 HD, are immune to fear and mind-affecting effects, and possess the following spell-like abilities: at will—*clairaudience/clairvoyance*, *speak with dead*; 1/day—*phantasmal killer*. A koblak is CR 6.

Bugbears in Golarion

Bugbears menace lightly populated regions in Golarion, most notably places where humanity has recently expanded, such as the region of Varisia. The Mierani Forest used to be thick with these monsters, but since the elves departed, bugbears moved on to other prey. Some people claim the bugbears fled the forest, driven off by something even more terrifying. Now they are spread far and wide across Varisia, drawn to the fledgling cities of men clinging to the region's coastlines.

The island of Kortos was once densely forested before the arrival of Aroden, who hewed the trees while erecting Absalom. Bugbears long ago migrated to Kortos and some dwell there still, although now they creep in dark corners of the urban landscape. In particular, a koblak bugbear of great power named Vesper slinks about Absalom. Vesper makes his home in the desolation of Beldrin's Bluff, most likely among the undead children of the Drownyard. Vesper often travels the city, visiting the darkened attics of dozens of old estates to spend time with his "lost children"—a collection of attic whisperers he gave rise to with his predations.

Murds abound in the Mwangi Expanse. These deadly hunters are so populous that many native tribes revere snakes and snake gods as protector spirits, keeping several trained specimens in their homes to ward off the "things in the darkness."

Names

Bugbear names tend toward savage, simple constructions, often in combining fearsome words in human languages or Goblin.

Male: Bander, Bershank, Bilgra, Bogey, Daul, Geth, Grizzletooth, Halk, Hugga, Jabb, Roofer, Shak, Shamble-Gait, Slinker, Spalg.

Female: Banra, Bloodra, Fanka, Jalru, Libba, Melg, Narb, Rafter, Sill-Creeper, Silla, Shadow, Sniggletooth, Ulu, Wilda, Yarsha.

BUGBEAR

This ugly creature resembles a twisted shadow puppet's silhouette, a wild thing of flared black and brown fur whose pelt juts out from its body at freakish angles. The crouching shadow's ears are large and floppy, draping shoulder-length, adding to the creature's unnatural shape. Its eyes are too big for its head. Tremendous milk-white ovals loom on either side of the thing's wheezy pig-like nose. Its panting mouth is filled with bristly needle-teeth spider-webbed in disgusting strands of yellowish saliva, all vibrating to the tune of its wheezing breath.

BUGBEAR

CR 3

Medium humanoid (goblinoid)

Init +1; **Senses** darkvision 60 ft., scent; Listen +2, Spot +2

DEFENSE

AC 17, touch 11, flat-footed 16

(+2 armor, +1 Dex, +3 natural, +1 shield)

Fort +2, **Ref** +4, **Will** +1

OFFENSE

Spd 30 ft.

Melee morningstar +5 (1d8+2) or

Melee kukri +5 (1d4+2/18–20)

Ranged javelin +3 (1d6+2) or

Space 5 ft.; **Reach** 5 ft.

TACTICS

Before Combat Bugbears slink in shadow and behind closed doors. They revel in the look of terror on a foe's face when they suddenly loom from the darkness, often with some horrible trophy in hand.

During Combat Bugbears do not enjoy protracted fighting and seek to down a foe and slip away as quickly and quietly as possible. They favor hit-and-run tactics when the situation allows, striking at the most vulnerable point or member of a group.

Morale A bugbear is not foolish enough to fight to the death, as that would preclude it from menacing others at a later date. It usually flees if reduced to 5 hit points.

STATISTICS

(5), jug of bramble-sick brandy, kukri, leather armor, light wooden shield, morningstar, pliers, trophy necklace of ears

You'd never guess such brutes could be so quiet, but let your guard down and they're on you—their breath like a wolf's, their eyes like death.

The ecology of the Bulette

by Chris Elliott
and Richard Edwards

"Brethren of the Guild of Naturalists!"

The hum of conversation in the hall fell to an expectant hush as the speaker, a short, balding man in the robes of a Guildmaster, raised his arms for silence.

"For untold years, there has been no sighting of the Teeth in the Earth, more prosaically known as the Land Shark, and even in the Guild there were many who dismissed the tales of this spawn of sorcery as little more than legend.

"Tonight, however, we have with us a man who has not only seen one alive and been within three poles of the behemoth, but actually hunted it for trophy!

"From the land of Morn — A'ahb the Hunter."

The Guildmaster stepped back, his place taken by a tall, rugged man in sandy-colored robes; black-bearded, hook-nosed, burnt and weathered by sun and wind. Without preamble, he addressed the expectant Guildsmen.

"I've hunted all kinds of game, but like most of you I never thought the bulette, the land shark as you call it, was anything but the stuff of legend. How could such a beast swim through the earth like a fish through water, even if it was magical?

"Then, five years ago, I was in a little known and even lesser traversed area of Morn when I heard rumors of tribes that tracked such a beast, digging the earth from where the bulette had passed, taking the mud that they found, and smearing it on their plows.

"I asked the reason for this strange practice and was told that it made the plows cut the earth like the prow of a boat cuts the water. I began following the source of these rumors, to the east, deeper into the interior of the sparsely populated wilderness.

"I was approached by the headman of a native village shortly after my arrival on his premises. He confirmed the stories I

had heard, and from what he said I began to get an idea of the nature of the beast.

"It existed — that much seemed certain — and its uncanny powers must come from an ability to secrete a slime from its skin that works like the potion for transmuting rock to mud, known to some wizards and alchemists. But this secretion must be weaker than the potion in strength and duration, and it seems to work only on earth, not rock.

"The headman said that he was glad I had come this way. His village was being terrorized by an enormous rogue bulette, an albino of the species, that the natives called 'Mobh Idich' — The Great White One. Many warriors had tried hunting it, but it would either pick them off singly, or, gathering speed beneath the surface, it would burst forth upon a small group, just as a porpoise leaps out of the water, and devour them all.

"The headman asked me if I thought I could kill it. I didn't know if I could or not — but I knew I wanted to try. . . ."

The hunter paused, perhaps savoring the anticipation that he knew his audience was feeling.

"When I first saw a bulette on the surface, it fitted all the partial descriptions I had heard. Its body was articulated, and covered in thick, scaly plates that built up into a carapace on its back. Part of this shell could be extended to become the horny fin that produces the weaving furrows that criss-cross the land shark's domain. Its stocky, powerful limbs can be retracted while its muscular tail is propelling the beast through the earth. The mouth opens almost to a right angle, revealing a gaping maw filled with rows of dagger-like teeth.

"The beast is warm-blooded and breathes air, surfacing to do so. It is likely they bear live young, but if so this is done beneath the surface. As far as I know, a pregnant female has never been seen.

"I can tell you are wondering how I got close enough to the beast to find out all of this without being eaten. Well, you can find out these things from a *dead* one just as well — and I found a way to *kill* the bulette that has worked for me time and again since the first.

"From what I had been told, I figured that the bulette hunts by tracing vibrations in the earth, rather than by scent. So, I caught myself a kobold. A horse would work just as well, but they're much too valuable to use for bulette bait. I found a solitary tree, tied the kobold to the trunk on a short rope, and nestled myself in the branches with my heavy crossbow in hand.

"The kobold circled frantically. I sent an occasional reminder in its direction with my crossbow when it started to slow down, and after a while the constant movement of the kobold in the small area had done its task. I sighted a large fin weaving across the plain. It circled the tree, spiraling inward, and then abruptly made its final rush.

"As it burst from the earth, jaws wide open and mud streaming off its flanks, I let fly with a large quarrel smeared with poison — right down its gullet.

"What's that? Yes — only one shot, thanks to the poison. Really, once you've got the technique down, it's quite easy. I've killed others since the first day, but there's always something special about the first one. I still keep the hide of The Great White One as a memento. . . ."

At this point A'ahb the Hunter pulled on a cord, and a cloth behind him fell away to reveal a huge skin stretched on a frame. The meeting dissolved in chaos as members of the Guild fought to be the first to examine it.

(An earlier version of this article appeared in *Dragonlords — Yet Another Fantasy & Sci-Fi Roleplaying Magazine*.)

Bulette

Our sixth day out from Delmon's Glen we made camp by a small creek and settled in. Around the moon's apex, the ground rumbled, our tents collapsed, and rocks crashed into our camp from the cliffs above. Then silence. We had set to fixing the camp and mending wounds when the beast exploded into our midst like a ballista bolt, claws flashing, mouth agape, the canyon echoing with its bestial roar. Clansmen fled in all directions, but none could flee fast enough. The monster was on us all and fed on man and horse alike. It was as though Asmodeus himself opened the gates to Hell, and we were camped on perdition's doorstep.

—from the journal of Rolgar Ironsson,
Ulflen merchant

Of all the beasts that populate the wilderness, few are as feared as the bulette. Known sometimes as the landshark, the bulette is a sleek predator, moving as fluidly through earth as those primeval eating machines move through water. Bulettes possess insatiable hunger and view anything that moves as food. They hunt constantly, and when their attention turns to new hunting grounds they feed until nothing remains. They are the stuff of nightmares, the bane of the wilderness—brutal, savage monsters whose ferocious majesty was not evolved, but intentionally crafted.

OVERVIEW

While the process that created the bulette is long lost, many rumors abound regarding the origins of the landshark. According to popular lore, a cabal of arch-wizards seeking new beasts to guard its secret lairs created bulettes thousands of years ago. Many claim bulettes are a cross between two ordinary animals—the snapping turtle and the armadillo being the most common—which were then infused with the essence, or ichor, of demons. Though

no one alive today knows the absolute truth behind their origin, one thing is clear: bulettes are insatiable predators. Simple creatures that roam from region to region seeking more abundant prey, they devour everything that moves. Nothing that can walk, crawl, swim, or run is immune to the hunger and rage of the bulette—though elves like to brag that their blood tastes too plant-like for the landshark, and dwarves brazenly claim bulettes dislike the taste of their flesh. These claims may have some truth to them, but most non-elves and non-dwarves assume they're the stuff of hubris rather than any specific truth. Bulettes especially favor halfling and horse flesh, and have been known to attack large parties just to kill and devour one of these treats.

Those who've come face-to-face with a bulette and lived to share the story talk of a mindless, emotionless brute. Sometimes they tell of a bulette heading into a village, gliding just beneath the earth's surface and snatching townsfolk or livestock. Others speak of a bulette erupting in the middle of their camp and consuming everything too slow to flee. Bulettes, it is clear, cannot be reasoned with—they are hard to trick, and can only be stopped with brute force. Voracious and tenacious, they hardly stop eating long enough to rest.

ECOLOGY

Bulettes typically live for 20 years, and spend all but the last few as solitary hunters. They prefer to roam temperate hills and plains in search of food, but have been spotted in tunnels deep beneath the surface as well as in deserts, atop high mountain plains, and (rarely) in arctic zones.

It's rare to find bulettes dead of natural causes in the wild, as in addition to the creatures' tendency to die in battle, sages believe that most aging bulettes' organs simply give out while they are engaged in the physical exertion of tunneling, entombing them where they fall beneath tons of dirt and stone. Some primitive tribes believe that earthquakes are caused by the death throes of these great creatures, deep within the earth.

Physically, bulettes are very complicated creatures. Their bodies are massive, typically growing to 15 feet in length and standing 8 feet or more in height. Young bulettes mature quickly, reaching full size in less than a year. In regions where food is plentiful and competition scarce, bulettes have been known to grow to nearly 20 feet in length and 12 feet in height. A bulette's armor plating is made of the same material as its skeletal structure. Young bulettes bear soft and malleable armor plates, and dwarven blacksmiths pay exorbitant amounts of gold to acquire them, as they can shape the plates before they harden, thus producing custom bulette plate armor. Once a bulette reaches its full, adult size, its armor plating is as hard as steel, making it a very difficult creature to penetrate with either blade or arrow.

CREATING A BULETTE

It is commonly believed that the bulette was created by crossing an armadillo with a snapping turtle, infusing the union with demon ichor. While the specifics have long been lost, some researchers have attempted to duplicate the experiment. Their notes state that especially large specimens of each animal are needed, as well as the spells *animal growth*, *bear's endurance*, *bull's strength*, *darkvision*, *jump*, *permanency*, *polymorph*, and either *barkskin* or *stoneskin*. The animals are placed in a large sealable container, then doused with the ichor from a powerful demon, with stronger demons giving the reaction a greater chance of success. After adding the ichor, the creator seals the container, casts the required spells (alternately, potions of the weaker spells may be mixed with the ichor beforehand), and hopes for success.

How reliable the process is remains difficult to determine, as few of those who attempt it are ever heard from again.

Bulettes have massive torsos and thick legs that end in long, incredibly sharp claws that they use to burrow through the earth. Their musculature is entirely focused on moving the jaw (for eating) and the legs (for digging), making their claws a fearsome weapon and their bite a terrifying thing to behold. A series of elastic tendons runs the length of each leg and is anchored at the knees, hips, and ankles; originally evolved to help the creature quickly extricate itself from collapsed tunnels, these powerful muscles allow the ponderous beast to leap incongruously into the air with little effort, bringing all four claws to bear on an adjacent—and usually astonished—opponent.

Beneath the skin, bulettes are designed to eat. They have six stomachs, each one smaller than the last, and each processes food differently. The stomach acids of a bulette can melt armor and lay waste to magic trinkets. Only the toughest, magically enhanced metals can resist the digestive process. This lets bulettes eat their prey whole—gear and all, in the case of humanoids—without stopping to think about what they're eating. Their stomachs are disgusting, churning masses that break nearly everything down into a smelly pulp; alchemists prize the stomach acid of bulettes for its caustic properties.

A bulette's impact on its environment is severe. A peaceful valley of villages, farmland, and fish-filled streams can be turned into a wasteland of death and decay in just a single fortnight of bulette activity. When moving into new and bountiful territory, bulettes can go days without sleep. This same peaceful valley quickly finds its livestock gone, its buildings knocked down, its villagers eaten or fled, its streams emptied, and its forests devoid of wildlife. The constant burrowing also churns the farmland into a rocky waste, uproots trees, weakens or destroys the foundations

of dwellings, and drains entire ponds or lakes by opening tunnels into deep caverns.

HABITAT & SOCIETY

Bulettes have a 5-month gestation period and are born singly to a mating pair. A baby bulette possesses the same insatiable hunger as its parents and begins to hunt the moment it's born. Though its armor and claws are softer than an adult's, they still offer a measure of protection to the young landshark, and the claws are sharp enough to rend flesh. Young bulettes always follow behind the mating pair as they burrow together from hunting ground to hunting ground, as it'll be a full year before the whelp's claws are strong enough to tear through dirt, rock, sand, and clay. A mating pair of bulettes can have as many as six young before reaching the end of their lifecycle.

Once a bulette reaches a year old, it sets out on its own, beginning a lifetime as a solitary hunter. Adolescent bulettes seek hunting grounds that yield no competition from others of their kind. They can roam as far as 1,000 miles from their birthplaces, but tend to restrict themselves to a well-populated region of 500 or so square miles. When a bulette settles into a region to feed and hunt, it tends to travel the same routes again and again, leaving behind a complicated, twisting, and often unpredictable tunnel network of hard-packed earth and rock. These near-permanent remnants of a bulette's travels are called "shark holes" and are very dangerous to travel. While cave-ins, rockslides, and burrowing bulettes are ever-present dangers, they can be very useful paths from the surface to the dark caverns below.

Bulettes are primarily nocturnal, and tend to sleep out the warmest parts of the day in crater-like nests on the surface called "drifts." A given bulette usually maintains dozens of drifts at intervals along the borders of its territory, which it uses as it makes regular circuits around the area. Sleeping bulettes curl into balls, with the armor plating of their backs protecting their slightly more vulnerable underbellies. Since most predators know better than to bother a sleeping bulette, clever creatures (including humanoid hunters) sometimes find temporary shelter inside empty drifts, usually determining the risk by

the state of the droppings at the pit's bottom. If they're too fresh, the bulette may still be in the area. Too dry, and the beast is likely close to completing its route and returning. But for those drifts in which the droppings are dry on the outside but still moist in the center, their owner is likely several days away on the other side of its territory, making the drift a haven for those who know how to read the signs.

Bulettes seek out a mate around their seventeenth year of life. They roam far from their solitary hunting grounds and even bypass plentiful food sources in order to track a potential mate's scent. As their instinct shifts from eating and hunting to propagating the species, bulettes become more aggressive, seeking to expand their territories in order to provide for the forthcoming young.

Bulettes mate for the remainder of their lives and do not seek another mate if one is killed. The female bulette spends most of the last few years of her life pregnant, birthing over several seasons before the strain eventually takes its toll. A male's aggression peaks when the female bulette is pregnant, and his hunting prowess excels as he attempts to satisfy his mate's increased appetite.

Other than mated pairs, bulettes avoid direct confrontation with others of their kind. Whether this is simply a natural instinct or part of their magical "programming" from their creation is not known, but it is known that two bulettes, tossed into a fortified arena and expected to face off, will not fight one another, and will even work together to escape. All living creatures should be thankful that bulettes are solitary, as the only thing more dangerous than one hungry, captive bulette is two working together.

CAMPAIGN ROLE

GMs can introduce bulettes to a campaign in many different ways. A panicked village might hire the PCs to deal with a bulette that destroyed an outlying farm—given the creature's appetite, the rest of the village is surely next. Elven protectors of a forest might locate a series of bulette drifts and ask the PCs to find the bulettes responsible before the monsters depopulate the woods. Because it can travel underground, a bulette might pop up anywhere, while the PCs are traveling or even in the middle of a quiet camp. A location completely destroyed by a bulette attack could serve as a backdrop for an entire "home town" campaign, with the

PCs first discovering the aftermath of a bulette's hunger and then spending months or years helping the townsfolk rebuild and fortify against threats. The PCs may stumble upon a mated pair and experience a unique encounter wherein the female shields her young while her mate ferociously attacks the PCs. Finally, there's always the option of exploring the monsters' origin. Who created them? Was it a cabal of wizards, or a lone madman, and for what purpose? Did these early bulettes escape their creator, or were they released deliberately? Does the creator still exist, perhaps in a lich-like state? What other monstrosities were born in that ancient laboratory? Answering these questions could make for months of exciting gaming.

VARIANTS

A common artificial origin has spawned a number of monsters closely related to the bulette. Some of these are simple variations of the base bulette, with mottled skin colors, thicker armor plates, or smaller sizes, while others are distantly related, barely recognizable mutations or experiments.

Leprous Bulette: Bulettes can contract leprosy, usually by eating an infected humanoid, and pass the disease on to any humanoid lucky enough to survive the creature's attack. For more information on leprosy, see *Pathfinder Adventure Path* volume #8.

Spiny Bulette: Sages believe this is either a mutation or a new breed created with a hedgehog or porcupine as the base creature rather than an armadillo. Large spines jut from between its armor plates; anyone attacking it with natural attacks or unarmed strikes take 1d6 damage and must make a DC 16 Reflex save or have the quill break off and embed in his flesh. Lodged quills impose a -1 penalty on attacks, saves, and checks per quill. The save DC is Dexterity-based.

Xenarth: The most feared bulette mutations are the xenarths. Also called ichor sharks, xenarths are an incredibly rare species of bulette that most believe long vanished from the world. Since the original bulettes were created with infusions of demon ichor, many have long associated them with demons despite the fact that they're simply magically created beasts. Xenarths, however, are actually demons. At the moment of the creation process when the fused animal parts were combined with demon ichor, xenarths were imbued with an excess of this essence, becoming demonic outsiders, creatures not of the Material Plane. Xenarths are covered in a slimy red ichor that burns like acid when touched and helps propel them through the soil much quicker than the bulette. Xenarths are brutal and even more frightening than their cousins. Bulettes eat to fuel an insatiable hunger—xenarths eat for the pure pleasure of destruction, and have been known to eat, regurgitate, and move on to other food.

BULETTE ARMOR

Dwarves have long treasured bulettes for their thick hides and armor plating. In fact, some dwarf clans require their young to travel on long pilgrimages to areas thick with land sharks to hunt the reclusive and vicious beasts, intent on harvesting their plates for armor. A single adult male bulette has enough armor plating and hide to produce two sets of Medium bulette plate mail and four sets of Medium leather or studded leather armor. These armor sets are more often than not imbued with the delving armor quality, and veteran dwarf bulette hunters are rarely seen without their +1 *delving bulette full plate* while on the hunt. Creating bulette armor from the creature's hide requires a skilled armorer; crafted bulette armor may be normal or masterwork quality.

A set of bulette plate is functionally similar to metal full plate, but is prized by wealthy collectors and military commanders the world over, and tends to sell for up to 10 times more than a normal set. Bulette full plate is slightly heavier (65 pounds) than regular steel plate, but is more flexible and durable (max Dex bonus +2, hardness 12).

A suit of bulette leather armor weighs 20 pounds, and its appearance matches the coloration of the landshark from which it was made. It sells for 50 gp, but has the same statistics as studded leather.

BULETTE BULWARK (SHIELD)

Aura Faint abjuration; **CL** 9th

Slot shield; **Price** 9,157 gp; **Weight** 15 lbs.

DESCRIPTION

Fashioned from a bulette's neck armor, this +3 *heavy shield* is as hard as steel (hardness 10, 20 hp). Because it is not made of metal, druids can use it without penalty.

CONSTRUCTION

Requirements Craft Magic Arms and Armor, 1 intact set of neck plates from a bulette; **Cost** 4,657 gp, 360 XP

DELVING (ARMOR QUALITY)

Aura faint transmutation; **CL** 5th

Price +2 bonus

DESCRIPTION

Wearing armor with this quality grants you a burrow speed of 10 feet. This speed allows you to tunnel through any type of soil, including rocky soil, but not actual stone. This quality does not give you the ability to breathe underground, so you must hold your breath or use other magic that provides air. You gain a +4 bonus on all saving throws against landslides, avalanches, tunnel collapses, and similar effects. This armor quality may not be applied to shields.

CONSTRUCTION

Requirements Craft Magic Arms and Armor, *soften earth and stone*, 25 lbs. of bulette armor plating

Xenarth

This huge beast rests atop four thick legs that end in sleek, curved claws, and its body is covered in red-hued armor plates that drip with foul ichor. Its eyes glow red like hot coals, and strange veins between its plates pulse and glow like flames. Along its spine, a slender armored crest peaks at mid-back, much like the top fin of a shark.

Space 15 ft.; **Reach** 10 ft.

TACTICS

Before Combat Unlike their stupid cousins, xenarths possess some tactical skills. They prefer to sneak up on opponents and often trail potential victims unobserved from their underground tunnels, studying them and learning their weaknesses before ambushing them in advantageous terrain.

During Combat Xenarths are afraid of nothing and attack with reckless abandon. They revel in the act of violence and eat everything they kill, if only to vomit it forth again later in a grisly and triumphant torrent.

Morale Xenarths fight to the death.

SPECIAL ABILITIES

Demon Ichor (Su) A slimy red ichor coats the xenarth's armored plates. Any weapon that touches a xenarth takes 3d8 points of acid damage from the corrosive demon essence, and the weapon's hardness does not reduce this damage. A magic weapon may attempt a DC 17 Reflex save to avoid taking this damage. A creature that strikes a xenarth with an unarmed attack, unarmed strike, melee touch spell, or natural weapon takes this damage unless the attacker makes a DC 17 Reflex save. The save DCs are Constitution-based.

Poison (Ex) Injury, Fortitude DC 23, initial damage 1d6 Con, secondary damage 2d6 Con. The save DC is Constitution-based.

BULETTES ON GOLARION

Created at the beginning of the Age of Omens as guardians for magical libraries of the Azlanti, bulettes were trained, magically controlled soldiers for many ancient cultures, including Thassilon, Jistka, and Ancient Osirion. As those societies fell, the bulettes were loosed upon the world, and heavily infested the shores of the Inner Sea and the vast plains stretching east into Casmaron. After a few hundred years, however, the number of bulette attacks started to decline, and eventually the landsharks vanished altogether. Commoners and adventurers rejoiced, believing the creature extinct. During that time, cults of Lamashtu devoted to the bulette as their spirit beast began organized, ritualistic prayer ceremonies begging Lamashtu to return the landshark to Golarion. Over time these ceremonies evolved into complicated weeklong affairs culminating in ritual self-sacrifice and mutilation.

A century passed before another bulette was seen, but as it turns out, Golarion's landsharks have a cyclic population pattern in the wild. Starting with small numbers, the race multiplies over the course of 200–500 years until, either as a result of overpopulation or increased predation by even larger creatures such as dragons, a few fertile elder bulettes tunnel far underground and hibernate rather than mating, leaving a generation of suddenly sterile stragglers to die off. The elders sleep so deeply that dwarven mining expeditions have mistakenly believed them dead, with the beasts only rising groggily when the stout folk try to carve off their valuable armor plates. (It is now a standard practice for dwarves to decapitate any bulette corpse they find, just in case it's actually a hibernating specimen). The elders generally sleep for 50–150 years, then wake, find mates, rear a clutch or two of young, and die, leaving the world to the next generation. The most recent decline happened a century before the death of Aroden, with the bulettes returning just before the start of the Age of Lost Omens.

Now that bulettes are active again, their numbers and presence on Avistan, Garund, and Casmaron are larger than ever. Their once relatively small hunting grounds along the shores of the Inner Sea have expanded as far north as the Worldwound (where they flourish despite an unusually high population density, gorging on demon flesh), all the way east into Tian Xia, and throughout all of Garund other than the Mwangi Expanse. Outside of the Worldwound, bulettes are common in Rahadoum, Thuvia, Katapesh, Nex, Geb, and the Storval Plateau in Varisia, and less common across the heavily populated northern and eastern shores of the Inner Sea. Although bulettes have been known to hunt in swamps and marshlands, they avoid the Mwangi Expanse for unknown reasons.

BULETTE

The ground rumbles as a giant fin pokes through the earth and glides effortlessly through the soil. Suddenly, the dirt explodes in a shower of roots and rocks and a mighty beast covered in huge gray armor plates emerges from the hole. Its eyes shine with malice, and an armored crest, much like a shark's fin, runs from the beast's neck back to a short, thick tail. It stands on four powerful legs, each of which ends in long, wickedly curved claws.

Special Attacks leap

TACTICS

During Combat Bulettes attack anything they think they can eat—and they can eat a lot. Their usual tactic is to focus on a single target until that opponent is dead, moving on to face any other targets attacking it, and stopping to feed as soon as no opponents are nearby. They erupt from the ground suddenly, the only warning their crests moving eerily through the earth, and attack everything in reach, disappearing as quickly as they appear.

Morale Bulettes are fearless and single-minded creatures; once they decide something is food, they fight to the death to get it.

The Ecology of Carnivorous Plants

Illustration by Jonathan Hunt

Some plants like green thumbs all too well

Giant man-eating plants, like dragons, goblins, and other weird creatures, are staples of modern fantasy fiction and most traditional legends. In the realm of the AD&D® game, official "monster plants" (such as the hangman tree, the choke creeper, and the giant sundew) are representative of the genre. Carnivorous plants are not truly mythical, though the real ones are not as monstrous as fantasy works portray them. The following article explains the ecology of fantasy carnivorous plants based on that of their smaller, factual cousins.

In the real world, carnivorous plants are represented by the various species of sundews, pitcher plants, butterworts, bladderworts, rainbow plants, water-wheels, pink petticoats, and Venus' flytraps. In the AD&D game, these carnivorous plants are represented by the giant sundew (*Monster Manual II*, page 116) and by the giant pitcher plant and the giant Venus' flytrap (*DRAGON®* issue #89, "Creature Catalog," pages C-14 and C-18).

Most plants with which we are familiar sustain themselves through the process of photosynthesis. Chlorophyll, which is contained in the leaves of the plant and which gives green plants their color, transforms sunlight into chemical energy. This chemical reacts with water (which is absorbed through the roots) and carbon dioxide (which is taken in through the leaves) to produce carbohydrates. These carbohydrates, along with the minerals and trace elements absorbed through the root system, are then utilized by the plant for its growth and development. Mosses, lichens, mushrooms, ferns, and the like are considered lower members of the plant kingdom because they either do not photosynthesize or lack other characteristics of green plants (such as a proper root system, reproduction via seeds, fertilization through pollination, etc.).

Carnivorous plants belong in the category of green plants, possessing all the requirements for classification as such plus two other traits which take them a

step beyond most such plants: the ability to self-reproduce without pollination and (most importantly) the ability to actively prey on insects and other minute animals for food.

Carnivorous plants are usually found in bogs, swamps, and freshwater marshes. The soil in these environments has a lower content of minerals and elements than is acceptable to most green plants. The lack of nitrogen, phosphorous, potassium, and calcium results from the high acid content of the water, which may be caused by frequent rains that leech minerals out of the soil. In warmer climates, this lack may be caused by a higher rate of bacterial decay which also uses up precious materials needed for plant growth. Plants such as the sundew, pitcher plant, and others have adapted to these poor growing conditions by evolving means for trapping and digesting living prey as supplements to their diets.¹

Despite the broad range of some species of carnivorous plants, they are on the whole limited by their specialization to their ecological niches — acidic bogs, marshes, and certain alkaline marls. In the northern temperate and subarctic regions, sphagnum bogs are a favored habitat. These bogs are the remains of ancient glacial lakes which have gradually become filled with decayed plant and animal remains. The stagnant waters are overgrown with moss and slowly become more acidic. The young bog then becomes the home of pitcher plants, sundews, and bladderworts, with butterworts growing along the sandy parts of the shoreline. A marl bog is formed by the seepage of spring water over a flat surface that has a foundation of limestone deposits. This results in the percolation of calcium carbonate throughout the water, making it more alkaline than normal and producing the same mineral-deficient conditions that exist in acidic bogs. Some pitcher plants and sundews have adapted to marl bogs.

In more temperate climates, acidic bogs may develop beside old lakes and sluggish streams and springheads. The movement of water under these conditions is too feeble to prevent stagnation. Here may be found pitcher plants, sundews, and bladderworts. In still warmer areas, savannah or grass-edge bogs form in low, flat, or slightly sloping areas with sandy soil and a high water table. The predominant vegetation consists of grasses, sedges, and widely scattered long-needle pines. Under these conditions may be found pitcher plants, bladderworts, butterworts, sundews, and Venus' flytraps.

Besides their restricted habitats (an especially serious problem for the Venus' flytrap, which is confined to savannah

bogs), carnivorous plants are threatened by the encroachment of more common green plants as the bog matures. By adapting to the mineral-poor conditions of the bog, carnivorous plants eventually change the bog by increasing the supply of nitrates, phosphates, and other minerals when those plants die and decay. As the acid level drops and the soil becomes richer and sweeter, other plants more accustomed to such growing conditions move in and crowd out the carnivorous plants.

All flowering plants normally reproduce by cross-pollination of their flowers by insects or the wind.² Carnivorous plants normally reproduce by this means, but they are also capable of reproducing themselves asexually.

For instance during pollination, the seeds of the Venus' flytrap are black and pear-shaped when it reproduces. The Venus' flytrap's asexual means of reproduction involves a fleshy, white, underground rhizome that elongates annually and from which new Venus' flytraps may grow. This underground rhizome also makes it very difficult for fire and other natural disasters to completely destroy the plant. Where temperature conditions are subject to uneven fluctuations (alternating warm and cool spring days, for example), the plant can also reproduce itself by budding. Through this process, the flowers of the plant are replaced by miniature plants which take root around the "mother" and grow normally. As a result, Venus' flytraps may be found growing in colonies.

The seeds of the pitcher plant are tear-drop shaped and range in color from brown to pinkish gray. Like the Venus' flytrap, this plant may reproduce asexually by means of a rhizome; resulting in colonies of pitcher plants connected to the mother plant). The giant pitcher plant in *DRAGON* issue #89 resembles the Australian pitcher plant, which can also reproduce asexually in a manner similar to that of the strawberry plant. The pitcher plant, in this case, possesses a root which acts as a central node for its thick, branching roots. Some of these roots form foliage leaves above ground in the shape of a rosette. In the fall, a pitcher plant embryo forms around the center of these rosettes. As the embryo grows, the runner leaf stalk lengthens, taking the embryo away from the mother plant. Soon, the leaf stalk ceases growing and the embryo plant rests on soil where it takes root.

The sundew's seeds are black and elliptical. Sundews living in the northern parts of the world or in mountainous climes form hibernacula to survive the winter. A hibernaculum is a small, tight, spherical

cluster of budlike young leaves that are hairy in appearance. The butterwort also shares this feature. Similarly, the hangman tree's taproot, which allows it to survive the winter, may be a further modification on the use of the hibernaculum.

The trapping season for carnivorous plants generally runs from spring until the middle of autumn and the winter dieback. Trapping methods among the carnivorous plants fall into either active or passive traps. Among the active traps are the bear-trap variety, used by the Venus' flytrap and the waterwheel plant, and the trap-door of the bladderwort. Less complex are the passive traps used by sundews, butterworts, and rainbow plants; these plants secrete a type of mucilage to form a sticky "flypaper" trap to ensnare their victims. The simplest trap is the passive pitfall used by the many species of pitcher plants.

The traps themselves are actually leaves that have been so modified by evolution that they are now barely recognizable as leaves. All the carnivorous plants, except for primitive species of pitcher plant, have developed digestive glands within these leaves. These glands secrete a mild enzyme to aid the breakdown and absorp-

tion of nutrients from the plant's victims. In the case of the flypaper variety of carnivorous plants, the leaves have also developed glands to produce and secrete the mucilage used in the trap.

How did these traps evolve, and how do they work? All plants have tropisms — reactions to particular stimuli — that help them find water, light, and nutrients; tropisms also help the plants avoid noxious substances and conditions. If seeking or avoiding something, a plant can control the growth of its cells and alter the direction of such growth by increasing and decreasing cell growth on either side of the plant. For example, the mimosa plant can fold up its leaves whenever certain insects approach with the intent of eating the leaves. For most carnivorous plants, this controlled cell growth is accelerated to the point where the plant's movements are faster than the eye can track.

In the case of the Venus' flytrap, prey is attracted to the plant's trap either by the red color on the inside of the trap-leaves lobes (which resembles raw meat) or by the scent of nectar produced by glands along the edge of each lobe. (All carnivorous plants have nectar-producing abilities

and, except for the waterwheel and the bladderwort, use scent as a lure.) Within the trap are six trigger hairs arranged in triangular groups of three on each lobe. The victim must brush two of the trigger hairs or one trigger hair twice in order for the plant to react. The first brushing of a trigger hair causes an electrical impulse to be stored in the leaf tissue, readying the trap. The second brushing sends a second impulse that causes the outer cells of the lobes to grow an additional 25%, thus causing the trap to close.

This growth spurt is very rapid; closure time for flytraps has been clocked at one-twentieth of a second. During cool weather, when the plant's reactions have slowed, the spikes that fringe the edges of the leaf lobes help contain the prey until the trap is fully closed.³ When fully closed, cell growth in the lobes continues, forcing the lobes together, pushing the air out of the trap, and squeezing the prey. To open, the inner cells of the leaf lobes grow an additional 25%, thus forcing the lobes to move apart from each other. The traps are capable of opening and closing several times a day; thus, rapid growth of individual traps is possible.

Venus' flytraps can survive periodic flooding, when their traps catch food in the form of insect larvae, tadpoles, and the like. A good-sized meal for the plant results in an overall growth spurt. The Venus' flytrap is capable of distinguishing between edible and inedible objects placed within its traps; it is also able to judge the size of objects so that it doesn't waste time on puny prey or things which it can't eat (as is also true for the giant Venus' flytrap).

The same principle of controlled cell growth permits the sundew to curl its armlike leaves around insects held helpless in the plant's glue. It also allows the butterwort to curl the edges of its trapping leaves to form a cup to hold digestive juices used for drowning prey that succumbs to the lure of its sticky surfaces.

Sundews, butterworts, and rainbow plants, by utilizing their mucilaginous surfaces to trap insect prey, are merely taking defenses used by plants a step further. Consider the South African roridgula, which has developed a carpet of sticky hairs over its stems and leaves as a defense against insect pests. The roridgula has also developed a symbiotic relationship with species of ambush bugs and spiders. Both of these creatures make their homes among the sticky strands of the plant and feast on insects caught by the glue.⁴

The pitcher plant may have been the first carnivorous plant to evolve because its method of catching prey is the simplest of all: a pitfall trap formed by the plant's leaves, which have grown together so that

water collects in the bottom of the pitcher and drowns whatever falls in. An intermediate stage in the evolution of the pitcher plant can be seen in the common teasel plant, whose cuplike leaves grow together around the stem, allowing water to collect and form miniature pools that protect the plant against insect pests crawling up the stem. The pitcher plant took this means of defense and evolved it into a means of trapping prey.

The more primitive species of pitcher plant rely on natural decay to break victims down into necessary nutrients for the plants to absorb. Other species of pitcher plant have developed digestive glands and wetting agents in the water inside the trap which help waterlog the victim and hasten drowning. There is some speculation among botanists that the nectar of the plant may contain a narcotic; this increases the likelihood that exploring insects fall in due to drunkenness.⁵

Fantasy carnivorous plants (i.e., the hangman tree and others) are higher on the evolutionary ladder than the common species of such plants. This higher evolutionary status may range from simple giantism without drastic departures from

the original plant (as in the case of the giant Venus' flytrap) to improvements on the original plant design (as in the case of the giant pitcher plant which, in addition to giantism and heightened tropic senses, has great, long tendrils for snaring and drawing prey into its stomach).⁶

The carnivorous plants in the AD&D game world have further developed alternative methods of catching prey, as is evidenced by the tri-flower frond, the man-trap, and the bloodthorn. The tri-flower frond and the man-trap use their pollen as both a lure and a drug to entice and kill their victims, much as actual carnivorous plants utilize their nectar as an insect lure (and as the pitcher plant might use narcotic nectar).

The bloodthorn has taken two characteristics of plants — thorns as a means of defense, and the principles of capillary attraction (which enable plants to feed themselves) — and has combined these into a unique means of attacking prey and feeding on it. Capillary attraction is the tendency for liquids confined in small tubes to rise up through the tubes as a result of surface tension. An example of capillary attraction is shown by placing a

straw in a glass of water. Surface tension draws the water up the straw from the open bottom until a balance is achieved and the water ceases to rise. If straws of different diameters are placed in the same glass, the water will rise higher in narrower straws than in wide ones because of the differences in surface tension.

Two types of tissues are involved in a plant's use of capillary action and attraction: xylem and phloem. Xylem is the woody tissue that provides support for the plant, much in the same way that skeletons provide support for animal bodies. The cells in xylem, through capillary action and attraction, absorb the water and minerals taken in by the roots and move them up to the leaves for photosynthesis. This process in turn creates the food material that is transported throughout the plant by the phloem tissues through capillary action and attraction.

In the bloodthorn, the phloem tissues connect directly with the plant's hollow thorns. When a successful strike is made by the plant, the liquid blood of the victim rises into the narrow opening of each thorn tip and is absorbed by the phloem cells. By devising a method of feeding directly on the already-dissolved nutrients in its victims' life fluids, the bloodthorn has bypassed the need to develop digestive glands like other carnivorous plants.

Some of the species of fantasy carnivorous plants have evolved forms of vegetable musculature similar to octopus tentacles (the giant pitcher plant being the most obvious example). This has allowed some plants, such as the giant sundew, to become mobile and so increase their chances of survival by allowing movement from one location to another as an environment becomes unsuitable for them.

The development of musculature in fantasy carnivorous plants presumes also the possible development of some form of nervous system. An increasingly complex nervous system allows the evolution of intelligence, such as typified by the semi-intelligent giant sundew. Intelligence is a survival trait; the greater a plant's intelligence, the greater its chance of continuing as a species. In AD&D game terms, such intelligence may rise high enough to permit the development of a moral sense and an alignment other than the neutrality typical of lower animals and plants.

Both the hangman tree and the black willow are, at present, the only carnivorous plants in the AD&D game universe that deviate from an absolutely neutral alignment.⁷ The tendency of both towards evil in their alignments may be due to the low level of intelligence ascribed to the plants (the black willow, though capable of possessing greater than average intelligence, does not use this intelligence to the

best advantage). Creatures of low intelligence that do not possess the wisdom to control their impulsive actions tend to act to satisfy their immediate desires without consideration for others. This lack of control can also hinder the efficient application of high intelligence.⁸

The hangman tree has sufficient intelligence to learn and speak the common tongue — albeit haltingly (a feat the black willow hasn't yet accomplished).⁹ Nevertheless, the deception abilities of both the hangman tree and the black willow are limited, with the hangman tree using hallucinatory perfume and the black willow using its aura of drowsiness). Neither plant uses even small treasure items as a lure, possibly because they themselves are uninterested in gold and the like. Even the killer mimic is smart enough to realize it has a better chance of attracting prey by disguising itself as some valuable object.

It is fortunate for adventurers that these trees, the highest forms of carnivorous plant presently known, are more cunning than clever; if it were otherwise, PCs might encounter these trees more often and more to their detriment. However, adventurers should be concerned by the hangman tree's development of magic resistance as a survival trait. If the trend towards greater intelligence in fantasy carnivorous plants continues, future species of carnivorous plants may very well use spells to hunt their prey.

Footnotes

1. Carnivorous plants, because they have retained their abilities to photosynthesize, can live a "meatless" existence; during these periods, however, their growth is slower than usual and may even be stunted. As a result, a carnivorous plant that has gone through some lean times may be only one-half to three-fourths normal size, with corresponding reductions in hit dice and damage.

2. AD&D game carnivorous plants may still be capable of reproducing this way through pollination via species of giant bees, wasps, and so forth, as well as via the normal smaller species of these insects. Seeds from carnivorous plants, though, are best harvested in the fall season. After the plant is destroyed, PCs may gather up to 2-20 seeds in perfect condition, undamaged by the battle. If PCs employ nonpoisonous means to subdue a plant peacefully, the number of useable seeds recoverable may be doubled.

3. In issue #89's version of the Venus' flytrap, the "teeth" that fringe the edges of the lobes act to trigger the trap and prevent the prey from escaping before the trap is fully closed.

4. Such a symbiotic relationship might

exist between the AD&D game's giant sundew (or other sessile carnivorous plants) and certain large insects or other creatures. These creature may lure prey within the plant's reach in exchange for scraps from the plant's feeding; they may also find a safe home with immunity from the plant's attack.

5. The giant pitcher plant may have retained the narcotic qualities of its nectar. Thus, those characters who fall prey to the plant may become unconscious from the fumes inside the plant's stomach. Characters should save vs. poison each round they are inside the plant. Failure results in unconsciousness lasting until the victim is either consumed or removed from the plant. In the latter case, the victim remains unconscious for an additional 1-6 turns. After regaining consciousness, the victim suffers slowed reactions for 3d10 rounds, with all attacks, defenses, reactions, and dexterity bonuses at -1.

6. Popular belief has it that certain real species of pitcher plants are able to close off the mouths of their traps with their hooded leaves, preventing victims from escaping. The giant pitcher plant may have evolved the ability to actually seal off its mouth opening. Characters who attempt to open these coverings must be able to brace themselves and successfully roll their *bend bars/lift gates* chances.

7. The zygom also deviates from absolute neutrality due to its evil nature, although it cannot be rated on a scale of intelligence. The zygom has been excluded from discussion for the latter reason. Furthermore, while the *Monster Manual II* states that the zygom prefers living flesh and blood for sustenance, it does not actually hunt prey. Instead, it lives a parasitic existence on any host body it finds.

8. Since both the black willow and the hangman tree are members of the plant kingdom, perhaps they cannot truly be judged by human standards. They prey on animals (including humans) for food just as many animals prey on plants for food. (Such relativistic hairsplitting is best left to philosophers and sages.)

9. One of the knotlike protuberances on the hangman tree which usually serves as a sensory organ for the tree may have evolved a primitive vocal apparatus. This may also explain the halting nature of the plant's speech, as the tree draws in and stores air in the knot, later expelling it in brief blasts of vocalization.

THE ECOLOGY OF THE CARRION CRAWLER

Crawlspaces

The Underdark is the
last place you want to
make a wrong turn.
You never know what
you might meet.

THE UNDERDARK CAVERN WAS COMPLETELY STILL and silent. Were there any illumination in that lightless cave, only one object of any interest would be seen: the rotting corpse of a hook horror, nine feet of insectoid monstrosity with a vulturelike head and sharp, curved hooks in place of hands.

The creature lay dead, its body covered in what appeared to be moist, juicy pustules, each the size of a small wineskin. Once the pustules began bursting open, however, their true nature became apparent, as wriggling larvae crawled forth.¹

Each larva looked like a large caterpillar, with a soft, pliant body about a foot long, an inchworm's knobby pseudolegs bunched together at the front and rear, a large head equipped with oversized black eyes and a complex mouth.² The grubs' bodies were still wet with the muck of their eggs when they began burrowing into the corpse of the decaying hook horror, devouring its flesh. Wet sounds emerged from the once-silent cavern as the grubs chewed their way deep into the corrupted flesh.

The hook horror was a massive creature, but there were scores of the hungry larvae, each focused on the single, all-consuming task of sating their ravenous hunger. They devoured the beast in less than a week.

Then they began devouring each other.³

"Ta-dah!" announced Shandrilla with a flourish, popping open the lock on the massive iron chest her gnomish companions had uncovered. The two gnomes crowded closer, eager to see what riches lay within.

Javorik the Bold, Illusionist Extraordinaire, personally hoped for a stockpile of magical items, maybe even a replacement for the wand of lightning he had recently lost to the strange pudding they had fought in these very corridors a few weeks ago. His cousin Federico had simpler tastes: gold and gems, the more the merrier.

"Well?" Federico demanded. "Open it, you silly human girl!"

Shandrilla gave the warrior a quick scowl in the torchlight, then turned her attention back to the chest. "I'll take the lock," she said, dropping the device into her thieving kit. The lock had been a real challenge to pick, and she wanted more time to study it in better light.

"Sure, sure, fine, fine," Federico agreed. "What'd we get?"

1. Female carrion crawlers lay their leathery eggs (about one hundred in a clutch) among carrion, providing their offspring with a ready source of food when they hatch. That is the extent of the parental care the female provides for her young, for the eggs are abandoned immediately after being laid and are even occasionally devoured by the mother or any other adult carrion crawler that discovers them.

2. Newborn carrion crawler larvae bite for a single point of damage, have ½ Hit Die, and strike with

a THAC0 of 20. Their soft bodies have an Armor Class of 9.

3. When the larvae chew their way out of their eggs (about a week after being laid), the newborn grubs immediately devour the adjacent carrion and often each other, falling into a feeding frenzy to rival those of sharks. Those grubs that avoid being eaten by their siblings are often devoured by an adult, for carrion crawlers enjoy the taste of their own young. As a result, few survive to adulthood.

L.A. Williams

The hook horror was a massive creature, but ... they devoured the beast in less than a week.

Shandrilla creaked open the lid of the weathered chest, then gasped in surprise. "Gentlemen," she said in an awed voice, "We. Are. RICH!" She scooped her hands deep into the pile of gold coins that nearly filled the chest, throwing them into the air in her exuberance.

Their hoots and hurrahs echoed eerily down the twisted corridors of the underground tunnel network.

The grub wriggled and squirmed out of its old skin. It emerged a larger version of its previous self, as it had after each of its previous molts. This was the creature's tenth molt in as many months; now its flexible body was nearly six feet long when fully extended.⁴

The grub had been one of the few of its brood to survive this long. Once the hook horror in their hatchery had been stripped to a mere exoskeleton, only the toughest and fiercest of the grubs had endured the cannibalistic frenzy that followed.

In the past several months, the grub had experienced a wide variety of new tastes: discarded spider husks, rotting lizard meat, the rank, decaying flesh of a small, horned humanoid creature. It had

even once chased down a fire beetle, nudging it onto its back and biting through its underside to reach the juicy flesh within.⁵

But those meals were long gone and of no use to the creature now; as always, the process of molting had made the grub ravenously hungry. It wriggled and inched its way down the Underdark corridor, seeking food—any food, living or dead.

"Well, that's it," said Javorik, dropping the last of the golden coins into Little Biggie, the bag of holding he had spread out on the cavern floor at his feet and into which the three had been chucking the contents of the treasure chest. Even though the chest had been far too big for the gnomes to carry, its contents fit easily into the small sack, thanks to its extra-dimensional magical properties. "We'll count it all and split it up when we get back, but I'd say there's easily several hundred, maybe even close to a thousand, each!"

"Beer money for a couple months, anyway!" chuckled Federico, rubbing his little hands together in glee.

"What about you, Shanny?" asked Javorik. "Got any plans for your share?"

Gonna look for a magical weapon or two? Some better armor? Or maybe spend it all on frilly dresses and gaudy jewelry? Gonna forget the life of an adventurer and find some good-looking man to settle down with?"

"Never you mind, gnome," answered the young thief, blushing, who honestly hadn't given it any thought. "Let's just get back up to the surface, and then we'll worry about spending it." Shandrilla glanced around at her surroundings in the flickering torchlight; why did she always seem to spend so much of her time traipsing around in rough-hewn tunnels deep under the earth? Gods knew she didn't enjoy being so far below the surface, where one simple earthquake could send tons of rock crashing down on her head. And the monsters! If she came across one more weird pudding, she'd scream ...

"I'm with her," agreed Federico. "The quicker we get back, the sooner I can quench this thirst of mine!"

"Oh, all right," said Javorik. "Let's go." He took a left and headed down the passageway. His cousin, though, had turned right and was heading the other way.

4. Carrion crawlers molt in the manner of many insects and reptiles, shedding the outer layer of skin as their bodies grow. Grubs begin life about 1 foot long and molt every month or so, adding approximately 6 inches with each molting. Each shedding of skin takes about a day.

When a carrion crawler grub reaches a length of about 6 feet, it metamorphosizes into its adult form. This process takes 5–7 days, after which it rips out of its old grub skin and emerges as a small adult. The

adult form looks rather like a cross between a giant green cutworm and a cephalopod, for the creature sports the eight flailing tentacles arranged in a horseshoe shape over its sharp mandibles that make the carrion crawler so distinctive. Instead of the soft, caterpillarlike pseudolegs of the grub form, the adult has twelve sets of insectile legs, six pairs toward the front of its body and six pairs at the rear.

The adult carrion crawler continues to grow, molting each month (and adding another 12 inches

with each molt) until reaching its full size of 9 feet long. Carrion crawlers have a 2-year lifespan, about half of which is spent as a full-sized adult.

5. As its name implies, a carrion crawler prefers a diet of dead, decaying flesh, but if carrion is unavailable the creature has no qualms against attacking living beings. As a result of their diet, carrion crawlers (and grubs) exude a constant stench of decay; this odor often gives others warning of the creature's approach. The DM should allow a +2 modifier to the

"Hey, just wait a minute, guys!" said Shandrilla. "Where are you going?"

"To the surface!" the gnomes said in unison, pointing in opposite directions.

"Oh great," said the young thief.

With a savage twist, the carrion crawler shook off the remains of its latest molting, letting the torn skin fall to the floor, and emerged for the first time in its adult stage.

While it still retained the basic form of its larval stage, there were several notable differences. The most noticeable were the eight tentacles sprouting from the front of the creature's head. These glistened with moisture and waved slowly back and forth as if responding to a secret breeze.⁶ The head itself had grown a chitinous layer of armor, making it harder and tougher than the rest of the creature's flexible body.⁷

As with all of its moltings, the creature emerged ravenously hungry—this time more so than normal, for the metamorphosis from larva to adult had taken much longer than its larval moltings. Skittering along the rock floor of the tunnel

network on two dozen newly developed legs, the carrion crawler eagerly searched for its next meal.

"I can't believe we're lost!" bemoaned Shandrilla. "You guys have been down here—what?—at least twice before!"

"Ah, but Shanny, you remember what a hassle it was finding our way down here in the first place! All of these tunnels start to look the same after awhile. Anyway, I'm certain the surface is this way."

"This way," corrected Federico, pointing in the opposite direction.

"No, it's this way," insisted Javorik. "Remember, there was that T-intersection where we took a right."

"That led to a dead end!" responded Federico.

"No, not that one! The one before then. First there was that squiggly bit, then the three lefts, then the right and the bit that sloped downhill..."

"Wait a minute. Three lefts is a right," pointed out Shandrilla.

"Only if they're all right angles," responded the illusionist, his prodigious nose in the air. "Remember, that last one just kind of veered off funny."

"Then that's a 'Y,' not a 'T,'" argued Federico.

"So?"

"So, you said 'the T-intersection,' not 'the Y-intersection.'"

"I wasn't talking about that one then! First there was the T-intersection, then the squiggly bit—"

"Wait a minute, I thought the squiggly bit came before the T-intersection."

Shandrilla sighed. "Javorik, just how certain are you that you know the way back to the surface?"

"Absolutely certain."

"How certain?"

"Okay, fairly certain."

Shandrilla crossed her arms and raised an eyebrow questioningly at her illusionist companion.

"Oh, all right then, just a slight little teensy tiny bit less than fairly certain."

Larvae

Grubs begin life about 1 foot long

Each molting takes about a day.

a group's roll to see if they are surprised when encountering a carrion crawler.

6. Carrion crawlers habitually wave their tentacles even when not attacking, for the tentacles are important sensory appendages, housing the creature's senses of touch, taste, and smell. In this aspect, they serve the same role as an insect's antennae.

Carrion crawlers also have keen senses of sight and hearing. They have two large, shiny multifaceted eyes well-equipped to pick up movement. The eyes also grant the creatures infravision to a range of 30 feet. Tiny hairs on their legs and body sense sound vibrations, providing the creature an acute sense of hearing.

7. The carrion crawler's hard, chitinous head plate grants that portion of its body a natural Armor Class of 3. The rest of its body is soft and fleshy like a caterpillar's, providing only AC 7.

8. Like many arthropods, carrion crawlers can walk along walls and ceilings at their full movement rate. They can also walk backward at full speed, a useful ability when they have crawled into a narrow dead-end tunnel.

9. A carrion crawler's primary attacks are with its

eight tentacles, each of which is covered in a sticky secretion that causes paralysis in those touched by even one of the appendages. A carrion crawler always goes after a single opponent at a time, never splitting its attacks between two or more foes. This means that the poor victim might have to roll up to eight successful saving throws vs. paralysis each round to prevent being immobilized for 2-12 turns! As might be expected, carrion crawlers are immune to the effects of their own tentacles and those of others of their race.

Being basically mindless, a carrion crawler attacks its enemies one at a time until they have all been paralyzed or fled the scene. The creature never checks morale, fighting to the death. Once no longer confronted by mobile enemies, the carrion crawler chooses a victim and begins eating, inflicting 1-2 points of damage per round with its sharp mandibles. A carrion crawler does not bite in combat; it paralyzes its prey first so that it can devour its helpless victim without interruption.

10. These holes are called spiracles, and they are the means by which the carrion crawler breathes. There are eighteen in all, nine on a side.

11. Carrion crawlers defy standard taxonomic classification. They are not insects, despite their many similarities to insects while in the larval stage. The closest approximation in the taxonomic system used by most human cultures would be phylum arthropoda, class myriapoda, putting the carrion crawler in the same general category as centipedes and millipedes.

There are differences, of course, primarily the carrion crawler's lack of antennae (present in all earthly myriapods) and the presence of the eight paralytic tentacles. Also, most myriapods have their multiple leg pairs spaced more or less evenly along their body lengths, while the carrion crawler's legs are bunched up in sets of twelve at the front and rear thirds of the creature's body.

The reason the carrion crawler differs so much from terrestrial creatures is that it is not native to the planet. It is instead believed to be a native to the home world of the illithids, or mind flayers, wherever that may be. Carrion crawlers not only share the same habitat as the illithids but also bear a ring of tentacles around the mouth much like the mind flayers (although mind flayers have only four tentacles).

tures who stood with weapons in hand.

It didn't hesitate but rushed toward the nearest foe, tentacles waving and mouthparts open wide in anticipation ...

"Hmm, that's funny," said Federico, staring at the solid wall of the dead end tunnel before them and scratching his chin in puzzlement.

"You'll notice I'm not laughing," said Shandrilla with a scowl.

The dwarf raised his shield up to the crawler as the thing attacked, its paralyzing tentacles flailing wildly, eager to embrace its intended prey. The dwarf brushed the tentacles aside with his

to move, his chanting stopped, as did his weapon blows. He fell over as soon as the creature released him, unable even to balance upright.

The other dwarf soon found himself facing a hungry and pain-crazed carrion crawler all alone. "Come on then, you stupid bug," he said between gritted teeth, hefting his weapon. The words were meaningless to the worm-monster, but the crawler was more than eager to comply ...

"Maybe we should try those stairs we passed," suggested Javorik.

"Those stairs went down," Shandrilla said. "We want up, not down."

"This way!" shouted Federico, drawing his short sword and leaping down the stairs three at a time.

shield and swung his warhammer in a vicious arc at the worm-creature's head. The weapon bounced off the carrion crawler's chitinous head plates.

At the same time, the other dwarf was methodically swinging his battle-ax right below the row of regularly spaced holes along the monster's side, spilling yellow blood from its soft body with each strike.¹⁰ The carrion crawler rose up on its hind legs and swung its flexible body around to strike at the ax-wielding dwarf. That one, chanting obliviously with each swing of his weapon like a smith singing at the forge, didn't even see the attack coming. One minute he was carving chunks of fatty flesh from the worm-monster's side; the next, he was engulfed in a writhing mass of tentacles that had dropped over his head. Suddenly unable

"Picky, picky."

"Shh— What was that?" Federico asked suddenly, hand raised in the air to stop his companions.

"What was what?" asked Javorik.

"Quiet!" hissed his cousin. The three adventurers stood silent and still, straining their ears. All Shandrilla could hear at first was the sputtering and hissing of the torch in her hand, but gradually she made out the sounds of metal striking stone, and the echoes of shouted curses. There was no doubt about it, the sounds were coming from the stairway leading farther down into the Underdark.

"This way!" shouted Federico, drawing his short sword and leaping down the stairs three at a time, no small feat for a gnome in plate mail. "They might need our help!"

"Oh, great," sighed Shandrilla.

This final prey was proving to be more difficult than the carrion crawler had anticipated. Although it was severely wounded and there were already two potential meals lying helplessly on the stone floor, the thought of snatching one up and fleeing back to its lair never occurred to the creature.¹² There was still an enemy to overcome and overcome him it would, or die trying.

This one was armored like a beetle, but it was quick like a lizard. The other two like it had been dispatched quickly, but surprise had been on the carrion crawler's side then; now it faced its enemy without such an advantage. The prey seemed to realize the danger posed by the monster's tentacles, for it hid behind its removable shell each time the creature attacked. The prey kept trying to flee from the monster's head and attack its unprotected flank, but the carrion crawler was too efficient a fighter to allow that to happen, and the cramped quarters of the narrow tunnel worked against the prey.

And then more prey arrived on the scene.

The first of the new prey seemed an even shorter version of one of these beetle-lizards, but the other two who followed farther behind lacked the shells and would be that much easier to chew ...

Shandrilla raced down the steps behind Federico, marveling at the speed of the gnomish warrior. Then her foot slipped out from under her, and she bounced down the last of the steps to land in an undignified heap.

"Shanny! You okay?" called Javorik, bounding up behind her as fast as his little legs would take him.

Most worlds inhabited by illithids also house carrion crawlers; it is believed the mind flayers actively raise them as they do amorphs, fungi, and other dangerous creatures. Further details on the relationship between carrion crawlers and illithids can be found in Stephen Inness' "The Sunset World" in *DRAGON Magazine* #150.

12. Carrion crawlers keep permanent underground lairs, venturing out every few days to search for food. When they discover a meal, they usually drag it back to the lair so they can devour it in relative safety. The two main exceptions to this policy are when the meal is too big to drag away (as when stumbling upon the corpse of a purple worm) or when the flesh is so rotten that it falls apart when moved. In the latter case, the carrion crawler devours its meal in place; in the former, it usually attempts to bite off a large chunk of flesh and drag

that portion back to its lair for consumption.

Since carrion crawlers customarily drag their prey back to their lairs, a crawler den is apt to include all sorts of incidental treasures, as typified by Treasure Type B. Coins, gems, and metallic objects are likely to be found intact (if scattered about), but most organic items (including those made of cloth or leather) are often partially eaten or rotting away.

13. Unbeknownst to Shandrilla, she's encountered the by-product of the carrion crawler method of reproduction. During the mating season, males deposit sticky blobs of spermatophores (usually around 20) along the surfaces they travel. Each blob is a small oval about as big around as a fist. If and when a female carrion crawler comes across such a blob, she picks it up in her tentacles and stores it in a special set of buccal pouches inside her mouth.

The process of storing spermatophores triggers egg production in the female. For the next several days, her body starts generating around 100 eggs, which are temporarily stored in her bloated abdomen. During this time, she hunts for an appropriate corpse of sufficient size to lay her eggs. When one has been found, she ejects the eggs through the genital orifice between the third and fourth pairs of her front legs, grasping each egg with her tentacles and placing it into position upon the carrion. The eggs are then fertilized by the sperm cells she's been storing inside her buccal cavities. The entire egg-laying process takes the better part of a day.

The female dies a few weeks after laying her clutch of eggs, exhausted from the effort. Immediately after laying her eggs and for the remainder of the short span of time left to her, her Movement rate drops to 3, and she suffers a -2 attack penalty.

The Anatomy of the Carrion Crawler

Carrion crawlers have keen senses of sight and hearing. They have two large, shiny multifaceted eyes well-equipped to pick up movement. The eyes also grant the creatures infravision to a range of 30 feet.

The creature's chitinous head plate gives it AC 3, while the rest of its body is soft, only AC 7.

The carrion crawler breathes through its spiracles.

Tiny hairs on the creature's body let it "hear" subtle vibrations in the air.

When rearing to attack Medium-or Large-sized creatures, carrion crawlers set their hindmost legs for balance.

The tentacles end of a carrion crawler are its most feared and infamous features. An unlucky foe might need to make up to eight successful saving throws per round.

Carrion crawlers often use their frontmost legs to carry away paralyzed prey.

He held his thumb and index finger a hair's-breadth apart to demonstrate.

"Lead on, Federico," said Shandrilla.

The carrion crawler clung motionless to the ceiling, listening intently.⁸ It had heard voices just a moment before—but where?

There, behind it! It did a quick U-turn on the ceiling and started racing toward the sound, its multiple pairs of legs rippling in wavelike unison with an almost hypnotic rhythm.

As the beast turned a corner, it received its first glimpse of its new prey: three small humanoid creatures stagger-

ing through the Underdark corridor under the bulky weight of their backpacks.

The trio carried metal lanterns and a wide assortment of weapons. Had the ravenous monster the intelligence to understand their language, it would have heard them exchanging opinions on the first bar they should hit when they got back to the surface, and which of the three would be able to drink the others under the table.

The carrion crawler therefore took them completely by surprise.

The creature dropped silently from the ceiling as they passed underneath, catching the rearmost creature with its tenta-

cles before the others were even aware of the crawler's presence. That one froze like a statue in mid-stride and toppled over onto his face, breaking his nose in the process.⁹ The carrion crawler scrambled over his still form in a beeline for the others.

The sound of the fallen creature's armor clattering on the stone floor gave the other two enough warning to evade the tentacled monster. Spinning around, they saw the monster barreling toward them and dove in opposite directions; the creature's tentacles swished through the air just above one's head. Then the crawler faced the remaining two crea-

"Fine, fine," replied the young thief between clenched teeth, rubbing a bruised knee and trying not to curse aloud. "Slipped in something.¹³ Go on, I'm fine."

Javorik sped on down the corridor in his cousin's wake, Shandrilla limping behind him.

When she caught up to the others, she gasped out loud at the sight before her. Shandrilla was a city girl, more accustomed to scaling high walls and sliding through the shadows of back alleys than slinking around in the bowels of the earth and fighting hideous monstrosities. The sight that greeted her made her blood run cold.

There in the corridor ahead was the biggest worm she'd ever seen. On closer inspection, she realized that it wasn't a true worm, for the creature reared up on its many hind legs and lunged at the dwarf immediately before it.¹⁴ Thick, yellow blood spilled freely down its side, but the abomination hardly seemed to notice. The dwarf raised its shield to ward off the creature, but the nightmarish monster grasped the edges of the shield with six or eight of its front claws and hoisted the dwarven warrior into the air. A cluster of vile-looking tentacles snaked out and slapped the dwarf in the face; the stout warrior fell silent. Then, as if no longer interested in its current victim, the worm-monster released him to plummet hard against the stone floor. The creature dropped its front half back down to the ground and set its sight on Federico, tentacles whipping back and forth.

Federico had raced into the corridor filled with bravado and battle-lust, but if Shandrilla was reading his body language correctly, he'd had an almost immediate change of heart. Fortunately, before he had the time to turn tail and flee, a barrage of magic missiles raced past his head and found their mark. The worm's front half crashed to the ground.

Its middle section arched up as the legs of the back half ran a couple extra steps before the creature toppled over in a tangled pile. By the time Shandrilla had hobbled up to the gnomes, the fell creature was lying on the floor, hideous, insectoid legs twitching spasmodically.

"Is he dead?" whispered the young thief, the blood drained from her face.

"I don't know," said Javorik. He went over to inspect the fallen dwarf. "He's breathing!" he called out.

her arms over her chest. "And I'm not a thief! I'm a recovery specialist."

Federico scowled up at the dwarf, hand on the hilt of his sword. He might have flinched at combat with an enormous killer worm, but he wasn't about to let some stupid dwarf push him or his friends around. "Look here, buddy, we just saved your miserable lives," he snarled. "I'd think you might be a bit grateful, rather than spitting out accusations."

The monster crashed into the warriors with a silence that seemed much creepier than if it had bellowed its defiance.

"There's more behind the monster!" pointed out Shandrilla. She was slinking along the wall of the tunnel, trying to slip past the dead worm-monster without brushing up against it.

She found a second dwarf lying on his back just past the creature, an axe gripped tightly in both hands as if in mid-swing. Bending over his body, she saw that he was breathing and that his eyes were wide open, but he stared sightlessly ahead at nothing and his hands were rigidly clenching his weapon as if his life depended upon keeping a firm grip. "Paralyzed," decided Shandrilla out loud.

There was a groan from farther down the corridor. Shandrilla saw another dwarf stumble to his feet, then look up at her. "Hey! Get away from him!" he cried.

Javorik and Federico heard the commotion and came running over. "Lousy thief!" snarled the dwarf, drawing a sword from his belt. "Trying to loot me friend, eh?"

"I was doing no such thing!" replied Shandrilla, indignant at the accusation. She stood at her full height and crossed

"I seen what I seen."

"Look," said Javorik, "Couldn't we settle this elsewhere? I don't know about you, but I for one feel kind of exposed out here. There's a chamber just down this corridor; maybe we could drag your pals in there until they come out of it? I don't really want to be standing out here in the open if another one of these big caterpillar-things shows up."¹⁵

"Hrrmph!" snorted the dwarf. "Ye lead the way, then, an' I'll do the draggin'. I don't want her near our loot."

Shandrilla turned to the ungrateful dwarf with a hot retort on her tongue, but screamed aloud instead. Another of the worm-monsters was barreling down the tunnel toward them.

"Shanny, get these two to safety!" ordered Javorik, readying another spell. "We'll hold off the critter!"

Shandrilla bent over the ax-wielding dwarf and started lugging him slowly down the corridor, toward the dead beast still oozing yellowish blood onto the tunnel floor. Gods, but the dwarf weighed a ton! Why did she always seem to end up dragging unconscious or

14. A carrion crawler often rears up on its hindmost twelve legs when attacking Medium-sized or larger creatures. This puts its body at about the same height as a human, making successful attacks more likely. Once its prey has been slain, it often carries the corpse slung under its upper body, holding it tightly with its twelve front legs, while walking back to its lair on its hind legs. Otherwise, the carrion crawler walks on all twenty-four legs, keeping its flexible

body relatively flat. (It stands about 4 feet high when doing so.)

15. Although normally solitary creatures, several carrion crawlers can be found in the same area and even sharing the same lair, so long as food remains plentiful. No more than six of the monsters have ever been encountered together, and even this is highly unusual.

Even when encountered in numbers, carrion

crawlers do not cooperate; each attacks its own opponents and moves on until all potential prey has been paralyzed or fled. In the event of a single victim and two or more carrion crawlers, the crawlers immediately attack each other as soon as the prey has been immobilized, often fighting to the death. Since carrion crawlers cannot paralyze each other and their mandibles inflict only 1-2 points of damage, a battle between two carrion crawlers can take

paralyzed armor-clad adventurers down Underdark passageways? Last time it was Federico, and he weighed even more than Shandrilla had imagined.

Javorik was out of magic missiles; instead, he threw up an illusionary wall in front of the rampaging beast. It might have slowed it down momentarily, but it was hard to tell. The monster popped right through the phony wall and continued its charge.¹⁶

Federico and the dwarf stepped up, swords drawn, ready to engage the beast. "You go right; I'll take left," said the gnome. "And watch those tentacles."

The monster crashed into the warriors with a silence that seemed much creepier than if it had bellowed its defiance.¹⁷ They ducked and parted ways, swords poking up at the beast as it struck. The dwarf was hit on the back by a tentacle, but it struck only armor and had no effect.

Javorik, meanwhile, was struggling to find another useful spell in his inventory. Spook had had no effect. Several other of his choice spells he dared not use for fear of affecting his companions as well.

As much as he viewed magic missile as a crass and unimaginative spell, what he wouldn't give to have memorized a few more of them!

quite some time. (If the intended prey is lucky, the effects of the paralyzation might wear off, allowing a chance to make a break for it while the two would-be devourers hash it out!)

16. The carrion crawler relies predominantly upon its senses of sight and smell. For an illusion to be effective against such a creature, it should have both visual and olfactory components.

17. Carrion crawlers make no vocalizations; usually the only sound they make is the scratching of their many claws on stone.

Federico managed to stab into the worm-monster's side between two of its legs. He was rewarded with a spurt of thick yellow blood and the creature's undivided attention. Twisting its malleable body to face the little gnome, it slammed all eight grasping tentacles in his direction. Federico didn't have a chance fighting off eight attacks at once, especially when each tentacle was nearly as long as he was tall. He went rigid and was out of the fight.

"Oh, what the hell," muttered Javorik, casting a mirror image upon himself. Soon after, seven identical Javoriks went screaming down the corridor, daggers in hand.

Shandrilla watched all of this with mounting horror. With Federico down, they had lost half of their combat power.

She didn't think Javorik would last long armed with only a dagger and a handful of fake duplicates. That left only the dwarf, and if he couldn't handle it, herself. It was a shame these other two dwarven warriors were still paralyzed; they could use all the help they could get.

And then, looking down at the dwarves at her feet, she got an idea.

Javorik and the dwarf had been stabbing at the creature, opening several wounds in its flanks. As was common with the mirror image spell, it was hard to keep track of which Javorik was which, for they shifted around so much it soon became impossible to track any one image's movements. This apparently held true for the creature as well, for it attacked three false images in a row, popping them like soap bubbles with its tentacles.

In the heat of battle, fighting for his life against a smelly, tentacled beast from the bowels of the earth, and with a crazy illusionist going stab-crazy all around him (he half expected to get stabbed himself amid the frenzy), the dwarf caught sight of the little human

thief down the corridor alone with his friends' helpless bodies, down by the slain monster. Confound it if she wasn't looting them of their hard-fought treasures. Blasted thieves! You couldn't turn your backs on them for an instant.

Of course, when fighting for your life against a carrion crawler, it's generally not a good idea to turn your back on it, either. The creature swung its body onto the distracted dwarf and wrapped its tentacles around his face. He fell to the ground with a litany of dwarven curses unspoken on his tongue.

But by then Shandrilla was ready. Wearing not one but two dwarven backpacks, each crammed near to bursting with loot, she hobbled awkwardly down the corridor, shouting at the top of her lungs.

"COME AND GET ME, UGLY!"

Even Javorik was shocked. He and his remaining two mirror images froze up and looked questioningly at each other. The silly human girl wasn't even holding her weapon! What was she thinking?

That didn't seem to bother the worm-monster, however; it struck out at her with tentacles spread wide to cover the greatest area. Stifling a scream, Shandrilla leapt into the tentacles' embrace.

She figured she had only a few seconds before the paralyzation kicked in, and put those few final moments of movement to good use. As a tingling sensation swept down her arms and throughout her body, Shandrilla wound her arms around as many tentacles as she could, gripping down hard on them with her hands and even biting down on one that happened to be right in front of her face. This had better work, she thought as all conscious movement was taken from her.

It did. Javorik and his two mirror images looked on as the creature's head was tugged to the floor of the tunnel under the weight of one slim girl and two overloaded packs. The mon-

18. Severed tentacles can be sold to an alchemist, for when properly boiled, the essence thus distilled can be fashioned into a potion protecting the imbiber from all forms of paralysis (including that of ghouls, ghosts, and various other undead creatures) for 1d10+2 turns. Optionally, an alchemist can craft a potion that paralyzes the drinker for 2d6 turns. (This is often the unintended result of a poorly made batch of the potion mentioned above.) Finally, carrion crawler tentacle essence can be used to fashion a gummy ointment that, if spread lavishly over a pair

of gloves, allows the wearer to paralyze other living beings for 1d8 turns by touch. The ointment generally wears off after 2-5 uses or 1d4+2 hours, whichever comes first. Of course, those foolish enough to try applying the ointment directly on their own hands usually end up paralyzing themselves.

Details on the uses of carrion crawler essence can be found on page 91 of the RAVENLOFT® campaign supplement *Lands of Darkness*.

ster worm thrashed around but was unable to extricate its tentacles. "Like spearing fish in a barrel," commented the illusionist to his nearest duplicate, as they simultaneously carved their way into the creature's body with their slim daggers.

Movement returned slowly to Shandrilla; as the last one paralyzed by the creature, she was also the last one to regain full movement. She sat up weakly and trembled.

"You okay, Shanny?" asked Javorik, obviously concerned for his human friend. He was covered nearly head to toe in sticky yellow blood. "We had to cut off a couple of that thing's tentacles to get you out from it."

Now that Shandrilla was able to move again, she found herself shivering

uncontrollably with the worst case of the heebie-jeebies she'd even known in her life. "I can't believe I really did that!" she said, scraping worm-slime from her tongue.

Three dwarves approached her, shame on their faces. "Uh, yeah. Us either," said one.

"Bravest thing I ever seen," commented another.

"Look, about what I said earlier ..." began the third, scratching the back of his head in embarrassment.

"Forget about it," said Shandrilla with a wave of her hand. "I'll consider us even if you guys can get us out of here and back up to the surface."

"No problem!" said the first dwarf. "Right up these stairs, down to the left, a quick T-intersection to the right, a squiggly bit, up a slope—"

"Wait a minute," interrupted the second dwarf. "I thought it was a Y-intersection."

"Didn't the squiggly bit come before the intersection?" asked the third.

"Oh, great," said Shandrilla.

Whenever Johnathan M. Richards researches an "Ecology" article, he is astounded by the vast complexity of the animal world. In this case, carrion crawler reproduction was taken directly from the Scutigera, a species of earthly myriapod. Once again, Johnathan's copy of The Illustrated Encyclopedia of the Animal Kingdom comes through!

MIND FLAYERS

The ecology of the

by Chris Elliott and Richard Edwards

The debate about the nature of the catoblepas did not keep the proverbial man in the street awake at night, but it had for generations added fuel (as if fuel were needed) to the intense rivalry between the Wizards' and Naturalists' Guilds of To-Zen. The problem was one of demarcation. The naturalists could not deny that there were creatures of magic, and magicians could not help but admit that nature could at times achieve feats worthy of any wizard — but each side naturally wanted to claim the most bizarre beast for its own. And when it came to bizarre, the catoblepas certainly qualified.

To the wizards, a beast with the body of a buffalo, a huge tail and neck, the head of a warthog, and a gaze that slew was clearly a magical beast, and they bitterly rejected the jibe of the naturalists that such a beast, magical or not, would strangle on its own contradictions. The beasts had been seen, said the wizards, which proved that they existed, but any observer rash enough to meet the gaze of a catoblepas died instantly — and what more proof did one need of the beast's magical origin?

Fair enough, said the naturalists, but they pointed out that the catoblepas had been sighted in groups. So, how did they

avoid killing each other — or themselves, for that matter — with their death-ray gaze? And how, in the name of the Mnoren, did they breed?

A magical creature, the wizards patiently explained, wouldn't need to breed, would it?

All right, retorted the naturalists, then how come there are so many of them? Is some deranged thaumaturgist turning them out as an occupation?

And so the debate continued, with each side having enough evidence to support its unshakable conviction that *it* was right, but neither having proof conclusive enough to convince the other side.

On one particular night, earth-shattering revelations were promised when the naturalist Bel-Ami, newly returned from an expedition to study the creature, was to address a capacity crowd in the Alchemists' Guild Hall, chosen as neutral territory. Inside the ancient vaulted hall, with its roof blackened by the fumes of countless demonstrations and its air pervaded by the sour reek of brimstone, the audience fell into three very different groups:

On one side of the hall were tight knots of black-robed apprentices surrounding splendidly gowned master sorcerers; hard-faced wizards, many in elaborately chased

leather and silver armor; and a scattering of commercial-minded wizards and wizardly priests preserving a dignified silence. On the other side were the naturalists, dressed in all shades of brown and green, accompanied by almost as many tame hawks, hounds, birds and dragonets. And all around the upper gallery was crowded a mob of curious citizens, eagerly speculating on the outcome of the evening.

Suddenly, as if on a signal, silence fell over the hall. Bel-Ami, a stocky, bearded man in a curiously patterned green robe, came in from the side entrance leading an extraordinary creature. The height of a man, it shuffled nervously on its huge back legs and muscular tail, whilst its small forepaws twitched agitatedly and its delicate head swung this way and that, eyes, ears and nose straining in all directions.

"I expect you're all wondering what this little fellow is doing here," said the famous naturalist. "Well, after much patient and often dangerous observation in some of the wildest country in To-Zen, I can reveal that, far from being just another grazing animal, as we had formerly thought, this is a *male catoblepas*!" This remark immediately prompted a general uproar in the hall.

Catoblepas

(or, looks can be very deceiving)

"No, please — please relax! — no, he's perfectly safe, but he does hold the key to the mystery. You must all have read the classic description of, as we call it, the 'cat' in the Bestiary of Xygag, although how he worked out that its eyes are 'bloodshot' escapes me, and for a beast 'horrible beyonde alle description' he goes into a fair amount of detail!

"Well, as far as he goes, he's right, but he didn't realize that they were only the female of the species. From my studies, I have established that the female is a large omnivore, feeding mostly on ooze and water plants dredged from the swamps it lives in, but gaining an important part of its diet from animals it has killed. And no, she doesn't kill them with her deadly gaze, but with her *breath!*

"The female catoblepas secretes a gas, deadly to anything except the female catoblepas, that is belched out in an invisible cloud. The effective range is only about sixty feet before it disperses, but within that range, the only chance of escape is to run faster than the cloud expands. The gas is equally deadly if breathed in or absorbed through the skin.

"It was obvious from the time that I started to form this hypothesis that the 'cat' was immune to its own poison, but it was not for a long time afterward that I

connected the female catoblepas with the small herds of grazers that were always found in the same area, following at a discreet distance, and realized that they were two forms of the same species!

"The male, poor fellow, is not immune to the poison cloud, and normally keeps well clear of the female. But in the mating season, the female exudes a scent which drives the male wild with a lust that frequently overpowers his instinct for self-preservation. He must try to wait until a solitary female is feeding with her head buried in the ooze of the swamp. Then, sprinting up to her, he dodges the heavy tail normally used as a defense, mates very quickly, and sprints off again.

"Six months later, the small, deer-like young are born. Since they are exposed to mild doses of the toxin before birth, they are immune to it. They are all weaned together, but at the end of the first year something very strange happens. The young scatter, and differentiate into sexes — a minority of females which remain immune to the toxin that they have begun to secrete, becoming fatter and thicker and eating flesh as well as plants; and the males, which undergo a radical change in their body chemistry, losing their immunity to the toxin and becoming fast-moving herbivores.

"As yet I can only speculate on the reasons for this division of the species; it may ensure a fitter breeding stock, or allow better use of existing food resources than the more conventional way, or both, or neither. Anyhow, enough talk. I'm open to questions from the floor."

During the course of his speech, all the magicians in the audience had been growing more and more restless. Now, one of their number burst from the audience with a horrified cry.

"You can't be serious! This must be your warped naturalist's idea of a joke!"

"Never more serious, I assure you," responded Bel-Ami.

"But, this is awful! When we heard that you had an astounding revelation in store for tonight, we were going to upstage you. My apprentices have gone out on an expedition to kill a catoblepas and bring it back as proof of its magical nature."

"That's quite possible. They can be killed."

"I know that, and you know that — but how far are they going to get with a polished shield?!"⁸

(An earlier version of this article appeared in *Dragonlords — Yet Another Fantasy & Sci-Fi Roleplaying Magazine*.)

The Ecology of the Cave Fisher

Humans are its favorite catch

Arlach cursed as the flickering torch stub burned his fingers. He dropped it on the cavern floor and lit a new one from the dying flames. It was just one more annoyance on this wretched adventure.

He checked his remaining torches. Three left. He had spent an entire day exploring these tunnels, and he had found nothing but animal droppings and torch stubs — many, many torch stubs. These caverns were well explored, indeed. He could imagine the jeering laughter he would hear if he came out empty handed. But he would show them! He would show them all!

He had to, now.

Arlach sat down heavily on a nearby rock and pulled the map from his pouch. The Caverns of Gold Light, he read at the top. A bitter joke. Seventy gold autorachs just for a copy of this damned thing. But the map's name had promised treasure beyond all imagining. He had spent the last of his inheritance on this accursed map and the equipment to make the journey: his armor, horse, sword, torches, food, and waterskins. But everything had gone wrong from the very beginning. His armor rusted, his horse went lame, and half of his food rotted before he even reached the little village near these caverns. The only real shop in the whole hamlet was the stable, though it was full of fine horses for decent prices. Arlach decided to buy one when he finally found the treasure, when he could laugh in the face of the innkeeper just as the innkeeper had laughed in Arlach's.

"Perchance, could you direct me to the Caverns of Gold Light?" Arlach had asked him, knowing no better.

The innkeeper had roared with mirth. "No, can't say that I've ever heard of them! Unless you mean the Caverns of *Cold* Light, eh?" The entire tavern had joined the innkeeper in his laughter. Arlach's face reddened at the memory.

Arlach cursed and kicked at a patch of the slightly luminous fungus that grew all along the cavern walls, giving the place its true name. Without wanting to do so, Arlach looked closely at the map once again and saw where someone had altered the letter "C" to make it appear to be a "G." Sucker bait. He had been a fool not to have seen it before he'd started out, but he couldn't back out now. There was nothing left to do. Wearily, he clambered to his feet and began walking down the tunnel.

There, what was that? Arlach peered ahead into the dimly lit darkness. Was that a glint of gold up ahead? His depression forgotten, Arlach hurried forward and dropped to his knees in front of a pile of equipment and armor. He pawed through it. The gold was a brass buckle. Nothing of value here but three silver denari — and a leatherbound book. Arlach held the torch high in one hand and opened the book with the other. The script was surprisingly large and sloppy, but it was literate. A diary . . . He flipped to the last entry.

I now write this testament not for my own salvation, but as a warning to others who come this way. If you find this book,

take it out with you. You are in the gravest danger.

I have spent three days, as nearly as I can determine, in this sunless dungeon. In that time I have learned much of the creature that holds me prey — a cave fisher. I have heard little more than tavern rumors of these creatures. What I have heard gives me little hope; what I have seen gives me less.

There are two of these creatures: one that holds me and another on the far wall. The one that has me also captured Gastron and Marb; the one across the tunnel caught nimble Desell. Almost as soon as we were snared, Marb was butchered and eaten. His armor was stripped away like a corn husk by the monster's claws while he struggled and screamed, then it cut off his limbs and are him in pieces, devouring even his bones. The other fisher consumed Desell at the same rime, his shrieks of agony ringing in my ears. The fisher that caught me left myself and Gastron in its strands, securing us to the ledge on

either side of it. By chance, it left one of my arms free. It does me little good. Although I retained my dagger, I cannot cut through the strands. I can at least write this message by this living light.

Many long hours after our capture, the creature devoured Gastron. First, the monster dissolved his bindings with a liquid discharged through its snout. Gastron attempted to defend himself, but the creature dismembered my friend with the same ease as it had Marb. I watched him die. I know that I am cursed to be the last.

You who read this beware: Make no sound as you leave this area. I have discovered that the creature is blind. The great membranes that appear to be the cave fisher's eyes are actually ears. If I move my free arm as if to throw something at the creature, it makes no response — yet my pen scratches on this page agitate it. Were I to rap my knuckles on the ledge, I fear it would attack me. The one across the tunnel seems able to unerringly capture bats; perhaps it can hear the high-

pitched cries they are reported by wizards to make.

I have noticed that these fishers have piled the gear from my dead comrades beneath them in the tunnel, as if they realize that such materials will attract prey. This indicates a greater intelligence than I have heard rumored of them, although it may simply be coincidence.

The last matter I must relay to you involves the possibility of escape. When Gastron was fighting the creature, he scored a blow on its head. The blood that dripped down fell upon his remaining bonds and dissol—

Arlach cursed as a glowing spark from the torch landed on his fingers. The torch dropped from his hand, hit the ground, and went out. Complete darkness fell. Continuing to swear, Arlach felt for his pack and began to rummage for his flint and tinder. He never felt the strand fall across his back until, with a startled cry, he was snatched off of his feet.

As the elf inspected the horse, the pudgy innkeeper rambled about its merits. "Yes, sir! That's one fine horse — a trifle lame, true, but that will pass in a few days. Besides, look at the price! Fifteen autorachs! You can't beat the price!"

The elf considered the offer in silence. Settling back to wait, the innkeeper reflected that maybe two days was too soon to be selling the boy's horse. But he had a buyer now, and the boy wasn't coming back. Young, cocky, treasure-happy — his kind never came back. It was not meant for regular folk to know what sorts of things lurked in caves and such. Why adventurers wanted to know, the innkeeper would never understand. Not that it mattered. Fools rushed in—

"I'll offer you eight autorachs," the elf said softly. "This poor creature is worth no more than that"

The innkeeper sighed, returning his thoughts to the matter at hand. "You drive a hard bargain, but for ten, I'll throw in an almost-new saddle. How 'bout it?"

Notes

The "eyes" of a cave fisher are actually multiple ears that allow it to capture its prey in the darkness with a high degree of accuracy. Because of this method of locating its prey, the cave fisher receives a bonus to hit when striking particularly noisy prey. Give the cave fisher a +2 bonus to hit against characters in metal armor or those who are talking. Give the fisher +1 to hit against characters performing less noisy actions such as carrying bags of coins or walking on hard ground. A thief (or an elf or halfling without metallic armor, attempting to surprise) may go unnoticed by a cave fisher if he can move silently; if he fails this roll, the cave fisher still has a -2 to hit due to the character's assumedly reduced noise. Tapping on the ground with a pole ahead of the party may induce a cave fisher to catch the pole instead (treat as AC 10).

The cave fisher's ears may hear sounds both below and above the human hearing range. Cave fishers often use this skill to catch bats flying nearby. If a cave fisher is presented with a number of different sounds associated with prey, it will fire at the loudest first; thus, it would choose an ogre in nailed boots over a nearby bare-foot halfling. Casting a *silence* 15' radius spell on a cave fisher causes it to freeze, making claw attacks at -4 to hit if it is

attacked.

When the cave fisher captures more prey than it can eat, it stores the "extras" in a manner similar to a spider's. It wraps the prey in adhesive filaments, almost always tying down all of a victim's limbs. The fisher then uses its adhesive secretions to secure the victim to a wall or ledge nearby. When the creature desires to eat, it simply dissolves the bonds of the victim and dismembers him (this can lead to some interesting rescue scenarios). The cave fisher can survive on very little food, even a few bats a day if need be, but when there is a surplus available it can consume up to 200 lbs. of meat per day.

The filaments, the adhesive secretion, and the dissolving secretion are all discharged through the creature's proboscis. The filaments are stored in the organic winch behind the creature's head; the two secretions are stored in frontal cavities. Once removed from a cavity, the adhesive hardens within one turn. The dissolving secretion takes one round to work.

Cave fishers can live over 100 years. Once every 20 years, the female makes a high-pitched keening sound (above human or demi-human hearing) that brings all males within a 5-20 mile radius underground. The female mates with the first male to arrive, then kills him, rejecting the overtures of all others. Three days later,

she lays a group of 5-9 eggs inside her mate's body and moves to a new spot. The eggs hatch within a month, and the young live for a short time on the carcass of their father. Three weeks after they are born, the young cave fishers are half grown, and they leave to establish lairs of their own. These half-grown cave fishers do half damage and 1+1 HD, but their armor class and movement remain the same. The young cave fishers reach full growth roughly one year after they are born.

Cave-fisher eggs 10 days old or less are greatly prized because of their high alcohol content, though they also contain other druglike substances. A single sip of the liquid found within the cave-fisher egg is enough to intoxicate a man for hours, bringing great delusions and hallucinations (save vs. poison or be confused for 1-4 hours; victim is merely *slowed* if he saves). Drinking an entire egg would be enough to kill a man (save vs. poison or die in 10-40 rounds). These fresh eggs bring 50-100 gp each in large cities. Neither the cave fisher's blood nor eggs older than 10 days have this property.

Cave-fisher lairs may have a large pile of equipment and treasure lying directly beneath them on a tunnel floor. Being semi-intelligent, the cave fisher is able to reason that this seems to attract prey, but it is not capable of more detailed planning. Ω

Ecology of the CENTAUR

Horse Raiders without Mercy

By Wolfgang Baur

Art by Joanna Barnum and Kathy Barker

The bow was impossibly thick: made of layered yew and horn, decorated with an ebony handle, and strung with a tiger-striped bowstring wound of horsehair as thick as a reed. The Rothenian elf pulled on it again to string it and barely bent the tips of the bow.

"It's not made for two-legs," rumbled Atropos. "It takes a real archer to string a steppe bow." Taking the bow back from the elf, the centaur stepped through the string, leaning 1,000 pounds of muscle and bone into the recurved spring, and grunted. Slowly, the wood bent beneath

his huge hands and the half-horse affixed the string. "Shoot for distance?" asked the centaur.

The elf stared and then laughed. "Your bow is bigger than mine; I confess it. But I still think you smell bad." The centaur smiled and pulled an arrow from his quiver, fully four feet long.

Centaurs are strange, half-human wanderers with no home or nation. On the Rothenian plains, they are friends and rivals to the elves, half-foolish and half-wise when moved by drink or rage. The centaur clans are small, sometimes of little more than a dozen or so, and all too often, they serve as mercenaries, fighting someone

else's war for little more than oats and cheese. When roused to anger, though, they burn out entire villages and sack small towns, before returning to the great plains, richer and avenged.

There, out in the extensive grasslands far to the east of Zobeck and high in the hills, the larger bands of centaurs make their own lives as hunters, bandits, and nomads, owing fealty to no one and nothing—fiercely independent, willing to die rather than be settled in any village, serving only their chiefs and khans. Humans and elves do not understand the centaurs' nomadic ways and fear their violent tempers and wild passions. Centaurs think humans and elves are fools to live in huts of wood or stone when they could live free while moving across the great grasslands. These horsefolk would not—could not—live any other way.

History of the Centaurs

The origins of the centaurs are unclear; they can claim many fathers. Most centaur priests near civilized lands claim their people were born of divine will and favor. Or perhaps it was Perun the Thunderer, who watches over the nomads of the great eastern steppes where the Rothenian elves claim dominion over the riverbeds and plateaus and where the centaurs rule the grasslands beneath their hooves from the Ruby Sea to the borders of Trollheim.

The centaur legends themselves claim that they are the true sons and daughters of the wind and sky gods and that both humans and horses are their lesser cousins. According to this tale, humans were made first, but their two legs and small size marked them out as runts and weaklings, and they were ultimately rejected by Perun as too slow and too weak to survive a nomad's life. Horses were the god's second attempt: fast and strong and able to live by grazing anywhere on the wide plains. But in time, their failings were clear as well, for they moved as a herd. The horses bred not heroes but followers, and lacked the cunning of a hunter and the clever hands of a smith or archer.

Mocked by his wife for failing twice, Perun the Thunderer decided to make the third time count for all, and he saw that the previous failings could be mended with the right match of human hands and equine speed and power, so the centaurs were his third attempt at making a race to rule the grasslands. This is a story they tend to keep to themselves most of the time but which they all believe in their hearts to be entirely true.

The stories that centaurs tell more freely are the tales of their arrival from the East, riding and pillaging along the hills to the River Argent, where they first met the ambassadors of the Court of the Shadow Fey. Unwilling to fight the fey in the dark forests and warned of disaster by the priests of Perun if they failed to carve out a home for themselves, many of the centaurs took to roaming a very particular set of pastures and grasslands.

The centaurs are true nomads, retreating to hills and Rothenian high meadows in summer and returning to lower elevations when the meadows are bare and the lure of rustling, banditry, and raiding grow strong. They are currently divided into those who live free in the Eastern grasslands and those who hunt and serve as mercenaries in human lands.

Centaur Medicine

Centaurs have a long tradition of healing and medicine, derived from both herbal and divine sources. This medicine is mostly meant for horses and centaurs and is remarkable in its ability to save even abused horses from the brink of starvation, strangles, or spongy hoof.

The centaurs dose themselves with the painkilling, hypnotic ridegrass before long journeys when a courier must travel without pauses for food or sleep. Ridegrass seems to have no effect whatever on two-legged creatures, though horses, mules, oxen, griffons, hippogriffs, and pegasi can all benefit from it, gaining a +4 bonus to Endurance checks for a day after consuming it.

Centaur medicine also extends to draughts for sleeping, poultices for healing both plagues and poison, and cures for curing impotence. The last of these, they claim, is made with centaur blood to help the two-legged, for "centaurs never suffer from this condition."

The only diseases they cannot cure in themselves or in horses are rabies and lycanthropy. Centaur healers are experts at the treatment of lycanthropy in its various forms, and though they cannot cure it, they can moderate the frequency and length of such shape-shifting and prevent the need to feed on fresh blood and flesh.

Centaur Grooms and Riders

Centaurs attract attention as mounts because of their resemblance to horses, but this is deceptive. Most centaurs consider it a bit presumptuous to even be asked to carry a rider, though the question comes up often. Asking a centaur to ride on her back requires a

Table: Centaur Lore

Characters with some knowledge of nature can learn more about the centaur. When a character makes a successful skill check, reveal the following lore, including the information from lower DCs.

Nature DC	Result
10	Centaurs have the strengths of both human and horse, and live in nomadic clans.
15	Centaurs use lances and enormous composite bows and can trample foes underfoot with ease. They are surprisingly good at stealth and woodcraft for their size.
20	Centaurs worship nature gods, a thunder god, and the god of wine. They are terrible, violent drunks and are much stronger than a typical human, able to tear apart small foes.
25	Centaurs fear confined spaces and steep slopes; they cannot climb walls or cliffs, and even stairs are difficult. They rarely enter towns, preferring the open road. They make excellent mercenary scouts.

successful opposed Diplomacy check; if it fails, that centaur will not give the presumptuous two-legs a ride under any but life-threatening circumstances.

The major exception to this is the centaur paladin and certain knights, who deliberately take on human or halfling riders to help them with weapons, armor, and horseshoes—not to mention stairs and ladders. When a centaur paladin reaches 5th level, he may summon such a groom. The groom is a 2nd-level fighter, and in many cases is mute or at least unobtrusive. Halflings are especially prized as grooms, as they weigh less and require less fodder than a human groom.

Anatomy and Appearance

Centaurs' human halves tend to be well muscled and longhaired with a bit

of a mane down their spine that fuses with their equine half. As half-horse, they come in all the colors and varieties of horseflesh, from bays and blacks to chestnuts and grays. Even zebra-centaurs have been reported on wide savannahs.

Centaur are unlike their horse cousins in that they are omnivores and hunters, rather than herbivores and herd animals. Nevertheless, they rarely eat much meat (and never horseflesh). Centaur prefer vegetables, roots, nuts, and (most of all) grains, such as rye, oats, and millet. They eat spring lambs and slow-cooked stews on major occasions, such as victories in battle and the marriages between major bloodlines of their chiefs.

Centaur human halves are deeply muscled, but their faces are not quite human; they are long and horselike, with large and flaring nostrils that permit breathing deeply in a gallop. The human torso is almost entirely lungs; the large livers and the multi-chambered stomachs and intestines are contained in the equine portion of their body. Their enormous hearts lie between the two, somewhat forward from their position in a horse, and often protected by a "belly band" of typically centaur armor.

Both centaur men and women typically have a mane of black hair running down their back as well as a crop of human hair. Their horse bodies have a variety of coloring, though they run to dun and chestnut on the Rothenian plains, and more black and greys in the forests near Zobeck and the Arbonesse.

Centaur live for 35 to 60 years, at which point they can no longer roam with their families. Elder centaurs tend to die on their feet, collapsing along the line of march. A clan may sit with a dying elder for days, striving to make their passing peaceful. Centaur burials on the plains are a matter of cutting the thick sod into grass bricks, then stacking them around a fallen centaur warrior or matron in a cairn. The size of the mound built around a centaur bears some relationship to the clan's love and respect for that centaur. Winter burials are perforce limited to mounds of snow when the steppe is frozen.

Magic & Equipment

Centaur magic is druidic, and they are powerful followers of both martial and earthy traditions. While a few centaurs thrive as merchants, ever practical in trading among the clans, most males are warriors first, and female centaurs

are rarely seen outside the circles of a clan group. Centaur goods are the goods of nomads: lightweight and few in number. The heaviest goods of a centaur clan are the winter tents, heavy cloth panels that can be rigged with any stout wooden pole to create a shelter for young foals and centaur women.

Clothing: Centaur garments are simple: a harness for weaponry and wineskins and a travelling pack slung over the back (never called saddlebags). In times of war, they wear leather armor and iron helmets but little else. Some clans wear colorful woven vests and long cloaks, but these are primarily for winter and the rainy season. Centaur women frequently wear sashes that cover one breast, a tradition they claim to have taught to the Amazons.

Horseshoes: Centaur hooves are small and tough. Some wear spiked horseshoes in battle but rarely wear them for travel. In cities, they prefer felt hoof coverings on stony streets.

Steppe Lances: These Large reach 2 lances are unusual only in that they are decorated with banners and tassels. The tassels for the deadliest warriors are the scalps and shrunken heads of their defeated foes. Centaurs use their lances primarily for the charge, and then, they trample foes.

Nomad Bows: These 7- or 8-foot long, recurved composite bows are meant for use by centaurs; almost no one else can make them, and finding one anywhere but in centaur hands is cause for a fight with any clan that sees it. They are made of layered woods, sinew, and horn and have a draw of at least 200 pounds.

For this reason, they have exceptional range and penetrating power, making them able to punch through even the thickest armor.

These horse bows have a 30/60 range and damage of 1d12 plus Strength

modifier. However, stringing one requires a Strength of at least 18, and the bow is too large for any size Small creature to use. Size Medium creatures suffer a -5 equipment penalty with a weapon too large for them.

A well-made nomad bow never sells for less than 1,000 gp, and most have names and histories from their makers and wielders. A stolen bow with a long history may often be recognized by other centaurs who see it in the hands of a non-centaur.

Livestock, Tents, and Campsites:

Centaurs measure wealth in goats and sheep, which they use for leather, wool, and meat, and the making of panniers, blankets, and tents. The last is especially important—a woolen tent is a sign of adulthood. “Leaving the tent” is a way of speaking of a colt or foal reaching maturity, and “joining tents” is the typical euphemism for two centaurs who marry or who sire foals.

Centaur tents are held up by ropes and a single tent pole. They provide excellent shelter from wind, snow, and rain, but there is a certain wooly smell about them, permeated with the smokiness of cook fires. In winter, the centaurs may build a wall of snow around their tent for greater warmth; their winter camps are matters of tradition and the same herd of centaurs may return to the same camp year after year or may circulate among two or three favored sites.

Society of the Centaurs

Centaur society can be divided into three main kinds of clans: the steppe nomads, the mercenary companies, and the bandits. Each of these has some kinship with the others, and all three share a fondness for direct election of their kings and war leaders. It is, above all, a meritocracy, where a king can be deposed by the will of his horde.

Clans, Hordes, Captains, and Kings

While a herd of centaurs might seem like an accurate term, they prefer to call themselves “clans” for groups up to a dozen or so, and a horde for any greater number. Clans are led by a powerful male (a stallion, chief, khan, or captain). When enough clans gather, they sometimes choose to send a group of young warriors on a yearlong or two-year “bandit year” to raid the elven redoubts or to try the defenses of the Osmanli sultan or to strike west against the lands near Zobeck. During this bandit year, the young warriors learn both the rudiments of stealth and raiding and the tactics that make them successful on the plains.

In practice, many of those on their bandit year spend only a short time raiding, then hire their services to some respected caravan master and serve as guards. This way, they visit distant cities on the islands off the coast of Arbonesse or cross the snows of Trollheim

or drink from the desert oases of Hatapesh and Siwal. These wanderers don’t always return to the steppes, but those who do have learned the arts of many lands, strange sorceries, or tricks of healing which they share in the winter camps or the summer gatherings.

Those summer gatherings are when the captains, khans, and chiefs decide whether any clan or tribe has suffered such an insult that they must be avenged. These occasions are rare (perhaps twice a generation or so), but invariably, the entire centaur nation will sweep off the plains that summer to destroy all border settlements, burn crops, and run riot against the defenses of the offending nation. The trolls, the Osmanli, the slavers of Harkasa, the prince of Doresh and others have all learned this lesson well, so few dare to wipe out a centaur band.

Two-Legged Allies

The best friends and allies of the centaurs among humanoids are humans, halflings, and elves; dwarves and kobolds distrust centaurs as too big and too dangerous, respectively. Among humans, the attitude is similar, but the Kariv wanderers and the centaurs often share a road, rustle livestock together, or raid a small hamlet for food. The Kariv understand the hardships of the road, and their smiths will always shoe a centaur for free (the practice is considered to bring good luck). In return, centaurs often act as scouts and

defenders for Kariv wanderers who may face danger from human, goblin, or other bandits. More than once has a Kariv caravan been rescued by centaur information or lances, and centaur bandits never rob the Kariv (they consider the practice ill-fated).

Elves and centaurs are a more complex mix. Elves consider centaurs uncouth, foul smelling, and boorish but find them oddly charming for their honesty, directness, and superb woodcraft and archery. Though few elves admit it, centaur archery is superior to their own in raw power and in distance. The difference in accuracy lies in the elves' favor, but as many have pointed out, "one centaur arrow is worth three of the elves'."

Cults and Religion

Centaur of Zobeck and the surrounding lands, west to Arbonesse, and east to the Rothenian plains are worshippers of many gods, from the Sun God to the harsh spirits of wind and ice. Most follow Perun, and they are invariably drawn to the primal gods: war, fertility, love, healing, and death, and have little patience for complex theology or subtle worship of magic, knowledge, or abstract codes of behavior.

Their favorite divine patron in the Free City is Porevit, the Green God in his aspect of god of wine and fertility. Centaurs are notorious for raiding wineries and brewer's shipments and for sacking them entirely.

Centaur Tactics and Combat

Centaur are creatures of both the overwhelming charge and the steady fire-and-retreat schools of warfare; in both cases, their mass and speed make them dangerous.

The Charge: A centaur charge is dangerous because it is wild and reckless; it begins with a volley of enormous clothyard arrows from their bows and then turns into a rumbling approach as the centaurs put away bow and quiver and lower their steppe lances to strike with a 20-foot reach. If the shock of the lances does not break a group of defenders (rare, but dwarven pike and other well-trained troops can withstand it), there follows the trampling of hooves and the use of long, wicked falchions.

A lethal centaur charge is always directed against opposing troops and armed defenders; a rush against women, children, or old men will always end with centaurs carrying away slaves and hostages for ransom. These are not unknown, but rare.

The Slow Burn: Centaurs, when they are truly angry, use their bows as instruments of revenge rather unlike elven archery. They fire from up to 300 yards (180 squares), raining down death in the form of large, fiery arrows that set peasant huts or granaries to burning. In some cases, they poison their arrows by rolling them in dung, to bring on the blood rotting sickness in foes (see table below).

The Standard Raid: Centaurs are happy to take anything that other races do not value enough to protect properly; this is often livestock but also grains, cloth, and coin. A standard raid begins just before dawn or at night, with centaurs shooting sentries with arrows enchanted with silence 15' radius and, then, galloping to the attack in two groups; one is a diversion, meant to draw defenders away from the object of the raid, whether that be a corral, barn, or a storehouse for grain.

Blood Rotting Sickness		Level 6 Disease	
Any cut from centaur arrows taints the blood and leaves victims feverish and weak.		Attack: +9 vs. Fortitude Endurance improve DC 23 maintain DC 19 worsen DC 18 or lower	
The target is cured.	Initial Effect The target loses one healing surge that it cannot regain until cured.	The target permanently loses one point of Constitution.	Final State The target is immobilized.

Centaur Trample (Centaur Racial Power)

You rear up and smash foes beneath your hooves, knocking them sprawling.

Encounter • Standard Action

Effect: You make a normal move, stepping into enemy squares (drawing an opportunity attack) and make a Reflex attack against the foe for 1d6 + Strength on a successful attack. You must end your turn in an unoccupied square. Increase the extra damage to 2d6 at 11th level and to 3d6 at 21st level.

Rothenian Centaur Bandit

Lvl 5 Brute

Large natural beast (mount)

XP 200

Initiative +5 **Senses** Perception +2; low-light vision

HP 80; **Bloodied** 40

AC 17; **Fortitude** 17, **Reflex** 17, **Will** 13

Speed 8

⚔ Lance (standard; at-will) • Weapon, Reach 2

+8 vs. AC; 1d12 + 6 damage.

⚡ Thundering Lance (standard; encounter) • Weapon

+8 vs. AC; 3d12+6 damage; attack must be made as part of a charge action.

⚔ Falchion (standard; at-will) • Weapon, Reach

+8 vs. AC; 2d6+6 damage.

🏹 Nomad's Longbow (standard; at will) • Weapon

+9 vs. AC; 1d12 + damage.

⚡ Trample (standard; at-will)

A centaur can move up to its speed and enter enemies' spaces. This movement provokes opportunity attacks, and the centaur must end its move in an unoccupied space. When it enters an enemy's space, the centaur makes a trample attack: +6 vs. Reflex, 1d10+4 damage, target is knocked prone.

Charger (while mounted by a friendly rider of 3rd level or higher; at-will) • Mount

The centaur grants its rider a +5 bonus to damage rolls on charge attacks. Foes knocked prone are pushed 2 squares.

Rothenian Centaur Bandit Tactics

The centaur tactics are those of nomads and horse archers: fire, move, and fire again, until your enemy is dead. They prefer not to engage in melee with an unbloodied foe, but once they sense weakness, they charge en masse to strike with their lances and then trample foes underfoot.

Centaur is easy to provoke with taunts; they will charge and engage foes who challenge them to combat.

Centaur Racial Traits

Average Height: 5' 0" – 5' 6" (at the horse shoulder), 7' to 7' 6" at the human head

Average Weight: 750–1,200 lb.

Ability Scores: +2 Constitution, +2 Dexterity

Size: Large

Speed: 8 squares

Vision: Low-light

Languages: Common, Elven

Skill Bonuses: +2 Athletics (cannot climb walls)

Centaur Leap: When you are jumping vertically, divide your Athletics check result by 6 instead of 10 (round down) to determine the height you jump in feet. With a running start of 2 squares, divide by 3 instead of 5.

When you are jumping horizontally, divide your Athletics check result by 6 instead of 10 (round down) to determine the distance you jump in squares. With a running start of 2 squares, divide by 3 instead of 5.

Rothenian Centaur Chief Tactics

Unlike his followers, a Rothenian centaur chief will almost never charge into combat, unless his quiver is empty. Instead, he strikes from a distance with shots intended to cripple and harass a foe.

A Rothenian centaur chief often has magical arrows as well, able to create burst fire or other effects.

When a chief is slain, his followers retreat in disarray.

The ecology of the chimera

by Ed Greenwood

Elminster sighed. "Well, it's one of the 'classical' monsters, sung of by every bard and written of by every sage and too many others pretending to sagacity, so I'm not surprised you asked about it." He waved his pipe at me. "Now mind, there's the chimera proper, and its crossbreeds, of which many types are rumored, but only two confirmed: the gorgimera and the thessalmera."

"Thessalmera?" I repeated, astonished. "There is such a thing as the offspring of a chimera and a thessalhydra?"

"Aye. And a more ugly, ungainly, and deadly creature you cannot imagine. Thankfully, they cannot breed." The sage sucked on his pipe and considered. "You'll be wanting a story, of course, and all that I can recall are untrue." At my questioning eyebrow he continued: "All of the ballads and folktales concerning chimerae are always either simple, bloody fights with them, and this or that hero prevailing — or they involve heroes and heroines too weak to fight a chimera, who overcame it and slew it, stole from it, or escaped from it by setting its various heads to arguing among themselves."

"This is pure piffle. Chimerae are too stupid to argue. They know only when to attack and eat weak opponents or withdraw when badly hurt. Instinct tells them what is good to eat, what is too hot or too cold for comfort, and when to mate. Most sages think of chimerae as somewhat less cunning than dragons, but otherwise about the same

as a foe, and they could not be more wrong. I've found only one report in my library that is correct — and you will note that it is correct only because it is so vague and incomplete."

Elminster then read me the following report. The added footnotes represent the conclusions drawn by the author from Elminster's detailed additions, comments, and explanations, for the study of chimerae was a hobby of his in the days when he worked with the late Laelun of Teshendale.

From the *De Naturis Rerum* ("About the Things of Nature") of Alaphondar, Sage Most Learned of the Royal Court of King Cormyr:

Of the weird and misbegotten creatures of nature, most repellent and infamous to men, one of the most ungainly and terrible is the thankfully rare chimera.

Chimeras (or "chimerae") have three heads: a goat head well equipped for cropping grass and the eating of all manner of rotting vegetables and the like; a lion head admirably suited for battling and devouring game — and a dragon head that can roast flesh and subdue even the strongest prey: man himself. It is an old and cruel joke that the chimera is the only beast that cooks its repast to the desired degree before partaking — old men roasted well done, but young ones only toasted medium rare. Much else is said, often wrongly, about this monster most foul, so herein I do set down the record straight.

A chimera is a stupid beast, but it needs little finesse to survive with the powers it possesses. It seldom cooperates with other creatures, but only rarely does one chimera fight with another. A chimera ranges widely while hunting, trusting to its powers to keep it safe from harm, avoiding only large cities or the lairs of creatures that have bested it before. It is a clumsy flier,¹ able to use its fiery breath, or only one of its heads, or its claws, in aerial combat. It prefers to pounce from flight or high ground onto prey, using its bulk to drive its victim to the ground, where it can rake with its lionlike foreclaws and bite unhampered.²

Chimeras are omnivorous, but prefer to dine on raw flesh. They kill their prey themselves, rather than scavenging or hunting with other creatures. They are largely solitary, banding together with others of their own kind only for short periods to undertake specific hunts or to mate. Chimeras take no permanent companions, but often mate with another of their own kind upon first encounter.³

These beasts have awesome powers of vitality and regeneration.⁴ In a month, one can grow a new head to replace one that is lost or badly damaged. The creature can, of its own will, cut off the blood supply to a damaged head. Then it will ram and rub against rocks to remove the wounded appendage, or sometimes bargain with another creature to devour or remove the useless flesh. If a chimera loses its dragon head, it will hide in its lair until the head grows back and the creature regains its

power to breathe fire (a gas-producing internal organ is involved). This entire process takes between two and three months.

Chimeras speak a grunting, crude form of red dragon language, and sometimes bargain with red dragons for prey and aid, in return for treasure or spell scrolls. A chimera hides such treasure (gained from prey) in its lair, usually under a concealing layer of boulders. Chimera lairs are typically in caverns, disused mines, or ruined castles, particularly if the latter structures rise high to command a view of the surrounding terrain.

The origin of the chimera is unknown; some believe it was human experimentation that initially caused the interbreeding of a red dragon, a lion, and a goat. The truth is lost in the mists of time; it is only certain that chimeras are now a stable, if rare, species, and can breed with their own kind (to produce chimeras), with red dragons (to produce more chimeras), with lions (to produce lions), with gorgons (to produce the sterile gorgimera), or with thessalhydrae (to produce the sterile thessalmera).

Notes

1. A chimera is of maneuverability class E, as are its cousins the gorgimera and thessalmera. The creature's body is very bulky, so even its powerful dragon-wings can do little more than keep the chimera aloft; high speed and abrupt sharp turns are out of the question, which is why the beast only uses flight as a means to gain a

positional advantage over a ground-based opponent. A chimera will almost never voluntarily engage in aerial combat with another flying creature, not even one as ungainly as itself.

2. The fiery breath of a chimera does as much as 3-24 points of damage to a target within a 5" distance from its dragon head, in a cone-shaped area 2" in diameter at the farthest point. Against a formidable foe, it will use this attack as frequently as possible (as often as once per round, up to 6 times per day). In a less challenging situation, the creature will rely on its claw, hoof, and bite attacks and only use its breath weapon on a 50% chance (roll separately for each round of combat). A target within the area of effect can take only half damage by making a successful saving throw vs. breath weapon.

A chimera's lion head bites for 3-12 points of damage, the slash of its goat head's horns can do 1-2 points of damage if a target presents itself, and its dragon head does 2-8 points of damage on every bite that hits. The lion foreclaws do 1-4 damage each, and the hooves on its rear goat-legs do 1-3 points of damage each from kicking (only possible against targets behind or below the chimera). The creature's tail and wings do no damage, but can buffet, trip, distract, and sometimes even knock over opponents. A chimera is capable of wielding all of its various appendages against separate foes simultaneously. Its scaled, sinuous dragon head is armor class 2, its leathery wings AC 5, and its vast, bulky body (including the lion and goat heads) is AC 6.

A gorgimera's body is entirely AC 2 except for the gorgonlike hindquarters and bull-head, which are AC 5. A thessalmera's body is AC 0, except for the gorgon-head (AC 5) and the wings and dragon-head (both AC 2).

3. The mating of two chimerae will produce offspring only 30% of the time. When it is successful, the mother will give birth to 1-3 small, mewling, helpless young 6-9 months afterward. (The gestation period is longer when multiple births are involved.) For a month after giving birth, the mother hunts for the young, dragging her kills back to the lair, and then leaves them to fend for themselves. By this time the young can breathe fire (3" range, 2-12 damage, save for half damage, same frequency limits as an adult). A young chimera does 1-6 damage with its lion bite, 1-4 with its dragon bite, and 1 point of damage apiece with any of its claw or hoof attacks. Immature chimeras are size S (2' at shoulder), can move 9" on land but only fly at 12" (for a maximum of 2 rounds at a time before needing to rest for 1 round). They have 3 HD and have AC figures of 8/7/4.

For 3 months after being left alone, the young will hunt together out of mutual necessity. At the end of this time they will have grown to 7 HD and acquired full adult powers, except that they can only breathe

fire 4 times per day. At 4 months of age they strike out on their own, and 2 months later they reach full adult size (9 HD) and powers. Thereafter they may slowly gain weight with age and heavy eating. Chimeras sometimes mate with gorgons (see *Monster Manual II*, "Gorgimera") or thessalhydrae (see below).

The very rare thessalmera lairs in swamps, jungles, or caverns, and can endure extremes of climate with impunity. A sterile crossbreed of thessalhydra and chimera, the cunning thessalmera is often found close to civilization (where it can feed upon isolated bands of travelers or upon livestock, hunting in stealth by night). It preys chiefly on the choicest of red-blooded creatures: man.

The thessalmera has the scaled, lizardlike body and pincer-clawed tail of the thessalhydra, six to eight snakelike heads, a central lion's head, and a red dragonlike head. The dragon head can bite for 2-8 points of damage or (up to 6 times a day) breathe fire in a cone up to 5" distant, 1/2" wide at its jaws and widening to 2" across at maximum range. This breath weapon does 3-24 points of damage, or half damage if the target makes a save vs. breath weapon (objects save vs. normal fire). The lion jaws bite and rend prey for 3-12 damage. The pincerlike tail does 1-12 damage on a hit, and can grasp one M-sized or smaller opponent, holding that victim immobile (roll less than Str on d20 to escape, one attempt allowed per round). The snakelike heads do 1-6 damage per bite, plus an extra 1-6 on each hit from the creature's acidic venom (unless the victim saves vs. poison). The thessalmera cannot spit its acidic venom like a thessalhydra can.

4. Chimerae, gorgimerae, and thessalmera can all regenerate 2 hit points of damage every 24 hours, regardless of activities engaged in during that time. They are also all resistant to fire (+3 on saving throws vs. all types of heat and fire) and immune to

Write on!

Got a question about an article? A subject you'd like us to cover — or *not* cover? What do you think of the magazine you're reading? Drop us a line at "Out on a Limb," P.O. Box 110; Lake Geneva WI 53147. We'll read every letter we get, and we'll select certain letters of general interest for publication — maybe even *yours!*

petrification, and the thessalmera (like its thessalhydra parent) is also immune to the effects of any sort of acid. The natural lifespans of these three creatures are unknown, but are thought to be more than 30 years in every case.

A mature chimera has 9 hit dice, distributed as follows: dragon head 2, lion head 2, goat head 1, wings ½ each, and body 3. Its dragon head can swivel 360 degrees about to attack creatures behind, above, or below the chimera, and its long, scaled neck can dart with great speed (in 1 segment) up to 1" outward, or around corners, etc., to breathe fire at opponents. The chimera

never falls into a complete, deep sleep; rather, one or two of its heads will nap at one time while the third remains watchful, able to bring the whole beast awake and alert in an instant.

The hit dice of a mature gorgimera are distributed identically to those of a chimera, except that the gorgon head has 2 hit dice, whereas the chimera's goat head has only 1, and the creature sleeps in a like manner.

A thessalmera (see above) has hit dice as follows: dragon head 2, lion head 2, tail 1, body 5. The snakelike heads can be severed by dealing them 12 points of damage each, but harming or severing one or more of them does not diminish the HP total of the rest of the creature. The venom of the thessalmera loses its efficacy upon the death of the creature, and has not yet been successfully duplicated or preserved by alchemists.

Chimerae and gorgimeras are too stupid for their heads to argue among themselves, and are in any case immune to their own breath weapons. A thessalmera is always controlled by its lion head unless it is destroyed or damaged, whereupon the dragon head takes over; if that is also destroyed, a thessalmera will become a semi-intelligent, frenzied killing machine, fearlessly and recklessly attacking all living creatures it can perceive and reach. When all such creatures are slain and eaten, it will seek a lair and remain hidden therein until its lion and dragon heads have regenerated.

DAREDEVILS™

HAVE ADVENTURES!

You can too! **DAREDEVILS** is a game of role-playing action and intrigue set in the 1930's. Players design and develop their characters who may be investigative reporters, private investigators, globe-trotting soldiers-of-fortune, mysterious cloaked crimefighters, or any of the heroes fostered by the popular culture of the era. The Gamemaster incorporates these characters into fast-paced adventures full of master villains, mysteries, fog shrouded streets, furious gun battles, and cliff-hanger escapes.

So, come and join the adventures. Become a Daredevil!

DAREDEVILS comes as a boxed set that includes the rulebook, a referee's screen with useful charts and a political map of the world, and **DAREDEVIL ADVENTURES**. This last is a collection of four adventures which allows you to begin play with a minimum of preparation.

The boxed set is available for only \$15.00.

ALSO AVAILABLE:

- **Daredevil Adventures 1: featuring Deadly Coins**
- **Daredevil Adventures 2 with Menace Beneath the Sea**
- **Daredevil Adventures 3: Supernatural Thrillers**

Each adventure is \$5.00

As reported by scout Relirva,
drow, of House Teh'kinrellz,
twenty-first house of
Ched Nasad.

To Weapon Master Durdyn Teh'kinrellz:

I must report my findings on the two patrol members found dead from similar "accidents" last week. While this sort of thing is normal, particularly when rival Houses are involved, I believe the deaths were deliberate attacks from creatures of the Underdark. A few days before the accidents, I had discovered chitines near the Outerways. My patrol hunted down the half-dozen chitines and liquidated them.

After finding the two mangled bodies of the patrol members, I began to suspect that there may be more than a just a few wandering chitines about. After spending some time scouting the area, I came across a rather large tribe of chitines (some 55 in all) living not a day's travel from Ched Nasad. Invisibly, I spent several days watching the evil creatures. The resultant information I have gleaned for this report should impress even the Archmage Ildibane!

Obviously, we must dispose of these chitines. Might I suggest having Tlathar's patrol sent unawares into the area? Their group is weak and has our rival House's second boy amongst their members. My patrol can come in as a back-up, finish the fight, and claim the victory. Survivors from Tlathar's group, if any, can be absorbed into my own group.

I hope that the following report can be of use.

Relirva

Through my close observations I have discovered that the chitines can see in the dark as well as we.¹ Their multifaceted eyes range in color from black to light grey and sometimes green. During my brief stay, they slew a newborn because the creature had red eyes; it seems they feared that the thing was possessed by a drow spirit!

Despite our previous supposition, the chitine's mandibles are only used for grasping their food while they suck the fluids from it; they are not used for attacking. Females, in general, have smaller mandibles than the males even though the two genders are roughly the same size. Nearly all their meals are caught in the wilds of the Underdark, though I did spot a small herd of rothe (probably stolen from us) corralled in a rock enclosure.

The chitine seem to use their sense of feel as much as their excellent eyesight to catch their prey. It may be that they are capable of feeling vibrations through the cavern floor,² and that may be why, despite our stealth, we have had difficulty

THE ECOLOGY OF *The Chitine*

by Belinda G. Ashley

Artwork by Terry Dykstra

in successfully ambushing the creatures. I should note that levitation and flight nullify this advantage, as should be obvious by my successful mission.

I know you are familiar with the chitines' devious web traps and mazes, but I have discovered another mode of attack. I watched a patrol of chitines surround a group of goblins. Instead of killing them outright as is their wont, they wrestled the creatures to the ground, bound them, and took them to the temple to be offered to Lloth. I was quite surprised by their efficiency."

We know the chitines live, tribe-like, in houses of web. The village is designed in concentric circles with the central building a pitiful copy of our own temples to Lloth. Chitines living the farthest from the center are the lowest in rank, while those living closer to the temple are higher. They call the circle surrounding the temple "*Wun Quarvalsharess ord'naen*" (literally, "in Lloth's arms"). The individual households, unlike our own, are very unsophisticated. There is no Matron mother, and they even have males leading households. (Barbaric!) The members of the house may or may not even be related.⁴ I saw very few young and never saw them in any of the houses. Instead,

they were kept in a special section of the temple.⁵

The chitines have no organized trade so have few, if any, shops. I was surprised to find two in this village. There was an alchemist selling poisons and potions and a simple barter shop. During my brief visit, I witnessed a caravan of duergar come to trade weapons for a small chest of potions.⁶ The presence of the shops and the caravan lead me to believe that the chitines have been here for some time and may be stockpiling weapons for future conflict.

The chitines seem to spend much of their time in worship. Everyone goes to the temple twice a day at various times. When not engaged in worship, they usually go off on patrols.⁷ In my five days of observation, I noticed an increase in these patrols in the area of Ched Nasad.

This leads me to another unpleasant thought: the chitines may be responsible for more than just the two deaths last week. How many of us have they slain unawares? I'm curious to find out.

One of the most bizarre things I saw was a contest held in a pen outside the temple. In the pen was a huge spherical cage of webbing. Two contestants were given bone clubs, put into the sphere, and

then the sphere was set into motion. The object of the contest was to be the only one standing (or should I say, conscious?) at the end of the competition. The winner was then recognized as the new head of a household. I was disappointed that the loser was allowed to live (the shame!), but he was shunned, and became literally, houseless. His few belongings were thrown out in the street and he wandered off towards the outer circle. Whether this is a permanent station or not wasn't clear to me.⁸

Our most pressing concern with this village, however, is the chitines' unusual priestesses, or *choldrith*, as they are called (see entry below). They are similar in build to the chitines, but with several differences. For one, they are completely hairless and their smooth skin is a dark, charcoal grey. They're also larger than chitines and have small, almost negligible, mandibles. Their silver-white eyes are not multifaceted like those of the others. They have incredibly long, pointed ears that resemble horns. A revolting sight I assure you!

I only saw three of these creatures and did not get the chance to watch them perform their rituals inside the temple so I can only guess at their limits of power. As far as I could tell, the choldrith were concerned only with the temple and did not interfere with other chitines except to run the contest. I also noted that the choldrith were never without their armor and weapons and were fiercely guarded over by several carrion crawlers. Through some magical means, the priestesses had control over the creatures and used the monsters to guard the temple as well as themselves. No doubt they could use the carrion crawlers to aid in defending the village.

I had to leave my observation to return to my regular duties. I stand ready to follow any orders you may have.

1. Chitines have 120" infravision.
2. Their hearing is only average, but they are very sensitive to ground vibrations. Because of this, they are taken unaware on a 1 on a surprise roll.
3. If a chitine is so inclined, he may forgo his weapon attacks and wrestle an opponent to the ground. Chitine, because of their extra arms, gain a +3 on their attack rolls.
4. In the hierarchy of the chitine, the strongest take the choicest houses and positions; the weakest are subjected to the lowest ranks and have to do the dirtiest work and are moved further from the center of the tribe. In this way, when under attack, the weakest near the outer ring are killed first. As intruders work towards the middle of the tribe, the chitines' defenses become progressively tougher.

All heads of households within the

Wun Quarvalsharess ord'naen are considered the same rank and form the council by which the tribal laws (such as they are) are made. Their goal, as a society, is to become Lloth's favorite children by destroying all drow and driders. Their lives are run in an orderly fashion: worship, patrol for food, kill their enemies, and create more chitine.

Chitine live in communal houses lead by the strongest individual, be it male or female. A typical house will have 2-7 members of mixed gender.

5. Because chitines were originally cast-off experiments of the drow, it is difficult for them to give birth and many infants are stillborn. Only 15% of a tribe will be offspring. Chitines give birth to one young every 25-35 years and keep no permanent mates.

Children are given to the Temple of Lloth at birth and raised independently of their parents. At the age of 30, the young are considered adults and leave the Temple to start a house of their own or join an existing household. This is the only time in their lives that they will not have to challenge the right to membership in a house. They may or may not return to a parent. Chitines live to be 100-150 years old

6. Chitines seldom have visitors other than their own kind and seldom barter with non-chitine, preferring to kill, trick, or steal (in that order) to get what they want. However, occasionally they will trade trinkets, potions, and other odd items for weapons and food stuffs with those they deem either too powerful or difficult to kill.
7. Patrols consists of 3-6 chitines and one superior with an AC 4 (web armor as described in the FRMC1) and 3 Hit Dice (XP value: 120).
8. The Contest: Anyone can challenge any member or head of any household to gain a higher ranking. The contest is fought until one surrenders or is beaten to unconsciousness. (Priestesses heal all wounds at the end of the battle.) The winner can choose to take the loser's belongings if he so desires. Meanwhile, the loser must obey and work for anyone asking for his services. The loser, after six months, can work his way back into the system by challenging another member or head of a household.

Choldrith are a peculiarity among the chitine race. They are born to normal chitine parents and are always female. The birth of a choldrith is considered a great blessing from Lloth and the parents are given rank within the *Wun Quarvalsharess ord'naen*. One out of every 20 births is a choldrith and they live to be 150-250 years old. Choldrith are sterile so cannot bear young; instead, they raise all the young of the tribe under their strict care in the confines of the temple, twisting their minds to the glories of Lloth.

The choldrith's tough skin gives her a natural AC of 8. Their quickness and agility give them a -2 bonus to their AC (dexterity 16). Though they have the web-making ability, they seldom use this, preferring the tribe to provide their weapons, armor, and clothing. Choldrith are quite intelli-

gent and know several of the Underdark languages such as duergar, goblin, and orkish.

Whenever encountered, Choldrith will be wearing their webbed armor, spiked mace, and dagger. If prepared for battle, they will also carry a webbed shield and fight with both weapons and shield leaving one free hand for casting spells. Unlike the chitine, the choldrith can bite with their mandibles and inflict a poison. The bite causes 1-3 hp of damage and injects a paralytic poison that lasts 1-6 hours. Normal saving throws apply. They cannot attack with their weapons the same round as they bite or cast spells. Their daggers are often coated with poison, class A.

Choldrith have the casting ability of a 7th-level priestesses. They can use scrolls and magic items and have two innate abilities: *darkness 15' radius* and *bless*. Each can be used twice a day. Choldrith live for the glory of Lloth and spend their entire life teaching others how to properly worship their deity. They seldom concern themselves with the daily lives of commoners or anything outside worship, teaching, and the protection of the tribe. Their one outlet from the temple is the running of the Contest which they passionately adore.

Though not known to be forgiving, choldrith seldom take the lives of their own people (even if from another tribe)

because they are so few in numbers. On the rare occasion that they kill one of their own, they are usually doing so because of their beliefs (as is the case for red-eyed infants) or because an individual has committed some grave heretical transgression. Backstabbing is considered by the priestesses a crime against the people and is punishable by excommunication from the tribe.

Choldrith are fanatics, willing to take their lives for the glory of their goddess. They fervently believe that their people will overcome the drow and become Lloth's blessed children. Choldrith are enraged by the sight of drow and gain a +2 to their attack rolls.

Other than the above changes, choldrith follow the same outline as the chitine entry in the *MONSTROUS COMPENDIUM*®.

Priestesses can charm carrion crawlers with a special rod granted by Lloth. These rods are very rare as Lloth grants them to a priestess only once in the priestess' lifetime. The charm is cast at 12th-level and has a two-month duration. The rod has 20-30 charges, is non-rechargeable, and can only be used by priestesses of Lloth. Each charm uses one charge. Carrion crawlers get their saving throws at a -4 to their rolls. The charm is broken only if the priestess takes offensive action against the carrion crawler or if *dispel magic* is cast upon it.

THE ECOLOGY OF CHOKERS

Innumerable creatures claim the Underdark as home. Some, such as drow, duergar, and illithids, craft daunting cities carved from the subterranean stone, creating sprawling underground empires. However, the bulk of creatures that live in the eternal darkness consist of little more than mindless beasts or barely sentient savages prowling the gloom in hopes of finding their next meal.

One such creature, the vicious predator known as the choker, derives its name from the way in which it dispatches its victims. This small aberration, a ubiquitous and dangerous part of the Underdark ecology, strikes from the darkness without warning. While not particularly powerful, this stealthy opponent proves maddeningly difficult to locate when it wishes to remain hidden. This article examines the life and habits of chokers,

including their history, physiology, and mental outlook, as well as ways to defeat them.

HISTORY OF CHOKERS

Chokers are relative newcomers to the pitch-black realms of the Underdark. Scholars and adventurers note that their numbers seem to increase with each passing year, although no one knows the reason why. One theory claims that a population of gnomes who descended into the darkness long ago evolved into chokers. Over time, these gnomes mutated into horrible aberrations, possibly due to a mixture of cannibalism and the weird magic of the Underdark. Gnomes vehemently deny this possibility and insist that any resemblances are purely superficial. The *svirfneblin* also dispute the possibility, although some seem to know more than they let on. Any attempts to pry more information from the *svirfneblin* on this topic results in stony

silence or worse. A variation of this theory involves halflings, who also find the prospect detestable.

A more likely theory involves chokers as the result of some experimentation that went horribly wrong. Many of their characteristics seem reminiscent of drow handiwork, but drow dismiss this accusation, pointing out that the creatures now pose as much of a nuisance and threat to them as to anyone else. Of course, the lofty pride of the drow might mask the truth in this matter. Some scholars note that chokers often congregate near drow settlements, either to remain close to a reliable food source or perhaps because of some lingering racial memory of their creators. Regardless, most drow despise chokers and frequently hunt them for no other reason than to kill as many as possible.

The chokers, barely sentient themselves, have no knowledge of their origin and show little interest in discovering the truth of their past. They seem

to care only about how to get their next meal and collecting shiny trinkets.

PHYSIOLOGY OF CHOKERS

Although an aberration, the choker has a roughly humanoid form. From a distance, the choker vaguely resembles a long-limbed halfling, although close up the differences become readily apparent. As a small creature, the choker stands around 3 to 4 feet tall, with smooth, dark gray skin mottled with patches of black, brown, and rust. It possesses a bony, slender frame with a jutting spine, hips, and rib cage. The choker's long, almost equine face ends in a vicious-looking mouth filled with jagged teeth. Two beady black eyes sit squarely in the front of its face, granting it excellent vision that also allows it to see through the utter darkness of its home. The relatively small ears of the choker, nestled within its skull, possibly indicate that the creature relies more on darkvision and other senses than hearing to locate prey.

Choker Knowledge

The following table shows the results of Knowledge (dungeoneering) checks as it relates to the choker. Inhabitants of the Underdark and adventurers that make forays into its depths might know this information.

Knowledge (dungeoneering)

DC Result

- | | |
|----|--|
| 10 | Dangerous aberrations that lurk in the Underdark, chokers get their name from the way they choke victims to death. |
| 15 | Chokers move easily over almost any surface and usually attack from over doorways, arches, or from cave roofs. They sometimes hide in pools and underground streams. |
| 20 | Extremely nimble, chokers move in rapid bursts of speed that allow them to move faster than it appears they should be able. |
| 25 | Food and treasure can often be used to bribe chokers into answering questions or working as guides through their territory. |

The flexible tentacle limbs of the choker allow it to reach creatures up to 10 feet away. Its arms and legs end in oversized flexible pads filled with serrated spines that allow it to grip almost any surface, including slippery cave walls. Because of its flexible, elongated limbs, the choker appears bowlegged, and it moves in a peculiar, fluid fashion, preferring to keep at least three of its limbs in contact with some surface at all times.

The choker speaks Undercommon in a hoarse, raspy voice, intermixing words with meaningless barks, coughs, and grunts. It peppers its crude vocabulary with banal epithets and baseless threats.

PSYCHOLOGY AND SOCIETY OF CHOKERS

Stealthy, solitary hunters, chokers survive on what they manage to kill and the carrion left by more dangerous predators. As befitting their name, they strangle their prey by ambushing creatures and quickly grabbing their necks. Fearless in their assaults despite their small size, chokers sometimes attack prey up to four times their size. Chokers attack through surprise and usually wait to ambush a solitary creature rather than confront a group. Particularly hungry or desperate chokers might go after a group of creatures, but only by picking off stragglers or those in the rear, where their attacks are more likely to go unnoticed.

Before a choker devours its prey, it uses its powerful grasping hands to squeeze the meat into a tenderized

pulp. The choker does this even with carrion it finds, fulfilling its instinctive desire to squeeze the life out of its meal. Although constantly hungry, chokers can survive for almost a month without meat, becoming increasingly irritable and likely to take risks in order to procure food. In a pinch, the choker subsists on lichens, moss, and fungi, scraping it off cave walls with its raspy tongue. The choker requires relatively little water for its size and seems to derive most of its hydration from the blood of its victims.

Greedy creatures, chokers covet bright, shiny objects, such as coins, gems, and jewelry. If a group of creatures comes across a choker and approaches cautiously, they might succeed at making it an offer for some sort of trade. Chokers lack any sense of diplomacy and have low Intelligence and Charisma scores,

causing the most elaborate choker bartering to consist of "I give this, you give that." A choker might offer its services as a guide through the tunnels and caves of the Underdark in exchange for coins, gems, and food. If negotiations go poorly in the first few minutes, however, the choker quickly retreats, and it refuses to reenter negotiations with the erstwhile bargainers.

Solitary beings, chokers do not tolerate other creatures—even other chokers—in their territory. Once every two years, though, females release a pungent scent that attracts male chokers. Mating is brief and violent, with males wrestling each other into submission for a female's favor. Gestation lasts for roughly six months, after which the female gives birth to a litter of two to four young. The mother raises her young for a year before abandoning them in a warren at the edge of her territory. Among the most aggressive and dangerous chokers around, these juveniles try to establish their own turf, battling with their own kind and the other foes that lurk in the darkness. Chokers generally live for about 20 years, although those in captivity occasionally reach the age of 40.

Most denizens of the Underdark consider chokers annoying menaces deserving only of eradication. The more intelligent races, such as drow, duergar, and illithids, actively hunt chokers, sending out teams of warriors and trackers to perform search-and-destroy missions. Some creatures occasionally capture chokers and attempt to train them to act as guardians and trackers. While these projects usually fail, those few who succeed produce highly loyal servants—as long as they provide the chokers with a suitable amount of live meat to hunt and eat. Because of their elastic bodies and their ability to worm through almost any crevice or enclosure, only solid-walled holding cells can hold choker slaves, adding to the difficulty and expense of such an endeavor.

The Life and Times of the Choker

The choker originally appeared in the *Monstrous Compendium Mystara Appendix*. For third edition, the choker found its place among the iconic creatures in the *Monster Manual*. It can also now be found in the new *Absorptions* D&D miniatures set as a common figure.

CHOKER LAIRS

A choker typically sets up a den in some twisting cave difficult for larger or less flexible creatures to navigate. Bones, bits of trophies from various victims, and indescribable chunks of meat squeezed to a pulp typically litter the filthy den. Chokers are intelligent enough to hide their stash of food in a place where the smell doesn't attract other predators. They also prowl close to the settlements of other races, picking through garbage and occasionally ambushing loners who stray too far from safety. Most chokers hide their treasure among the debris and bones of their lair, occasionally pulling out particularly shiny bits and baubles to admire when it's safe to do so.

Chokers establish their lairs near crossroads or other places with readily available prey. In an ideal situation, the entrance to a choker's lair is a difficult-to-spot narrow crevasse only accessible by climbing up a wall. Chokers dislike large spaces, so they often lair behind tiny apertures that Medium or larger creatures find uncomfortably cramped. A choker tries to find a space with at least one—and preferably two—escape routes that it can block with loose stones easily overlooked by a casual search.

VS. CHOKERS

A stealthy, cunning foe, the choker relies on surprise to ambush its prey. Archways and stairwells provide chokers with ideal ambush locations, forcing prey to lift their heads in order to see (and thus, expose their necks more to the angle of attack). *Fly*, *levitate*, and *spider climb* allow you to fight wall-clinging chokers on more even terms. However, since chokers are CR 2 creatures, characters of a level high enough to cast those spells rarely consider a single choker much of a danger.

Despite the choker's Small size, it has the 10-foot reach of a Large creature. The choker always uses this to its advantage, attacking from ceilings, around corners, or from holes in the ground, gaining as

much cover as possible. In order to get around the reach issue, front-line fighters should use reach weapons to hold the choker at bay, while the rest of the party attacks with ranged weapons and spells. *Magic missile*, always a solid choice, ignores whatever partial cover the choker might find. Ray spells and area of effect spells, especially those that don't allow a Reflex save, also can be effective. The ranged touch attack of ray spells eliminates most of the choker's relatively high armor class, giving the average sorcerer or wizard a decent chance of hitting it. Other useful spells include those that hinder a choker's movement or keep it trapped, such as *hold monster*, *slow*, and *web*. The various wall spells, such as *wall of stone*, block its egress and force the choker to fight more on your terms. Other useful items include smokesticks (to flush it out of a hiding space), tanglefoot bags (to stick it in place), or nets.

The choker is very particular about which victims it attacks. Given a choice, it goes after creatures in the following order: a creature by itself, a creature of size Small or smaller, a creature with no obvious weapons, a creature more than 15 feet away from its comrades, and a Medium or larger creature. Thus, a halfling or gnome scouting ahead of the party needs to be exceptionally wary of chokers. Scouts need a high Spot modifier to overcome the choker's +10 Hide skill. A high Listen modifier helps, but once a choker finds its ambush site, it tends to stay still. The surest way to avoid choker ambushes is for the party to stay as close together as possible.

The choker's quickness ability allows it to take an extra standard action or move action during its turn each round. This means that a choker can move its base speed of 20 feet and make two tentacle attacks in the same round. However, because it lacks Mobility or Spring Attack, and its attack often requires several rounds to kill a victim, the choker prefers to attack from ambush, often gaining a surprise round. In addition, because of its ability to climb with ease, the choker often retreats by clambering up a wall, away from all but ranged weapons. To prevent this from happening, characters should move to block the choker's route of escape, so it provokes multiple attacks of opportunity whenever it moves.

Because of the choker's greed, it's possible to make an offer of treasure or food to a looming choker before it attacks. In most cases, this makes it pause while it ponders the offer. The choker knows little beyond what happens within its hunting territory, and questions of an abstract nature or about individuals tend to confuse it or result in it giving a random answer. It knows sources of fresh water, areas where food is plentiful, and the quickest passage (for the choker) through certain areas. When traveling in areas of known choker activity, always carry a few shiny trinkets and pieces of raw meat in order to bribe any chokers met. Of course, you need to see them first, which means you'll need darkvision, good Spot checks (or excellent Listen checks), or a little luck. ■

THE ECOLOGY OF THE

CHUUL

With crushing claws and crippling tentacles, one creature has torn itself a niche among the fetid waters of the land's most deadly wildernesses. Although the vicious chuul has only recently appeared in the lands of civilized races, already it is renowned as one of the world's deadliest swamp predators. With its monstrous pincers, glistening carapace, and paralytic tentacles, the chuul is a threat to even the most skilled warrior. While physically powerful, a chuul's greatest advantage over other swamp dwellers is its keen mind. Its hulking body belies an intellect that matches the average human's and surpasses those of many of its swamp-lurking competitors.

HISTORY OF CHUULS

The first chuuls appeared within the world's swamps merely a few dozen years ago. Most sages assume that, given their strange physical mixture of insectile, reptilian, and crustacean traits, they are the result of a madman's experiments. After all, many of the world's most terrible

monsters arose from arcane tampering with the secret processes of life. None can say where chuuls first arose, but the methods by which they spread paint them as an insidious, cunning enemy.

Six years ago, an expedition under the command of the elf wizard Tarthalas Driishan set sail for the endless waves beyond the horizon. Tarthalas had uncovered the ancient library of the archmage Kleptis. The archmage's journals described a tropical island far from established trade routes and major currents. According to the books, this place was once the abode of a powerful mage who had gathered great material and arcane wealth. Supposedly, the world had ignored him until he unleashed a strange, terrible army of aberrations to conquer nearby lands. When he revealed himself as a threat, the nearby civilized nations banded together to destroy him.

The journal detailed the island's location, but the notes ended with the entry that described Kleptis's preparations for the ocean journey. Tarthalas assumed that the archmage had failed to reach his destination or had died there. In his

hubris, Tarthalas believed that with his skills and magic he could succeed where Kleptis had failed. Gathering his resources, Tarthalas organized a fleet of three ships to venture out to the island and recover its treasures.

When Tarthalas and his men arrived at the island, they soon learned why Kleptis never returned. The place was overrun with a bewildering array of strange and deadly monsters. Its ecosystem resembled a continuous, blood-thirsty war between predatory creatures. Tribes of primitive mind flayers attacked his crew by night, killing scores of sailors. Three-armed, brutish giants assaulted the ships during the day, while expeditions into the jungles encountered ettercaps, otyughs, gibbering mouthers, and a variety of previously unknown monstrosities. Howling lizardfolk assaulted the sailors with barbed javelins and poisoned darts. Plants lashed out at the explorers, choking them to death in powerful vines or drowning them in murky pools. The monstrous hordes destroyed two of Tarthalas's ships and slaughtered their crews. When a captured and magically dominated lizardfolk revealed nothing about the ruins Tarthalas came searching for, he and the survivors began preparing for the voyage home.

CHUUL KNOWLEDGE

The following table shows the result of Knowledge (dungeoneering) checks related to chuuls. Those who live near swamps or plumb the Underdark's alien depths might know this information.

Knowledge (dungeoneering)

DC	Result
10	Chuuls are amphibious creatures that combine the most deadly aspects of crustaceans, insects, and snakes.
15	Chuuls attack from ambush whenever possible. A chuul can crush a man to death with its claws if it manages to grab hold of its prey.
20	Chuuls are surprisingly intelligent and might set a variety of traps for their prey. They often create simple underwater lairs and gather treasure and other trinkets there.
25	A chuul's tentacles might seem puny, but they are coated with a paralytic venom. Chuuls possess a particular hatred of all humanoid creatures.
30	Despite their size, chuuls have short arms and can't reach especially far. Chuuls sometimes put aside their hatred of humanoids to barter for goods and information, using the treasures of previous victims in trade.

What the lizardfolk's gibbering did reveal was that the creatures of the island had fought and died for centuries. The lizardfolk spoke of a mighty god who had once ruled the island. One day a horde of monsters that walked upon the water beached themselves and unleashed a torrent of smaller beasts that killed the god and reduced his temple to dust. It spoke of beings called the enforcers, hulking warriors that once defended the god

but had walked across the sea on some unknown quest before the god's demise. Since that time, the island had fallen into chaos as the god's progeny, freed of his calming influence, battled for supremacy. Every year, new species arose to fight for dominance, either dying at their enemies' jaws or carving out a link in the food chain. The entire ecosystem seemed to be focused on producing the deadliest creatures imaginable in an evolutionary process

gone haywire. Once, the creatures had struggled for the god's amusement and favor. Now, they battled to survive.

On the night before Tarthalas's departure, the primitive mind flayers made their final assault and slew the wizard. During the fighting, the sailors failed to notice three large, clawed beasts that slipped pulsing egg sacs through a porthole into an empty cabin. In the morning, relieved that they had survived, the remaining sailors cast off for home.

None would live to see their destination. The newborn chuuls picked off the crewmen one by one, carefully pacing their attacks to satisfy their hunger while leaving enough survivors to guide the ship to its destination. After slaying the last sailor, the chuuls leapt overboard in sight of land and swam to their new homeland.

Some of the forgotten god's enforcers had never left the island, and now they had a chance to escape it. Driven onward by their creator's final orders to battle against all humanoids, they were determined to avenge their ancient, bitter defeat.

PHYSIOLOGY OF CHUULS

The individual organs and parts of a chuul bear a resemblance to those found in other organisms, but the collective whole they form is utterly unique. The chuul's outer shell and massive claws give it an outward resemblance to a crustacean, but its rear legs and exoskeleton mark it as a gigantic insect. Stranger still, dissection reveals that the foremost sections of its body resemble a serpent. With its thick carapace removed, a chuul looks like the upper half of a tentacled serpent fused with the hindquarters of a giant water bug. A closer inspection supports a literal interpretation of this initial appearance. Through some trick

of evolution or arcane experimentation, a chuul is the union of two creatures that shared such a close symbiotic bond that they eventually melded into a single species.

The divide between the chuul's brutish appearance and its surprisingly keen intellect traces back to this symbiotic link. Its basic body form derives from a monstrous animal that fused qualities of crustaceans and insects. This simple creature lacked the chuul's

intellect and its paralytic tentacles. The second half of this duo was a small, snakelike aberration that hunted by paralyzing its prey, burrowing into its brain, and slowly feeding as it controlled its victim's body like a puppet.

On the hellish island that spawned the chuul, these two creatures adopted a close relationship, with the serpentine puppet masters preferring to victimize the crustacean-insect creatures. Over centuries of artificially accelerated evolution and magical intervention, the chuul's predecessors merged into one species.

Chuuls are relatively new to ecosystems beyond their home island. That they have spread so quickly across the

world, and even into the planes, illustrates the potent combination of their keen minds and mighty bodies. Worst of all, most of the chuuls that dwell near civilization are relatively young. Who can say what horrors await the world as chuuls grow old and develop into growth phases beyond adulthood?

PSYCHOLOGY AND CULTURE OF CHUULS

In the hyper-competitive environment that spawned the first chuuls, their young had little time to learn the tricks and tactics needed to compete with stronger, faster, and deadlier creatures. Over time, chuuls evolved a mechanism that allowed them to pass on some knowledge from one generation to the next. A newborn chuul possesses a portion of the hunting knowledge its parents accumulated, retained as vague images and sense memories. While many of the less important details fade, some chuuls possess thoughts that trace back generations, but more as a form of heightened

instinct than as actual memories. This ancestral instinct shapes much of a chuul's actions and attitudes regarding other races.

Chuuls see themselves as locked in a war against the humanoid creatures of the strange new lands they inhabit. In the misty past of their race, they were formed to fight against all outsiders. This siege mentality has remained with them. To the chuuls, anything that walks on two legs and has hands is a mortal enemy. After all, men, elves, lizardfolk, and orcs inevitably dominate the regions they settle. To chuuls, this is a sure sign that humanoids are their primary competitors. Thus, they harbor a deep, racial hatred

CHUUL LAIRS

Chuuls most commonly lair in natural aquatic caverns, sunken ships, sewer tunnels, or underwater complexes created to their own alien specifications. While the drowned caves and other preformed structures they inhabit might take a variety of shapes, their river bottom homes—usually formed of fallen branches, swamp mud, and various debris—have a relatively uniform layout.

In such a chuul-constructed lair, an underwater entrance leads into the first of several roughly circular chambers. This entrance room often holds a makeshift door made from an uprooted tree stump or other barrier that creatures weaker than a chuul might have trouble moving (requiring at least a DC 15 Strength check to move aside). Past this barrier lies the chuul's all-purpose sleeping and eating chamber, decorated with the humanoid bones of past meals. If any chamber in the lair is even partially filled with air it's likely to be this main room, allowing a chuul to house a slave or the rare prisoner here. A third circular space commonly branches off from this central chamber, holding the chuul's trophies from previous ambushes and raids. While a chuul lair is likely to be at least this simple, one housing a pair or pack of chuuls is likely to be significantly larger and more complex, with every resident chuul having its own trophy room.

CHUUL TROPHIES

All chuuls harbor a notorious hatred of humanoid races, one they openly express in their lairs. Within these grim aquatic halls and in specialized trophy rooms, chuuls exhibit the bones and treasures of humanoids they've defeated. While an opponent's most valuable possessions are often traded away, particularly impressive pieces are sometimes hoarded or worked into totems and fetishes consisting of the rest of the victim's remains. Chuuls commonly determine status by which chuul possesses the greatest number of or most impressive trophies, although all an ambitious or covetous chuul must do to advance is slay another chuul and claim its best trophies as its own.

d10 Example Chuul Trophies

- | | |
|----|---|
| 1 | A totem of six halfling skulls impaled upon a lizardfolk spear. |
| 2 | An entire dwarven skeleton, purposefully shattered then reassembled. |
| 3 | A humanoid spine fashioned into a necklace with a number of finger bone bangles. |
| 4 | An elven skull randomly punctured by seven arrows of elven make. |
| 5 | A pouch filled with humanoid teeth of wildly varying sizes. |
| 6 | The skull of a giant crocodile with lizardfolk claws in place of teeth. |
| 7 | A stack of human hands and snake meat stacked upon a rapier like a shish kebob. |
| 8 | The dismembered arm and claw of another chuul. |
| 9 | A finely stitched quiver crammed with elven rib bones. |
| 10 | A number of humanoid femurs arranged in a sunburst pattern with a black dragon skull at the center. |

of such creatures and delight in tormenting and slaying them whenever they have the opportunity.

Even the most simple humanoid activities in an area a chuul considers its territory are sure to attract its murderous scorn. A caravan bound through a swampy region might find that its sentinels disappear one by one over the

course of several nights, dragged off by an unseen opponent smart enough to avoid a large scale confrontation. Hiding amid the rampant vegetation, a chuul might then attack supply wagons, knocking them over and destroying the food and water stored within. Next it strikes at the horses, mules, and other beasts of burden. Finally, when the

surviving guards and merchants teeter on the verge of starvation, when the endless panicked hours of marching through deep mud and foul water have drained their strength, the chuul closes in for the kill. To a chuul, this carefully planned assault is little more than a game of cat and mouse.

While chuuls hate all humanoids, they sometimes work with beholders and mind flayers. Those races typically use their magical abilities to dominate their chuul servants, but sometimes they form tenuous alliances. A chuul's racial memories tell it that mind flayers and beholders are creatures native to its race's home island and might be worked with to defeat particularly dangerous enemies.

Chuuls have also been known to sometimes put aside their hatred of humanoids to work against greater threats. While a chuul never willingly serves a humanoid creature, it might approach such creatures to benefit itself. Understanding that even the most monstrous humanoid races find their forms just as disgusting as they find the humanoid shape, chuuls sometimes work with such races via a messenger or slave. Such a servant is most often a member of a humanoid race less intelligent than the chuul (usually a kobold, goblin, troglodyte, or lizardfolk) and is pressed into its service either by the promise of wealth—taken from the chuul's previous victims—or violence. Once forced into a chuul's employ, such a servant trades for information or goods its master's form would prevent it from creating itself—which is a great deal, considering that a chuul's massive claws prevent the fine manipulation of small or delicate objects. In this manner chuuls become aware of much happening within the areas they inhabit and sometimes gain the materials needed to make surprisingly complex traps.

The chuuls' racial memory also makes them a dangerous threat, for they remember glimpses of their homeland and wish to extend that perfect environment to the mainland. Some chuuls even remember their creator, and many wish to help restore his

legacy. If their plans come to fruition, they could import an entire malevolent ecosystem that could push aside the native plants and animals. Thus, a chuul might gather treasure and items not merely as keepsakes or out of greed, but to help secretly fund more expeditions to its native lands. A chuul might spare a traveler, offering him a bribe in return for such service. Other chuuls leave slave-created maps to their homelands in treasure caches beside busy roads for travelers to uncover.

VS. CHUULS

Malicious and devious in a way no crocodile or giant serpent could be, chuuls are some of the deadliest threats of the swamp. Even when outside its favored environment, a chuul's host of natural weapons and abilities makes it a fearful combatant.

Alien Physiology: Unnatural abominations warped by magic and an afflicted environment, chuuls do not possess a physiology like any natural creature. As such, poisons and similar toxins do not affect chuuls, and those relying on such solutions when fighting these aberrations might be in store for a fatal surprise.

Beware of the Water: In stagnant ponds and swampy waterways, Chuuls often lurk just below the surface, waiting for prey to pass nearby. Even the dark depths below the water's surface doesn't hinder a hunting chuul, as its darkvision allows it to see nearly as well as it does on the surface. Thus, those passing through areas potentially home to these predators should remain watchful for patiently prepared ambushes from even the most placid pool.

Keep Away: Since chuuls are one of the few Large creatures that lack reach, longspear and ranged weapons can keep them at bay. These armaments form a good combination with a mobile strategy, keeping the chuul at a safe distance while opponents maneuver around it. Other basic tactics like using ranged weapons and preparing the spell *remove paralysis* should also help keep one out of a chuul's reach.

Cowardice: Despite all their cunning and strength, chuuls universally

possess low Charisma scores. Such a flaw most commonly manifests as intense cowardice. As such, chuuls are easily scared off or unnerved when faced with larger or obviously more powerful creatures or groups.

Slow Eater: When fighting chuuls, remember that they must use a move action to transfer a victim from their claws to their tentacles. Thus, if one can keep a chuul moving it cannot make full use of its abilities.

Aberrant Intelligence: Adventurers cannot forget that chuuls are highly intelligent predators and use tactics that expose a party's weaknesses. A chuul might rush for the party's sorcerer or wizard for an easy meal, ignoring heavily armored PCs in favor of a softer target. Unlike animals and brutish aberrations, the chuul is smart enough to maximize its abilities.

Given their hatred of humanoid life, chuuls rarely parley. They can

speak Common, but if they stop to talk, one can count on a trick or an offer intended to cause havoc. When a chuul truly does wish to parley, it most commonly uses a servant as a mouthpiece.

Adventures seeking unparalleled information about an area might be able to barter with a chuul or its servant, offering food and information of their own in return. However, a chuul will attempt to unbalance even a situation such as this to its favor, so negotiators should be exceptionally wary. ☞

OUT OF THE WADING POOL

The chuul was newly created for the third edition *Monster Manual*, making it a member of D&D's monstrous family for only four years. It also appears as a rare figure in the recent *Aberations DUNGEONS & DRAGONS Miniatures* set. Being one of the few mid-level aquatic creatures, chuuls fill a useful niche and have appeared in numerous *DUNGEON* adventures, including "Tammeraut's Fate" (in #106), "Strike on the Rabid Dawn" (in #111), and "The Styes" (in #121 this month). For more on chuuls, check out *Lords of Madness*, also releasing this month.

Exology of the Cloaker

by Paul Leach
Art by Jon Hodgson

Diagram by Kathy Barker

An awful face stares from its thin sheet of a body, and its wings move with a slow, steady beat.

With its entire core vibrating from deep within, a powerful groaning disorients victims until the creature finally finishes them off with its whiplike, spiny tail and shallow maw.

The monster thinks nothing of the terror it inflicts on lesser beings, which it feels differ little from the vermin that infest the cavernous depths that the cloaker and the swarms of its brethren haunt.

Rarely venturing to the surface world, cloaker swarms haunt deep underground caverns and rifts. Though long associated with deep caverns, they trace their ancestry back to the Plane of Shadow and before that back to a lost plane filled with luminous clouds and plasmic storms.

The cloakers express no desire to return to their ancestral home, for they enjoy a comfortable position among the weaker denizens of the “world below.” Besides, their centuries-spanning exodus gave this race of opportunistic and inquisitive flying monstrosities new powers that they are loathe to give up.

The Great Exodus

Long ago, in a time when extraplanar travelers commonly visited the Mate-

rial Plane and shaped its history, a cabal of wizards accidentally opened a gate in the midst of a gigantic cloaker swarm.

The powerful magi closed the portal as soon as they could, but this only delayed the arrival of the cloakers. As the portal dissolved, the cloakers slipped into the Plane of Shadow rather than directly into the material world, buying the magi time.

Embracing the Shadows

The Shadow changed the cloakers forever. They embraced the stygian darkness, and its taint gave them the power to manipulate shadowy illusions. The cloakers’ fibrous skin absorbed the plane’s twilight essence as readily as cloth absorbs pitch. The monsters soon learned to use ripples in their flexible bodies to weave shad-

ow shapes that took on brief lives of their own, creating effects similar to obscure vision, dancing images, and silent image. Strengthened by their new powers, small colonies of cloak-ers dominated isolated regions of the plane. They brutally interrogated any shadow creatures they could capture, but it was the humanoids, whose beliefs were entirely foreign to the curious invaders, that intrigued them the most. Experimentation proved useless, for the frail forms fell apart under sonic probing.

The persistent shadow flyers refused to surrender their dream of tasting the now-legendary solid world and its intelligent, limbed beings. To this end, they established an alliance of sorts with the twisted shadow fey, servants of a shapeless power of twilight and evil.

The pact forever marked the cloak-ers as one with the Shadow, allowing them to retain their illusory powers even if they left the eternally gray realm. From that time forward, all cloak-ers received the innate gift of shadow shifting. The dark fey led the cloak-ers to the “world below,” where the deepest crevasses end not in stone or steaming magma but simply pass into the Plane of Shadow.

Into the World

In the “world below,” drow, dwarves, and other humanoids provided the cloak-ers with unwholesome diversions. They found the humanoid concepts of divinity and mythology quite odd: why would such weak creatures believe themselves to be superior to animals and insects? Cloaker inquiries met with blank incomprehension from both drow and dwarves.

At last, the cloak-ers found the mysterious and lush world that their progenitors had briefly glimpsed so long ago, but they found their plans of conquest already thwarted. Failing to comprehend the semi-divine nature of the amorphous Shadow entity, the cloak-ers could not grasp the full extent of their bond with the being and its plane. The cloak-

ers discovered they could only make short ventures to the “world above,” for they found the moonlit nights repulsive and the sun-filled skies lethal. Given enough time on the surface, a cloaker withers away to a rubbery patch of shadowstuff. With no allies, the cloak-ers remain in the depths and tend to their own needs, and possibly those of the Shadow Goddess.

What of the eldritch gatekeepers who sought to protect the races of the sun and moon from the incredible flying terrors from the edge of the cosmos? None of the magi could agree on how to defend the world, and the cabal dissolved as each arcanist sought the best way to stop the cloaker invasion. All failed to create a spell or artifact able to defeat the nightmare creatures. However, one wizard—a shadow fey—returned to his home plane to tempt the enemy with their own hubris and ally them with his own dark goddess.

Physiology

Cloakers superficially resemble the manta rays found in the world’s oceans. However, a closer examination of the two species proves that they share no connection. Its outward appearance is simple, if not disturbingly alien; a black dorsal and palest white underbelly marred by

fiendish ruby eyes and a round maw filled with jagged teeth. Single claw appendages emerge from the body on either side of its face, giving the cloaker the ability to crawl when necessary. A flexible tail composed of bone, cartilage, and muscle completes the nightmare. The monster’s body, as thick as a sturdy woolen cloak, enables the cloaker to make the most impossible twists and turns, which allows it to make difficult maneuvers in mazelike tunnels, vents, and sinkholes.

The cloaker’s terrifying body, mouth, and tail are horrifying, but its victims most often succumb to the creature’s hateful moaning. It’s the reverbatrix, an internal organ that lies along the spinal axis, that creates an array of sonic effects that sicken, panic, or stupefy the cloaker’s prey.

This organ is composed of three distinct parts: a ribbed, cartilaginous fluting (part of the cloaker’s upper respiratory system, similar to a human’s bronchial tubes) which produces all normal and magical vocalizations; a bladder that controls air flow through the lower throat; and a bone-hard aperture, which controls the frequency and pitch of the creature’s sounds by vibrating some or all of the organ. The upper throat and digestive tract both feed into the bladder, providing

Table 1: Knowledge of the Cloaker

The following table shows the results of a Knowledge (dungeoneering) check as it relates to cloak-ers. Those who study cloak-ers or aberrations, as well as those who inhabit or make their living in the “world below”, are most likely to possess this information.

Knowledge (Dungeoneering)
DC Result

- 10 Cloakers are monstrous cloak-bodied creatures that inhabit underground caverns. They fly and sometimes attack enemies by using their tails or engulfing them within their folds and biting them.
- 15 Cloakers use their extraordinary moan to frighten and disable their victims. These sonic attacks may unnerve, cause fear, nauseate, or stupefy opponents. They also have illusory powers in regards to shadow magic. They speak Undercommon.
- 20 Cloakers migrated from the Plane of Shadow. Sub-species exist, and they utilize even more shadow-based powers.
- 25 Cloakers originated in some unknown plane, but they became trapped on the Plane of Shadow when they first attempted to reach the Material Plane.
- 30 Large groups of cloak-ers can gather in their cavernous hives, especially during the month-long mating season each year.

the reverbatrix multiple air and gas sources.

The reverbatrix does more than disable the monster’s foes. The organ controls blood and airflow throughout the cloaker’s body, enabling its sheets of muscle to suddenly take flight and make unexpected engulfing attacks. The reverbatrix provides essential support to all of the cloaker’s bodily systems, and when a cloaker is wounded, its hum keeps the creature in a state of mild euphoric detachment. A cloaker suffers and dies if its reverbatrix is severely damaged, but it has an excellent chance at a full recovery of even the most serious wounds if its reverbatrix is intact.

Cloakers give birth to live young in small litters of half a dozen. No larger than rags, the newborns look like tiny versions of adult menaces and most take flight immediately after leaving the mother’s womb. Many expectant cloak-ers birth their brood from the heights of great caverns, so they have plenty of time to catch any failed flyers. Mothers and fathers carry weak or sick offspring in their mouths if necessary.

A cloaker that shows no sign of mastering flight has little chance of survival, and its parents surrender it to the cavern depths.

A cloaker grows to maturity in 4 years, watched over in a creche of hundreds of other young by cloak-ers charged with teaching them the history and power of the race. Most live about 30 years, although specimens that attain Huge size may live twice as long or more. The greatest cloaker lords measure their lifespan in centuries.

Cloakers live on the bats and vermin that inhabit their cavernous homes, but they sometimes eat larger prey, such as humanoids. The monsters require little food in spite of their Large size. In times of food shortage, a cloaker’s reverbatrix converts external vibrations into metabolic energy, much like a plant converts sunshine.

Psychology

During the cloaker’s childhood, it learns of its race’s origins and planar wanderings. It receives encouragement to master its own power and

impose its will on the lesser creatures of the world. While not inherently evil, the cloaker thinks nothing of tormenting and killing any creature other than another cloaker. A victim’s intelligence makes no impression on a cloaker’s territorial morality. Cloakers view themselves as the supreme beings of the multiverse, and all other beings only qualify as beasts. Nevertheless, in addition to its own strange language of hollow moans, most cloak-ers find it useful to learn the Undercommon tongue of the dangerous drow, duergar, and svirfneblin.

While the cloak-ers display a great level of arrogance, they rarely underestimate their victims and always treat them cautiously. They subtly observe unfamiliar creatures whenever the opportunity arises, even going so far as infiltrating an enemy’s nest in order to gather intelligence before they strike. Few foes watch their cavern ceilings as carefully as they should, where cloak-ers may lurk for days or weeks.

Cloakers show special interest in the members of the surface world (often represented by adventurers) that they encounter in natural caverns, mines, and dungeons. They respect aboleths and their unfathomable agendas but consider them nothing more than extremely dangerous monsters. When a cloaker bothers to parley with another being, it has paid that creature the greatest compliment.

The cloak-ers’ sense of superiority clashes with the ideologies and religions of most humanoids. Whether or not they are brutal and savage or peaceful and enlightened, the god-worshipping mortals of the Material Plane contradict the cloak-ers’ understanding of the multiverse.

A cloaker’s mind innately rejects the notions of a divine creative spark or spiritual transcendence beyond the material world. While they understand powerful beings called gods exist, they do not believe in their inherent divinity. A god is not a god to a cloaker.

Dread Cloaker CR 7

Usually CE Large aberration

Init +8; Senses darkvision 60 ft.; Listen +17, Spot +17

Defense

AC 20, touch 13, flat-footed 16

(+4 Dex, +7 natural, -1 size)

hp 76 (9d8+36)

Fort +7, Ref +7, Will +9

Immune cold, electricity; polymorph and mind-affecting attacks

Offense

Spd 10 ft., fly 40 ft. (average)

Melee tail slap +11 (1d6+6 plus poison) and bite +6 (1d4+3 plus poison)

Space 10 ft.; Reach 10 ft. (5 ft. with bite)

Special Attacks engulf, moan, poison

Tactics

Before Combat Dread cloaklers typically wait to ambush passing prey. They prepare for combat by activating all of their shadow shift powers, if possible.

During Combat A single dread cloaker facing multiple opponents often initiates combat by using its moan ability to nauseate as many enemies as possible. Otherwise, it will use its moan fear effect to remove as many foes as it can before it weakens foes with poisonous tail slaps. If facing a lone opponent, the dread cloaker will open combat with a stupor effect. If the enemy resists stupor, the monster makes tail slap attacks followed by an engulf attempt.

In a group, two dread cloaklers make sonic attacks to support their companions in melee.

Morale Dread cloaklers are bloodthirsty and fight until they are at 1/3 hit points. They often return to a combat site a few rounds later to finish off any victims of their poison.

Special Abilities

Engulf (Ex): A dread cloaker can wrap a Medium or smaller creature in its body as a standard action. The dread cloaker attempts a grapple that does not provoke an attack of opportunity. If it wins the grapple check, it establishes a hold and bites the engulfed victim with a +4 bonus on its attack. It can still use its whiplike tail against other targets.

Attacks that hit an engulfing dread cloaker deal half their damage to the monster and half to the trapped victim.

Moan (Ex): A dread cloaker can emit a dangerous subsonic moan as a standard action. By changing the frequency, the cloaker can cause one of four effects. Dread cloaklers and normal cloaklers are immune to these sonic, mind-affecting attacks. Unless otherwise specified, a creature that successfully saves against one of these effects cannot be affected by the same moan effect from the same cloaker for 24 hours. All save DCs for moan effects are Charisma-based.

Unnerve: Anyone within a 60-foot spread automatically takes a -2 penalty on attack and damage rolls. Those forced to hear the moan for more than 6 consecutive rounds must succeed on a DC 17 Will save or enter a trance, unable to attack or defend themselves until the moaning stops.

Fear: Anyone within a 30-foot spread must succeed on a DC 17 Will save or become panicked for 2 rounds.

Nausea: Anyone in a 30-foot cone must succeed on a DC

17 Fortitude save or be overcome by nausea and weakness. Affected characters fall prone and become nauseated for 1d4+1 rounds.

Stupor: A single creature within 30 feet of the dread cloaker must succeed on a DC 17 Fortitude save or be affected as though by a hold monster spell for 5 rounds. Even after a successful save, the creature must repeat the save if the dread cloaker uses this effect again.

Poison (Ex): The dread cloaker's tail sting and bite are toxic, injecting shadow essence poison into the victim with each hit (Fort DC 18, initial damage 1 point of Strength drain, secondary damage 2d6 points of Strength damage). The save DC is Constitution-based.

Shadow Shift (Su): A dread cloaker can manipulate shadows. This ability is effective only in shadowy areas and has three possible effects.

Obscure Vision: The dread cloaker gains concealment (20% miss chance) for 1d4 rounds.

Dancing Images: This duplicates a *mirror image* spell (CL 9).

Silent Image: This effect duplicates a *silent image* spell (DC 16, CL 9). The save DC is Charisma-based.

Level Adjustment —

A black raylike creature glides and turns in the cavern, whipping its long, bony tail. Blood red eyes glow dully and a wide slit of a mouth reveals bone yellow fangs. An oily substance, dark as midnight, oozes from the monster's clicking teeth and quivering tail stinger.

The ancestors of dread cloaklers delved long into the evil and forbidden mysteries of the Plane of Shadow, growing crueler and more dangerous than their normal cloaker kin. They love to kill and devour victims and particularly enjoy weakening them with their poisonous tail slaps.

Dread cloaklers are not as numerous as the normal run of cloaklers and most of them live solitary lives in small mobs of no more than half a dozen creatures. Every now and then, a dread cloaker dominates a hive of normal cloaklers, urging the community to greater acts of terror and slaughter. These are sometimes referred to as a "Hive Queen" or "Cloaker King," though the cloaklers themselves claim no such titles.

Much like their cloaker brethren, the minds of dread cloaklers are inscrutable to most humanoid minds. They limit communication with lesser beings to sonic assaults and poisonous bites and stings.

A dread cloaker is slightly larger than a normal cloaker, with a wingspan of 9 feet. It weighs 120 pounds. Its black body assumes a reddish tone after it feeds.

This unwillingness or inability to accept the core mysteries of humanoid religions, mythologies, and ideologies creates an impasse between cloak-ers and intelligent mortals. These elusive concepts fuel the cloak-ers' curiosity about the bestial humanoids they harass and destroy.

The Great Dissonance

Beyond its personal pursuits, a cloaker learns the importance of the Great Dissonance, the communal experience that transcends individual cloak-ers and binds them together into hives and swarms. A Great Dissonance occurs when at least a dozen cloak-ers drone and moan a number of bizarre chants collectively and purposely.

Cloakers find the simultaneous variations of sonic vibrations soothing and therapeutic, while most other creatures find the event nothing less than a mind-bending aural assault. A group of cloak-ers creates the Great Dissonance on no known schedule, although the strongest ones typically initiate such an event, and it is more frequent during the mating season.

The Great Dissonance notwithstanding, a cloaker has few social obligations to its community. It hunts, mates, and raises its young as it wills during mating season and migration. The elder cloak-ers exert a measure of authority, and they assign certain tasks as needed. Typical assignments include sentry and patrol duties, prisoner snatches, and foraging.

Treasure

Cloakers collect treasure because most humanoids value it, and they place rather less value on gold and gems themselves. Coins are used in those uncommon transactions with them.

Rings are especially prized, for they can be worn on a cloaker's tail. Cloakers rarely produce even the simplest magic items, so they must rely on thievery, purchases, and spellcasting slaves to acquire them.

Heroes Vs Cloakers

Cloakers use powerful sonic attacks that can unnerve, entrance, panic, nauseate, or stupefy opponents. Besides flight, the creature protects itself with several illusory shadow-shifting tricks that provide either concealment or the benefits of mirror image or silent image. A cloaker's saving throw bonuses (especially the +7 Will save bonus) give it a fair chance against most spells cast against it. As the average cloaker's ability scores are 15 or higher (especially Strength), enemies find it difficult to defeat the monster by inflicting ability damage that drops their scores to 0 or less.

Touch Attacks: Considering the cloaker's aerial mobility, its low Touch AC 12 provides reason enough to prepare spells that rely on touch attacks. A ray of enfeeblement (or two) lowers the risk of a successful engulfing attack, and touch of idiocy reduces the effectiveness of the cloaker's moan attacks (the saves against those attacks are Charisma-based). Shocking grasp, acid arrow, and vampiric touch are effective damage spells, especially if delivered via spectral hand. Finally, alchemist's fire flasks allow easy touch attacks that anyone can make against this monster.

Enjoy The Silence: Cleverly applied, a silence spell suppresses the cloaker's moan attacks while allowing PCs to continue to cast spells at will. Considering its good saving throw bonuses, the spellcaster might be more successful by placing the spell on an area or on a willing recipient that is mobile enough to close with the cloaker and keep it within the spell's radius (or a flying summoned creature).

Sticky Situations: If the PCs need a delaying tactic to ready an assault or make a getaway, solid fog and web work well against flyers such as cloak-ers.

Cloaker

“People blame ‘mad wizards’ for a lot of strange creatures—bulettes, rust monsters, and so on. I used to think cloakers had the same origin, crushed into their current shape by some fool wizard, escaped into the wild to plague explorers, half-mad and hating their own existence. I was wrong. Their origin is much older, much darker, tied to the civilizations before the rise of Old Azlant. Deemed unfit, their masters abandoned them, and they turned to even older horrors for survival. By calling upon powers darker than the deepest oceans, they found madness... and freedom.”

—Hadren Kost, Darklands survivor

Cloakers are bizarre creatures whose interactions with surface folk are almost universally violent. Avoiding the upper levels of the Darklands, they murder unsuspecting visitors, leading many to believe they are little more than aggressive beasts. Cloakers are actually quite intelligent, but cursed with a terrible paranoia that makes them antisocial even toward most of their own kind.

OVERVIEW

Cloakers are inclined to be solitary, as most of them are quite paranoid that all other creatures wish to kill them. Some overcome this fear to the extent that they believe there is safety in numbers, and live with like-minded cloakers for communal vigilance. A rare few throw off the shackles of paranoia (in exchange for a different mental illness) to become leaders of cults. But most cloakers live and hunt alone, preferring the comfort of absolute darkness, where their mental demons quiet themselves to a dull roar.

Gifted with natural camouflage that helps it blend into rocks, a cloaker can rest in one place (often clinging to a wall or ceiling) for hours at a time, lightly sleeping.

If startled, it is inclined to flee rather than fight, as it assumes anything capable of sneaking up on it must be an assassin intent on killing it, and is therefore prepared for any contingencies the cloaker may have thought up. Their solitary nature makes cloakers fringe predators at best, and (ironically) few creatures consider their race a threat worth exterminating. The reverse stands true for cloakers who can get the drop on intruders—if a cloaker can attack with surprise, it usually does so, eager to attack and kill likely assassins before they have a chance to strike themselves.

Cloaker leaders are the exception. These brilliant and charismatic individuals are capable of organizing followers and slaves into dangerous forces, typically intent on striking out at perceived or imagined enemies. Often tainted with some otherworldly power, these cults usually wipe themselves out when facing a greater enemy, or self-destruct in an orgy of suicide and murder... which might be a part of the leader's plan in pursuit of some greater goal.

ECOLOGY

Cloakers bear live young, anywhere from two to a dozen. However, these young actually mature inside leathery eggs carried within the cloaker's body for 9–12 months, hatching internally before the mother expels them from her body. In emergencies, a cloaker can lay these eggs prematurely, leaving them to hatch on their own or (rarely) in the care of a guardian. Cloakers usually reproduce with their own kind, though their paranoia means this may only happen once or twice in a lifetime. They can also breed with Medium or Large rays, though these couplings usually result in imbecile offspring with no supernatural abilities. In emergency situations where an isolated cloaker believes itself to be the last of its kind, they have been known to gestate unfertilized eggs, birthing yellow-gray "vampiric cloakers" that feed on blood.

Once born, a cloaker depends on its parent for the first few weeks of its life, after which it can fend for itself. Most cloakers drive away their young at this point, though cloakers living in a cult prefer to indoctrinate their young and provide food and education for a much longer period. Cloakers become mature and able to breed at approximately age 5. They have roughly the same lifespan as a human, though mental illness and battles with supposed enemies mean that most don't live past age 40.

Despite their size, cloakers are simple organisms and can subsist on small animals, fungus, and even moss or lichen. Their only bone-like structures are their teeth, claws, and tails, and their nutritional requirements once fully grown are minimal. They fly by flapping their wings, but can crawl along the ground in an inchworm-like manner or even lie almost completely flat and creep at half speed like a slug. Cloaker flight is based on strength, not

POTION FUNGI

While cloakers can handle objects with their tails, claws, and mouths, they are not as good as humanoids at dealing with fine manipulation, which makes using potion flasks problematic. To get around this problem, cloaker potion-makers (or someone working on their behalf) invented potion-infused fungal stalks or caps. These function exactly like potions except there is no stopper to remove before using the item—as a standard action, the cloaker puts the fungus in its mouth, chews, and swallows. Potion fungi are usually only 1–2 inches across, and many cloakers impale one onto a grasping claw for easy use in combat (as they have no easy way to carry objects). Other creatures can use potion fungi just as if they were potions, but the paranoid cloakers have been known to add materials that are irritating or toxic to all but the cloaker race, just in case they fall into the wrong hands.

magic, despite a form better designed for water travel than air; it is strong enough to leap into the air from a standing start and fly immediately (much as dragons do in confined spaces). The flat shape of its body means a cloaker can pass through a gap 6 inches high as long as there is room for its 8-foot wingspan; it can fold itself in half or even in thirds to reduce this horizontal requirement at the expense of greater height.

Given their ray-like shape and ability to breed with true rays, it is clear that cloakers are an evolved form of the docile aquatic ray. Their origin is tied to the aboleths, who wanted a race of spies who could watch over their human and skum minions, and even advise or defend key agents on land, yet could never band together to overturn the aboleths themselves. The result of the aboleths' breeding programs and magical experimentation was the cloaker—stealthy, intelligent, and suspicious. They may be distantly related to darkmantles, or darkmantles may be a failed early prototype of the cloakers that escaped and thrived.

Those who study the creatures often speak of the mystery of the cloaker's brain, and how understanding its thoughts or even its words is nearly impossible. The reason for this confusion is threefold. First, cloakers are insane, and that insanity acts as a filter on what they say and think; any sane person listening to one has difficulty parsing when the cloaker is trying to participate in a conversation and when he's merely hearing fragments of the creature's internal monologue. Second, a cloaker's brain is more like a shark's than a humanoid's, and prioritizes information very differently; someone unfamiliar with this quirk may think the cloaker is focusing on trivial or obscure points, but limited evidence from sahuagin and druids with awakened shark companions illustrates that the thought processes and manners of speech are similar. Third, they are the creations of the aboleth, and their use of

certain words and the structure of their sentences can be traced back to the psionic behemoths; those unfortunate enough to talk with both aboleths and cloaklers recognize similarities in their speech.

HABITAT & SOCIETY

Cloaklers prefer solitude. Most are mentally unstable and believe that all other intelligent creatures seek to murder them, so they avoid contact with other beings, rarely forming partnerships with humanoid creatures they can physically dominate—only when a cloakler believes it can easily kill its “partner” does it relax its suspicions. This also means that groups of cloaklers are usually led by an older, smarter, stronger individual dominating younger, naïve, weaker ones.

Sometimes a cloakler’s insanity takes a different form, such as egomania, sadism, or psychopathy. For reasons appropriate to their condition, these individuals prefer the company of others in the forms of sycophants, victims, or collaborators, and become leaders of larger groups of cloaklers. Often such cloaklers become priests of unearthly gods, leading others in chanted prayers to horrors beyond the darkness, or sacrificing victims in the name of unpronounceable, unspeakable evils.

A cloakler will sometimes ally itself with a humanoid creature, typically a native of the Darklands, especially skum who have been cut off from their aboleth masters. In fact, while such alliances are rare, they ironically constitute the majority of surface folk’s encounters with cloaklers, for only in an alliance will the normally isolated creatures venture forth into other societies. With larger humanoid allies, cloaklers are fond of folding over on themselves to hide their tails and faces, posing as nothing more than a heavy cloak. This habit is the source of the term “cloakler,” in fact, and in the absence of a name by which they identify themselves, has become the de facto appellation for their kin. Cloaklers rarely partner with derro (whom they consider insane and untrustworthy), humans, aboleth-bonded skum (whose loyalties are suspect), or sahuagin (too warlike). They never associate willingly with aboleths. Duergar are too rigid for most cloaklers’ tastes and too short for the monsters to easily disguise themselves as a cloak. Drow and cloaklers both have distrustful societies and a tendency to worship chaotic and evil gods, making

them suitable partners once peaceful contact is made. Some cloaklers (particularly the psychopath and sadist types) have gone so far as to learn drow fleshwarping techniques (see *Pathfinder Adventure Path* volume #16) and practice this trade on their own minions. Cloaklers interested in partnering with humanoids sometimes get weave-like patterns tattooed on their backs to help them look more like rugs (when clinging to walls) or cloaks (when worn by other creatures). A few lucky ones have magical tattoos, giving them extra defenses (such as +4 to natural armor or +4 to Dexterity) or spell-like abilities (*mage hand* and *magic missile* are common choices).

The cloakler race was not always as it is now. Long ago, they were merely suspicious, tasked by their aboleth masters with keeping an eye on the skum and human slave races. Able to spy on a leader or cling to an ally like a garment, the cloaklers were well suited for their work. When the humans rebelled against their enslavement, their former aboleth masters destroyed what they could of human civilization. Without human slaves to spy on, the aboleths discarded the cloaklers as well, driving them into the wild places. Bereft of goals and leadership, the cloaklers eventually turned to ancient primordial gods who filled the empty void in their lives with madness, permanently altering their minds. Distrustful of even their own kind except under the best circumstances, the cloaklers scattered, finding places to hide where food was plentiful, yet still compelled by their aboleth-programmed urges to observe and remember. If cured of their madness in such a way that their offspring would also be born sane, cloaklers would quickly become a

powerful force within the Darklands, using their specialized abilities to become information brokers, spies, assassins, and bodyguards.

Many cloaklers find solace in the existence of strange, alien gods that are more insane than any mortal—Azathoth, Rovagug, Shub-Niggurath, Yog-Sothoth, and others—and are comforted by the idea that there are powerful beings out there with no desire to kill them. This is the closest thing to true benevolence a cloakler can understand; they believe even benign deities like Desna and Sarenrae are secretly plotting against them, using a pleasant façade to lull them into a false sense of security before the ultimate betrayal. Most cloaklers are religious in the sense that they acknowledge their weird gods exist and made them what they are today, but few

spend any time performing rituals or praying, mainly because the cloakakers understand that the gods don't care if they are worshiped and any layperson's efforts beyond simple obeisance is a waste of time and effort. Only rarely do cloakakers embrace religion in the way that humanoids do, and these devout cloakakers are usually the ones who replace paranoia with some other mental affliction.

CAMPAIGN ROLE

Cloakers are best used to ambush, annoy, confuse, and terrorize PCs. Their fear generally makes them unwilling to fight extended battles with groups of adventurers, so usually a cloaker encounter sees the creature attacking in a surprise situation, then retreating if it doesn't think it can quickly kill all of its "enemies." If one target looks especially weak, the cloaker engulfs it in the hopes that the others will kill their own ally while trying to hurt the cloaker. A cloaker might lair in a hazardous area, such as a cave with trapped floors, a large pit, or a river of water or lava, relying on these hazards to keep it safe and using its moan and shadow shift powers to hinder the PCs without revealing itself. An egotistical cloaker might aid an ogre chieftain in dominating the rest of his tribe, and when the PCs reach the chief they'll be surprised to find the true power behind the throne—especially if the cloaker is a spellcaster. In the rare cases where a cloaker is sane enough to interact with PCs without attacking or fleeing, they make excellent diplomats and guides through dangerous areas.

TREASURE

Lacking heads, necks, feet, hands, or limbs, cloakakers have difficulties using items designed for humanoids. They can wear rings on their finger-claws and use *ioun stones* and potion fungi (see sidebar), but few other items are suitable for their shape. They prefer small, portable items they can carry in a small pouch (held in the mouth or by its straps), such as magical gems, *figurines of wondrous power*, or *hands of the mage*. Some use magical brooches or necklaces as body piercings near the claws or tail, which function normally despite the odd location. Anything they can't use they bury so that nobody else can use it against them. This means a cloaker's treasure is often kept in a single small bag, typically resting in a niche high above the ground, though greater treasures may be hidden nearby where the cloaker can keep an eye on them.

VARIANTS

While most cloakakers have a fairly uniform appearance, there are several varieties, crossbreeds, and inbred mutations that stand out from the norm.

Amphibious: True to their ancient heritage, some cloakakers can breathe water as easily as air, and have a swim speed equal to their fly speed. Some may have devolved so

much that they cannot breathe air at all, and live only in the waters of the Darklands or the crushing depths of the ocean, perhaps once again serving the aboleths.

Assassin: Cloakers sane enough to work with or for others may study advanced techniques of murder, taking levels in ranger, rogue, and assassin.

Fungoid: Some cloakakers become infested with one or more kinds of parasitic fungi, perhaps from battling Darklands vegpepygmies. Usually these don't bother the cloaker except to increase its appetite to compensate for nutrients stolen by the fungi. These cloakakers usually have large patches of mushrooms growing on their backs, making it less likely they'll be mistaken for a wearable cloak but allowing them to lie flat on the ground and look like a pile of refuse. Some have patches of phosphorescent fungus growing on their underbellies, which they use as lures to attract prey or lead unsuspecting creatures into traps (the glow is blocked if the cloaker clings to a wall or floor). Some achieve a kind of symbiosis with a more dangerous type, such as brown mold, violet mold, or yellow mold. Brown mold fungoids deal 1d6 points of nonlethal cold damage per round to all creatures within 5 feet and take double damage from cold attacks. Violet mold fungoids deal violet fungus poison (MM 113) with every bite and tail lash attack, as well as to any creature striking them with natural weapons or unarmed strikes (CR +1). Yellow mold fungoids release a 10-foot-radius cloud of spores if struck (up to three times per day), with effects equal to yellow mold (DMG 76). Any type of cloaker (assassin, halfbreed, and so on) may become a fungoid.

Halfbreed: These cloaker-ray crossbreeds are looked down upon by all cloakakers, but their slow wits (Int 8) mean they make excellent thuggish minions for normal cloakakers. Halfbreeds are sterile with regard to their own kind, but can breed with rays or normal cloakakers (producing offspring of the same kind as the other parent). A halfbreed's skill modifiers are Hide +5, Listen +3, Move Silently +4, and Spot +3. It does not have a cloaker's normal shadow shift abilities.

Priest: Technically not a separate breed of cloaker but possessing a different derangement, cloaker priests are usually clerics (or more rarely druids) who worship the Great Old Ones; they typically have access to two of the following domains: Chaos, Madness, Knowledge, Rune, and Void (see *Pathfinder Chronicles: Gods and Magic* for information on the Void domain). A rare few priests worship Lamashtu, breeding and birthing insane, monstrous offspring.

Shadowbrood: Believed to be cloakakers infused with the energy of the Plane of Shadow (perhaps by the efforts of the church of Zon-Kuthon), these midnight-black cloakakers are often mistaken for incorporeal undead. They can use their shadow shift ability to produce effects identical to

darkness and *dimension door* (self only). Once per day they may use *maze* and *shadow walk* as spell-like abilities (caster level 8th). (CR +1)

Stinger: Some cloaklers have poisonous stingers on the ends of their bony tails; these cloaklers make a sting attack instead of a tail slap attack for 1d6+5 plus poison (injury, Fortitude DC 16, 1d4 Dex, 1d4 Dex).

Vampiric: The yellow-gray cloaklers born of unfertilized eggs thrive on blood and attach themselves to their prey like leeches. Despite the name, most vampiric cloaklers are not undead; however, explorers have reported vampiric cloaklers that recoil from holy symbols and are damaged by water, so presumably they somehow can become true vampires, though the mechanics for this are unknown. In addition to the normal powers of cloaklers, they have the following abilities. (CR +1)

Attach (Ex): If a vampiric cloakler hits with a bite attack, it uses its powerful jaws to latch onto the opponent's body and automatically deals bite damage each round it remains attached. An attached cloakler loses its Dexterity bonus to Armor Class and has an AC of 16. An attached cloakler can be struck with a weapon or grappled itself. To remove an attached cloakler through grappling, the opponent must achieve a pin against the creature. A vampiric cloakler can use this ability while it engulfs an opponent.

Blood Drain (Ex): A vampiric cloakler drains blood, dealing 1d4 points of Constitution damage in any round when it begins its turn attached to a victim. Once it has dealt 10 points of Constitution damage, it detaches and flies off to digest the meal. If its victim dies before the cloakler's appetite has been sated, the cloakler detaches and seeks a new target.

Webspinner: Created by drow fleshwarping using ettercap and spider essence, these cloaklers can create sheets of sticky webs like monstrous spiders and shoot web nets like ettercaps up to eight times per day. Many of these have poisonous bites or stingers as well.

CLOAKERS ON GOLARION

Aboleths created the cloaklers to spy on their Azlanti thralls, rewarding loyal leaders with cloakler bodyguards and assassins. When the aboleths destroyed Old Azlant, the cloaklers were cast out, fleeing to the Darklands to eke out a living. Most aquatic cloaklers have returned to the service of the aboleths, aiding skum and gillmen as directed, and sometimes acting as contacts or bait for normal cloaklers. The remainder of the cloaklers informally serve the Great Old Ones (see *Pathfinder Chronicles: Gods and Magic*), with a few actual clerics and druids of these gods leading cults of like-minded Darklands creatures, kidnapping, sacrificing, or indoctrinating surface-dwellers.

Cloaklers are native to the Darklands, equally distributed between Sekamina and Orv. They usually avoid Nar-Voth, disliking the humanoid settlements there and the proximity to countless conspirators on the surface world.

Built for stealth, they creep along the edges of other civilizations, eager for news that might help them outwit some imagined enemy, and occasionally preying on a straggling scout or lost exile. The tattoos of cloaklers living among humanoids resemble Varisian tattoos, though these magical markings stem from a much older source.

In the Land of Black Blood, an Orvian vault deep beneath the forests of Kyonin, various tribes battle for their portion of the necromantic substance called the Black Blood of Orv. These tribes—cloaklers, driders, derro, amphibious humanoids, and exiled fiends and genies—harvest this material to sell to ghouls, liches, and necromancers at high prices, and battles over the blood are frequent. The cloaklers here directly or indirectly serve the Moldering Emperor, a very powerful neothelid, banding together in a mutual fear of their monstrous lord and the hostile creatures that share their vault. As their roost is a mushroom forest, they have easy access to fungi suitable for making potions. For more information on the Land of Black Blood, see *Pathfinder Adventure Path* volume #18.

CLOAKER

This flying creature looks like a monstrous manta ray with a long tail ending in a bony whip and horns ending in thumb-like claws. On its pale underside are a fang-filled mouth and two glaring red eyes. Its top side is as black as the darkest night, its belly as white as a dead fish. With wings spreading farther than a grown man can reach, it swims through the air with a strange grace and agility.

TACTICS

Before Combat If a cloaker knows it faces a difficult fight, or a group of cloakers is preparing for a raid, they use their potion fungi (see sidebar on page 11) in advance. They like to harry and disable potential opponents with the nausea and unnerve effects of their moan ability before attacking, counting on the resulting chaos to keep them relatively safe while they pick off the least dangerous foes.

During Combat In an ambush, a cloaker tries to engulf the weakest-looking opponent, hoping to bite the engulfed target to death, perhaps with the target's allies unintentionally "helping" by splitting their damage between the cloaker and its target. Cloakers prefer hit-and-run tactics, killing one target and then fleeing into the darkness, only to return later and repeat the process.

Morale A cloaker has a strong survival instinct, and if it believes its opponents may kill it, it uses its moan ability to create fear or nausea and tries to flee.

SPECIAL ABILITIES

Engulf (Ex) A cloaker can try to wrap a Medium or smaller creature in its body as a standard action. The cloaker attempts a grapple that does not provoke an attack of opportunity. If it wins the grapple check, it establishes a hold and bites the engulfed victim with a +4 bonus on its attack roll. It can still use its whip-like tail to strike at other targets. Attacks that hit an engulfing cloaker deal half their damage to the monster and half to the trapped victim. A cloaker cannot fly while it is engulfing a creature.

Moan (Ex) A cloaker can emit a dangerous subsonic moan as a standard action. By changing the frequency, the cloaker can cause one of four effects. Cloakers are immune to these sonic, mind-affecting attacks. Unless otherwise specified, a creature that successfully saves against one of these effects cannot be affected by the same moan effect from the same cloaker for 24 hours. All save DCs for moan effects are Charisma-based.

Fear: Anyone within a 30-foot spread must succeed on a DC 15 Will save or become panicked for 2 rounds.

Nausea: Anyone in a 30-foot cone must succeed on a DC 15 Fortitude save or be overcome by nausea and weakness. Affected characters fall prone and become nauseated for 1d4+1 rounds.

Stupor: A single creature within 30 feet of the cloaker must succeed on a DC 15 Fortitude save or be affected as though by a *hold monster* spell for 5 rounds. Even after a successful save, the creature must repeat the save if the cloaker uses this effect again.

Unnerve: Anyone within a 60-foot spread automatically takes a -2 penalty on attack and damage rolls. Those forced to hear the moan for more than 6 consecutive rounds must succeed on a DC 15 Will save or enter a trance, unable to attack or defend themselves until the moaning stops.

Shadow Shift (Su) A cloaker can manipulate shadows. This ability is effective only in shadowy areas and has three possible effects.

Dancing Images: This effect duplicates a *mirror image* spell (caster level 6th).

Obscure Vision: The cloaker gains concealment (20% miss chance) for 1d4 rounds.

Silent Image: This effect duplicates a *silent image* spell (DC 15, caster level 6th). The save DC is Charisma-based.

"A robot must protect its own existence, as long as such protection does not conflict with the First or Second Law."

—The Third Law of Robotics, Isaac Asimov

the Ecology of the

CLOCKWORK HORROR

Those races that create mechanical life do so to make loyal warriors, servants, and laborers. Few of these constructs possess any real intellect, much less individuality or free will. There does exist, however, a race of constructs do that pursues its own agenda—to raze the landscape and spread its cold, metallic kind. As these constructs not communicate with anyone but themselves, other races gave them the name clockwork horrors. Merciless, driven, and unstoppable, they possess a strict hierarchy, organized to kill, destroy, and render down resources to bolster their numbers with cold efficiency. They are a mechanical plague upon the living worlds of the Material

Plane and possess no greater mandate than the destruction of all they encounter.

HISTORY OF THE CLOCKWORK HORROR

As clockwork horrors never speak with other creatures, their history, motivations, desires, and thoughts remain forever hidden. Beyond rumors of scoured worlds and lifeless spheres, few even believe these beings exist outside the realms of morbid myths and crazed doomsaying. Yet, survivors of the grinding metal apocalypse that is a clockwork horror invasion pass on similar rumors about the rapacious machines' origins and ultimate intents. Or, at least, those who retain their sanity do.

These tales begin with an ancient people known only as the “Lost Ones.” Wizards, scholars, and innovators, these explorers of far-flung mysteries traveled all across their world, then beyond to the planes themselves. Possessed of insatiable curiosity, the Lost Ones discovered things both wonderful and terrible in their travels, learning what they could and returning home to share their discoveries and improve the lives of their people.

One artificer, inspired by the creatures of Mechanus, took it upon himself to craft a mechanical servant, an adamantine construct of such intricacy as to rival the inevitables of the Clockwork Nirvana. Weaving powerful spells about the contraption, the masterful Lost One inventor bestowed intelligence and great magical abilities upon the thing, granting it life.

In gratitude for its creation, the adamantine machine’s first act was to destroy its maker.

Taking control of its inventor’s vast and secluded magical workshop, the

adamantine horror set to work creating allies to defend it from all threats—which, from its early experiences, it considers all organic life. Within a span of decades it created a host of mechanical servants, each akin to itself in abilities and form but lacking free will, totally enslaved to its cold intellect. When their adamantine master deemed it time, legions of platinum, gold, and lesser horrors flooded the world of the unsuspecting Lost Ones. No defense garnered from countless worlds or planes could turn back the armies of these mechanical monstrosities, and while the Lost Ones fled their conquerors scavenged the ruins of their cities and nations for metal, using it to swell their teeming ranks. In the end, the Lost Ones were either eradicated or scattered to unexplored planes, their home consumed by the voracious grinding of metal gears.

While the death of an entire world is tragic beyond measure, the threat of the clockwork horrors might have been contained were it not for the intervention of another kind of evil.

When a spidership—a star-faring vessel of neogi slavers—landed upon the ruin of the Lost Ones’ world in search of captives, the cruel neogi were intrigued by the race of mechanical insects they discovered. The clockwork horrors ignored the neogi until the aberrant visitors attempted to take a number of the constructs back to their vessel. Reacting to the danger as one, hundreds of clockwork horrors attacked the neogi, destroying the slavers and their captive cargos, ultimately claiming the spidership as their own. Under the direction of the adamantine horror, the constructs unraveled the technology of the neogi spidership, providing them with the ability to ply the stars. Some rumors say that, in thanks for their gift, the neogi’s lost home world was the first to fall to the gears of their beneficiaries’ mechanical war machine.

None know how many worlds have fallen to incursions by clockwork horrors. Only sightings of strange meteors and rumors of metal insects precede an onslaught of clockwork invaders.

KNOWLEDGE OF THE CLOCKWORK HORROR

The following table shows the results of a bardic knowledge or Knowledge (arcana) check as it relates to clockwork horrors. As these constructs refuse to communicate with other beings, any information typically comes from firsthand accounts and magical deductions made by planar sages, doom-saying prophets, and travelers from the stars. Characters can learn more about a specific type of clockwork horror's special attacks by making a Knowledge (arcana) check with a DC of 15 + the horror's CR.

The clockwork horror appears on page 47 of the *Monster Manual II*. The 3.5 update and additional information about these creatures can be found in the downloads sections of wizards.com/dnd.

Knowledge (arcana)

DC	Result
14	Clockwork horrors are intelligent, insectile constructs that destroy everything in their path. They possess a rigid hierarchy denoted by their component metal—the more precious the metal, the more powerful the horror.
19	Clockwork horrors possess a single, linked mind, allowing them all to stay in constant communication with one another. Their face-mounted saws function as magical weapons.
24	Clockwork horrors are susceptible to the effects of a <i>shatter</i> spell, which blinds them for a short period of time.
29	Supposedly, a single adamantine horror leads the entire clockwork horror race. It is thought that destroying this leader might cause its minions to shut down.

Clockwork horrors now undoubtedly travel the dark places of the heavens and, unobserved, increase their numbers in the hidden depths of countless worlds. There they prepare, massing to sweep aside all that is soft and weak, harvesting the materials necessary to multiply their ranks and spread, like a clockwork contagion, to the next, unsuspecting world.

PHYSIOLOGY OF THE CLOCKWORK HORROR

Clockwork horrors are so named because their internal workings are made up of a complex array of gears, screws, pistons, and other machinery. Externally, a clockwork horror resembles a four-legged, mechanical beetle with a body about 2 feet in diameter. Although every clockwork horror possesses a tough frame of base metal, such as iron or steel, each is covered with a thin precious or semi-precious carapace, often etched with obscure symbols. Copper and electrum horrors have very simple, almost blocky craftsmanship, while gold and platinum horrors bear elaborate swirls and other embellishments. Every clockwork

horror boasts a large gem embedded on top of its head. This is one of the few parts of a clockwork horror that shows some form of individualism, as no two gems are exactly alike in shade or cut, although the colors are the same among members of the same variety: purple for copper horrors, green for electrum, blue for gold, yellow for platinum, and red for adamantine. A serrated mechanical saw sits in place of a natural insect's mandibles—the more powerful the horror, the more complex and magically enhanced the saw. Copper and electrum horrors also possess small compartments in their bulbous bodies where they store raw materials, carrying them back to the main group for processing into new clockwork horrors (see the "Creating a Clockwork Horror" sidebar). Gold and platinum horrors contain special machinery that "exudes" processed metal in order to create new horrors.

Clockwork horrors are capable of defending themselves in a variety of ways. The worker caste, copper horrors, possess powerful pinchers, as useful for fine manipulation as for battle.

Electrum horrors come equipped with steam-powered pressure dart launchers, often called spring casters, built into their heads. The bodies of gold and platinum horrors bear special rods attached to the top of their carapaces, each resembling miniature cannons or magical wands, which can cast powerful *lightning bolts* at their enemies. The elusive adamantine clockwork horror possesses a similar wand, a weapon sometimes called the nightmare stick, capable of casting *disintegrate*, *implosion*, or *Mordenkainen's disjunction*.

Like other constructs, clockwork horrors cannot heal naturally. If a horror loses more than half its hit points, the others in its unit tear it apart after a battle and use its materials to create a new one. Less damaged horrors continue to function if possible, although they do not receive any special protection or concern from the others. Clockwork horrors subjected to a *shatter* spell are blinded for a short time but do not suffer the normal effects of the spell.

When destroyed, a clockwork horror's body fuses into a mass of melted metal and the gem on its head disintegrates. This metal, however, can be rendered down to make new horrors. For this reason, clockwork horrors strive to retrieve their destroyed brethren after a battle—a dead horror contains roughly a quarter of the unspoiled resources needed to make a new one. This diminishing return on supply ensures that the clockwork horrors must continually search for new sources of metals and gemstones.

Clockwork horrors communicate through two methods. First, they use their own unique language of short and long clicks, similar to but incredibly more complicated than that which some sailors use to communicate between ships at sea. As of yet, interpreting this language has proven impossible without magical aid. The second method employs their linked mind, which allows every clockwork horror within 10 miles of each other to remain in constant communication, meaning a unit of horrors thinks and acts almost as a single organism. So far, no one has been able to discover the source behind this linked mind ability—

CREATING A CLOCKWORK HORROR

Clockwork horrors exist solely to produce more of their kind. The creation of a new horror requires 200 pounds of iron or steel with which to make the main body, along with 100 pounds of a precious metal. Additionally, there must be a gemstone worth at least 100 gp, although the actual type does not matter. Gold or platinum horrors with these necessary materials can build new horrors (lesser clockwork horrors cannot). Creating a new horror takes three days—two days to craft the main body and a day to cover the carapace with the precious metal overlay and set the gemstone. In order to process the metal, the gold or platinum horror intakes the raw material and exudes it in easily worked strands, much as a spider spins a web. Gold horrors can create copper and electrum horrors, while platinum horrors can create gold and lesser horrors. Four platinum horrors can band together in order to create a new platinum horror—this process requires a week, rather than three days. Despite the creation of bodies, no new clockwork horror is activated until the adamantine horror animates it, an act that supposedly it alone can perform (although some rumors hold that multiple specially made platinum horrors can also animate a new horror). The adamantine horror can activate any new horror body within 5 feet as a full-round action.

it is not based on magic, psionics, or any other energy known to scholars.

Clockwork horrors are powered by magical energy—the large gems in their heads acting as the main source. They do not eat, sleep, or rest, but a gold or superior clockwork horror must “recharge” lesser horrors at least once a month. The superior clockwork horror gives the inferior construct a minor jolt of electricity provided by the rod on its back. If a lesser clockwork horror fails to get this rejuvenating charge, it is affected as per the spell *slow* until it falls into torpor one week later. It remains inactive, effectively helpless, until it is struck by the equivalent of 6 points of electrical damage. If it receives this jolt, the clockwork horror immediately awakens and operates at full capacity. Because of this hibernation, clockwork horrors sometimes create reserves of lesser horrors as backups and reinforcements, awakening them to attack interlopers or to tear apart large caches of ore for processing. Gold and platinum horrors do not require these restorative charges, as they can create them themselves, and the adamantine horror is immune for more mysterious reasons. Clockwork horrors are aware

of any shut-down horror within the 10-mile radius of their linked mind ability.

PSYCHOLOGY AND SOCIETY OF THE CLOCKWORK HORROR

Unlike most constructs, every clockwork horror possesses both intelligence and a certain amount of free will, although how much depends on the type. Copper horrors are virtually mindless and display the least amount of individuality and initiative. Electrum horrors are almost as lackluster, but they are a bit more curious, especially as their main function is to serve as scouts and assess potential resistance. Gold and platinum horrors possess the intellect and reasoning capability to act as true individuals, although even they are enslaved to the whims of the adamantine horror. Regardless, all horrors are utterly loyal and dedicated to the goals of their race. They follow the orders of their superiors without question. While copper and electrum horrors seem to have no compunctions about sacrificing themselves for the common good, gold and platinum horrors show greater caution and senses of self-preservation.

Clockwork horrors exist solely for the purpose of razing and stripping lands for their resources in order to create more of their kind. They are constantly on the move, looking for deposits of metal ore and gemstones. When they enter a new area, electrum horrors scout out a defensible location to establish a base of operation where copper horrors can process ore and gold and platinum horrors can create new horrors without interference—caves, ruined castles, and other protected areas being most appealing. Copper and electrum horrors collect large quantities of rock, ore, and metal in huge piles, which copper horrors then render down into small pieces for use by their superiors. Iron and steel are required in bulk, but clockwork horrors constantly seek caches or veins of copper, silver, gold, and platinum. This desire for ore is one of the reasons why settlements are targeted, as they usually possess concentrations of these metals—especially processed steel. Otherwise, clockwork horrors strip-mine huge swaths of territory, forcing each inch of ground to yield up every single scrap of metal and

THE ADAMANTINE HORROR

The adamantine horror is the supreme leader of all clockwork horrors. It is thought that only one exists, although interplanar travelers who encounter clockwork horrors sometimes report spotting adamantine horrors on different planes and separate worlds. Whether this means one exists per plane or that the reports are simply mistaken, no one knows. Also, while an adamantine horror's main mission of destroying territory to create other horrors is obvious, any other goals remain a mystery. The adamantine horror keeps the secrets of how its race's numbers are maintained and only it knows how to create the spark that animates the bodies of lesser horrors. Much as insects show no remorse or conscience when their comrades perish, though, neither does the adamantine horror appear to care how many of its "children" die in pursuit of the race's goals.

gemstone. When the horrors thoroughly exhaust all the resources of an area, the entire now-enlarged unit moves to a new territory and repeats the process over again.

Unless given specific orders to the contrary, clockwork horrors never venture farther than 10 miles away from the location of an immediate superior, thus allowing them to maintain constant contact with each other through their linked mind ability. If a copper or electrum clockwork horror finds itself outside the range of the linked mind without specific orders, it immediately returns to the last location where it had contact with the rest of the assembly. Gold and higher clockwork horrors enjoy a bit more willpower in this regard and make limited decisions on their own if they must. Groups of scouts might leave a lone gold horror behind when forced to travel beyond the reaches of their superiors' orders—this individual acting as a mindlink relay between the two groups.

The stratified hierarchy of clockwork horrors sometimes works to their disadvantage. If the top horror of a collective is destroyed, the others continue on their original mission, deferring to the orders of the next highest in command, albeit at a slower rate and in a more confused manner. As higher-ranking horrors typically gain farther-reaching goals, like "subjugate this region" or "create 100,000 new electrum horrors," they can often function for lengthy periods without receiving orders. If a clockwork horror completes its goals without receiving new orders it simply shuts down, furthering a gradual chain reaction down the hierarchy.

NEW CLOCKWORK HORROR

The clockwork horrors listed in the *Monster Manual II* are not the only versions known to exist. The lowliest, but most numerous, is the copper horror. These peons serve as workers and, in times of urgency, as fodder in battle. They show little in the way of intellect or initiative and spend most of their time rendering down metal, mining, moving debris, and hauling ore for processing. Despite their crude nature, copper horrors are fast and always appear in large numbers. Their carapace is covered with a dull copper layer, and copper horrors that spend too much time in the elements often bear streaks of verdigris on their joints. Superior horrors have no compunctions whatsoever about sending a copper horror into a situation that spells its doom, as long as it serves the rest of the race.

Besides copper horrors, warriorlike silver horrors are also known to exist, but they fill much the same role and have similar abilities to electrum horrors.

A rusting automaton shaped like a clockwork beetle clicks and whirs as it comes closer, the pinchers on its front legs snapping threateningly.

Shocking Grasp (Sp) Once per day, a copper horror can generate a *shocking grasp* effect, allowing it to deal 2d6 points of electricity damage with a successful melee touch attack.

Linked Mind (Ex) All clockwork horrors within 10 miles of a gold, platinum, or adamantine horror are in constant communication. If one is aware of a particular danger, they all are. If one in a particular group is not flat-footed, none of them are. No clockwork horror in such a group is considered flanked, unless they all are.

Spell Vulnerability (Ex) A clockwork horror is susceptible to the *shatter* spell, which blinds it for 1d4+1 rounds.

The ecology of the cockatrice

by Ed Greenwood

Recently, I asked Elminster if he knew of any folk tales of the Realms involving cockatrices. He thought for a while and then said, "Aye, many mention them briefly, turning some poor unfortunate to stone, but none dwell on their lives and habits. They are thoroughly nasty creatures and presumably are both avoided and ignored as much as possible." Then his face brightened a bit, and he continued:

"Oh, there's one good story. It concerns King Verovan of Westgate (in those days when Westgate had a king), who was a famous sea-master." Following is the tale, just as the old sage related it to me.

King Verovan delighted in rowing-races against any and all who would oppose him, wagering lands, jewels, and shiploads of wine against the freedom of the opposing crew. The king never lost, but delighted in the racing more than the winning. He needed the armies of men he won to replace those of his own rowers whose hearts, arms, or backs had given out under the furious strain of the competition.

There was no place he liked better than the tall afterdeck of his galley, the ship

cutting through the waves while his slaves below heaved and grunted and sometimes screamed at the rowing-benches, and the stroke-drum thundered its beat, and the long whip in his hand leaped as though it was alive, to mark with red the sweating backs of even the prow-bench rowers as he urged his men on.

He raced, and won, for a dozen years, ranging far and wide over the seas and lakes and rivers of the Realms, until he challenged the wizards of Thay, who had, men said, a boat of magic that sat above the waves so that it flew like a bird and its hull and holds stayed dry.

Verovan wanted such a boat, if it did indeed exist, but as a mariner, he wanted to see its strengths and shortcomings first. He thought it might fare ill in a storm, for the winds could blow it about helpless as a leaf severed from its tree — and so, on the eve of a storm, he sent his challenge to the wizards. They accepted, and asked in return for the wager of their ship merely the wager of his own. Moreover, they promised, to settle any fears of magical trickery, that only the merest of their apprentices would crew the magical vessel.

Verovan agreed, delighted at such fairness and courtesy (for the wizards of Thay

had a fell reputation), and the race began. Across a great gulf of the Inner Sea, round an island by a certain headland, and back again to the harbor where the wizards had received Verovan's challenge was the route, and although the strengthening wind blew in great gusts, Verovan plied his whip so eagerly that his suffering men had built up a lead of a league or more before the storm broke.

When the storm came, it was a horrible wall of wind, howling waves, and slashing rain, and Verovan saw with some satisfaction that the grey sails of the wizards' vessel were down in disarray, and the ship was being swept aside by the storm, while Verovan's rowers fought steadily on against the waves and made headway.

The waves grew mighty and broke over the rowers, running down the decks. Verovan seized a set of empty rowing-chains and fastened himself to the lashings of the great steering oar only minutes before an enormous wave swept over the afterdeck, carrying all thereon with it except for the helmsman, the stoker (who, clutching his drum, fetched up in a groaning tangle against the rail), and the king. Verovan's whip and helm were gone, swept out of his hand and off his head by the mighty wave.

The king turned to a chest nearby where spares of these items were kept, and outfitted himself once again — failing to notice that the whip he now grasped was slightly different in appearance from the one he had lost. Verovan resumed his place with angry yells, kicking the stroker upright and urging him on with shouts. The rowers picked up their cadence again, and Verovan held the whip at his side for a while, satisfied with the progress his men were making under the stroker's call.

Shortly after the worst of the storm passed, the king's galley drew abreast of a string of six jagged, rocky islands — which the still-terrible winds and waves sought to drive the ship against. The rowers roared and pulled as though demented, and Verovan again began to ply his whip like a landsman threshing grain.

But the men, it seemed, had been pushed to their limit. The more he struck them now, the more their efforts lessened, and the boat swept down rapidly, sideways on, to the crashing surf about the base of the islands. Verovan redoubled his lashings in fury — and then stopped in sudden horror as the smiling face of the wizard he had challenged appeared in the storm-wracked air before him. The visage looked at him, but did not move or speak.

In a moment Verovan was over his initial shock and had regained his usual cruel composure. "Do you mock me?" the king snarled, cutting through the image with his whip, to no effect. And then, looking away from the evil smile on the face of the wizard-image, Verovan noticed for the first time that most of his men sat at their benches motionless, as though carved of stone — and the rocks were drawing nearer.

"What has come over you?" Verovan bellowed at the statues that were once his men. "Row! Row!" he raged at them, but they did not seem to hear.

Verovan raised his whip yet again — and as the tip of it flew through his field of vision, he saw that the end of the whip bore a barb, shaped like a hawk's tail, made of feathers — cockatrice feathers! The stone-like figures on the benches grasped their unmoving oars, and now the rocks were close enough that escape from them would be impossible.

For the first time, the wizard's smiling face changed expression, breaking into a deep laugh. Then the wizard-image spoke. "It appears that the touch of your new whip is more merciful than the touch of your old one, Verovan. You cannot win the race, and so — you must forfeit your ship."

And with that, most of the galley vanished into thin air — except for a portion of the afterdeck, including the massive steering oar that Verovan was still lashed to. The king's screams were lost in the howling wind as he and the oar crashed into the waiting rocks. And it was in this way that Verovan of Westgate lost his last race.

Elminster sat back, finished with the tale, and I sighed. "A good tale, Elminster,"

I said, "but how can it be true? The wizards of Thay, as you admit, are not to be trusted. Is this not a mere minstrel's fancy?"

The sage shook his head. "Nay, for the stroker survived, thrown up onto one of the isles with his drum, and it is from his lips that the tale comes down."

"It is true, then," I conceded, "as much as such tales ever are. But this says little of cockatrices themselves, only that the wizards placed a magical whip in Verovan's gear — a whip of cockatrice feathers that petrified as though the creature still lived."

"Aye, I have details of that process," Elminster replied. "And I can tell thee something about the creatures themselves, besides." He then did so, and I made careful notes, so that I can summarize his remarks as follows:

The cockatrice is an unintelligent, nasty, avaricious creature, about the size of a large goose or turkey, that often flies into a fit of rage. The creature is infamous for the (permanent) *flesh to stone* power of its touch, but man is not its deliberate prey. Its habitat and habits are little known, and much confused by myth and old wives' tales. What follows is, however, known to be true, as far as it goes.

Males are more numerous than females (which lack the wattles, and have much smaller combs), and the latter are very seldom without a mate — or several mates, who will fight constantly among themselves over the female.¹

Cockatrices are immune to their own and fellow cockatrices' petrification powers, and spend much time strutting, fighting among themselves, or foraging. A male-and-female pair (or the more unusual grouping of one strong female with several "consort" males) will mate often and noisily, screeching and cackling all the while. The female will lay a clutch of 1 or 2 eggs a month, at the waxing of the moon, which she guards watchfully while the male (or males) hunts food for her. The eggs are brownish-red, flecked with rust-red speckles, and they have hard, brittle shells. An egg that is fertile² will hatch in 11-19 days. An immature cockatrice is small (roughly fist-sized), but otherwise identical in appearance to its parents.³ Such chicks grow to mature size and attain full powers in four to six months. They are then driven away by the parents, left to fend for themselves.

Cockatrices are vain, bullying creatures, and amongst themselves there is a constant battle for status. Nesting pairs consider themselves above solitary creatures or those who do not have a nest, and once a lair has been found, the cockatrice pair will build a permanent nest and continually enrich it (and thus their individual status) by lining it with treasure.

Status increases with the shininess and quantity of treasure, and there must always be the yellow gleam of gold somewhere among it for the owner to achieve true "class." Cockatrices are thus always foraging for food and treasure. Their preferred

BUSHIDO™

Flashing bladework, brave warriors, martial mastery, wise priests, honor, stealthy assassins, demons, magicians, spirits, war — the stuff of Legends, the Legends of Japan. BUSHIDO is a role playing game that allows you to adventure on the Misty Isles of Nippon.

Players in BUSHIDO design their characters to suit the profession they choose. A skill system is used to determine the character's success in both martial and peaceful endeavors.

Take a break from the Western European and sample the mysterious world of the Far East. Try adventuring in a world where a man's honor and fame are as important as the number of foemen he has slain.

Come follow the code of the Samurai, the Way of the Warrior. BUSHIDO!

BUSHIDO is available for \$18.00. Also available is THE VALLEY OF THE MISTS, a BUSHIDO adventure pack for \$5.00.

diet consists of large, juicy beetles, small lizards, and snakes, although a cockatrice will eat all small reptiles, birds, mammals, seeds, fruit, and even fish it can catch, often subsisting largely on rodents.

It is important to note that the cockatrice can choose not to petrify by its touch (if it could not, it would never be able to eat), but this is a conscious, deliberate act of will on its part, and at all other times its touch automatically petrifies.⁴ Be aware, however, that the *flesh to stone* power of the cockatrice is just that — its touch only affects the actual flesh or body of a creature, and does not work through (or upon) clothing, armor, or other inanimate objects. Thus, someone covered in head-to-toe armor has little to worry about — but someone with any sizable patch of flesh showing is in danger, for the cockatrice knows instinctively where to strike to bring about the “stoning” effect, and will aim for the vulnerable spot.⁵

Cockatrices are not strong flyers, but prefer to fight in the air against foes they deem dangerous, because they move more quickly when airborne than when on the ground. They can grapple opponents while flying, petrifying them upon a touch — whereupon most foes fall helplessly to earth.⁶

Cockatrices will never leave a nest unguarded, and will fight to the death to protect eggs or young. If a clutch of eggs happens to be entirely infertile, the parents

will leave that nest (and its treasure) and go elsewhere to nest, never returning to the former location, which they seem to hate and fear; apparently they consider it cursed, bad luck, or somehow contaminated.

Large groups of cockatrices encountered are usually young driven from the nest, all of one sex and temporarily together for safety and mutual hunting strength, or several males who have located, and are now vying for the attention of, a female.

The most feared foe of the cockatrice is the pech. This creature, being immune to petrification, hunts cockatrices with impunity both for food and trade. This trading, conducted via *svirfneblin*, results in a few secretive sales of live cockatrices to alchemists, paranoids of all types seeking guardians, jaded collectors of exotic pets (cockatrices sell for 500-1000 gp, eggs for 300-600 gp each), and so-called sculptors. (A famous “sculptor” in Waterdeep once plied his trade by drugging human models, posing them, and then releasing his pet cockatrice upon them.) Cockatrices are generally too stupid to be easily trained, but they can be taught (by repetition) to recognize their owner and carry out the simplest of commands given by that owner, so long as those commands do not go against the creature’s basic nature.

Notes

1. The cockatrice depicted in the *Monster Manual* is a male (males outnumber fe-

males 65% to 35%). Cockatrices may live as long as thirty winters, but the normal lifespan (assuming the creature survives infancy) is 16-20 years.

2. There is a 65% chance for each cockatrice egg laid that the egg is fertile and will hatch. This chance drops by 5% if the egg is abandoned by the mother or she is slain before it hatches. Eggs that do not hatch are eaten by the growing chicks.

3. The only substantial difference between an adult and an immature cockatrice is that the petrification effect of an immature cockatrice’s touch is saved against at a +3 bonus.

4. The willful switch from petrification to non-petrification or vice versa is effectively instantaneous (taking less than 1 segment), and is believed to be both a mental and a chemical change. The direct touch of any part of a cockatrice’s body causes petrification within 2 segments (unless the victim makes a successful saving throw). A cockatrice has a partial, intangible existence on the Astral and Ethereal planes as well as its corporeal existence on the Prime Material. This intangible existence consists of an aura corresponding in shape, size, and location to its physical form, and its aura petrifies on the Astral and Ethereal planes just as its body does on the Prime Material.

When a cockatrice chooses not to petrify, all parts of its body (and on the Astral and Ethereal planes, all parts of its visible aura) become “safe” (and invisible on the Astral

BIRTH ANNOUNCEMENT!!

Southern California forms...

A NEW Game Company...

DTI stands for **Diverse Talents, Incorporated**, a new California Corporation owned and operated exclusively by Adventure Gamers looking for ways to improve the hobby.

The founders of this young company have united under a far seeing, strong common philosophy that this hobby can gain more public acceptance and obtain substantial future growth by becoming more “social” in its endeavors and reaching out to average people through their very game closets. We are out to: 1) Unite ourselves, the “hard core” Adventure Gamers, and 2) Broaden our size and acceptability within the general public.

And a NEW Game Magazine...

To bring us, the common Adventure Gamers, together there must be first a common need shared, and that would be information. To that end, DTI’s first endeavor is the founding of **The V.I.P. of Gaming Magazine** (the V.I.P. stands for “Variants, Interviews, and Profiles”).

While primarily a variant/review oriented magazine on all aspects of Adventure Gaming by subject (Role-Playing, Wargames, Family Games, Computer games, miniatures, sports games, Play-by-Mail, books, movies, etc.), **The V.I.P. of Gaming** will also provide a forum for your letters as well as provide the history and insights (not to mention the rumors) of the game industry today.

Which needs NEW Writers (like You)!

The format for **The V.I.P. of Gaming Magazine** is a “fast food” approach of short variants, clarifications, and tournament rules (of ¼ to 1 page in length), scenarios (½ page or less, if possible), and reviews (brief/capsule style of about 500 words). This slick, professional 48 page magazine needs you. the uncommon gamer to sustain its “shotgun” article approach with your home made variant ideas and intelligent reviewer’s opinions on your own, personal favorite game subjects.

Do you have an idea or opinion to share with your fellow Adventure Gamers? If so, then together we can all help each other directly through the contributions of each individual. Please, help improve your hobby by contributing to it! Write for **The V.I.P. of Gaming Magazine!**

**For questions, comments or more information,
DTI and THE V.I.P. OF GAMING Magazine can be contacted at:
P.O. Box 8399, Long Beach, CA 90808.**

and Ethereal planes) — except for the feathered end of its tail. This remains active at all times, able to petrify all living things it touches. Note that a cockatrice is well aware of this, and — not wishing to petrify its food — has careful and exact physical control and precise knowledge of the location of its tail. Note also that if a group of two or more cockatrices is encountered feeding, only one at a time actually “turns off” its petrifying power and eats; the others stand guard.

The cockatrice’s petrification power does not “turn off” automatically when the creature falls asleep or is rendered unconscious, but a dead cockatrice does not retain the power — except for the uncontrollable “stoning” power of its tailfeathers, which remains in effect for 1-4 days after the creature’s demise. (Saving throws against petrification by the tailfeathers are made at +1 if the cockatrice is dead or the feathers have been separated from the creature.)

Some mages (see Elminster’s tale, above, and AD&D® game module WG5, “Mordenkainen’s Fantastic Adventure”) have devised means of preserving the petrifying powers (and physical integrity) of cockatrice tailfeathers. One such method (from the notebooks of Arbane the Mighty) is reproduced here:

For the making of whips, hats, cloaks and the like adorned with cockatrice tailfeathers, the feathers must be magically preserved. To do this, take a cauldron, and into it pour equal parts of *oil of etherealness*, *aqua*

regia, and human tears (at least half an ounce of each). Mix this liquid well with a glass or crystal rod, and heat it to boiling while stirring in at least 6000 gp worth of powdered agate and either six whole (live or dead) cerebral parasites or the blood (7 drops or more) of a slaad, a githyanki, or a nightmare.

Stir this mixture until the solid components are dissolved, and then immerse the cockatrice feathers in the liquid while it is boiling. (A *mending* spell must be used beforehand on the feathers if they are broken, bent, or crumpled.) Take the cauldron away from the heat immediately after putting the feathers into the liquid, and let the cauldron stand until the liquid evaporates.

The cockatrice feathers will then be intact, resilient, and flexible, and will remain so forever (unless damaged or destroyed), retaining the power to permanently petrify living creatures (save vs. petrification at +1) by touch.

Feathers preserved in this fashion can only affect other creatures by direct contact on the Prime Material Plane or on the plane occupied by the bearer of the feathers; they cannot simultaneously affect creatures on the Astral or Ethereal planes or any other plane except the one that the feathers are physically present on.

5. If the flesh of a cockatrice’s opponent is revealed to any substantial degree (bare arms or bare legs, for instance), it can be assumed that a hit by the creature in melee

has struck the vulnerable part of the target’s body, and thus petrification is possible. If a would-be victim is almost entirely covered (only showing a bare head, bare hands, or bare feet, for instance), then the Dungeon Master must use judgment to determine the outcome of a cockatrice strike. For instance, it might be ruled that after a successful “to hit” roll, the cockatrice has a chance of striking exposed flesh, and that chance is equal to the approximate percentage of the victim’s body which is uncovered (perhaps 10% for bare feet, 15% for bare head, 25% for bare arms, etc.). Then, if that percentage is achieved on a second roll, the cockatrice has succeeded in striking the exposed flesh. (If more than one quarter of a target’s body is exposed, it can be assumed that the cockatrice automatically lands its strike in that area.) The victim is always allowed a saving throw to avoid the petrification effect, but even if the save is made the target will take damage from the strike of the cockatrice’s beak.

6. Cockatrices are of maneuverability class C, and must rest for at least 1 turn after 2-5 turns of flight. (How fast each creature tires depends upon the strength, weight, age, and present condition of the individual cockatrice.) Note that the creature’s aerial movement rate is fully three times faster than its ground movement; the cockatrice is well aware of this, and often uses short, flapping flights to pursue prey or escape immediate danger. ☞

Brighter than diamonds, sharper than glass

by Rudy Thauberger

Talla unwrapped the glass shaft and handed it to Quarr. "Be careful now," she said, "If you grip it too tightly the edge will cut you to the bone."

Quarr held the glass in the palm of his hand, watching the light of the fire play of its surface. The edges were straight and remarkably sharp. "It's beautiful," he said.

Talla sneered. "Beautiful," she said. She leaned close and pulled back her hair. A web of scars ran down the side of the half-elf's face, from the tip of her ear to her jaw, each scar running across half a dozen others. "Is this your idea of beautiful?"

Quarr stared, afraid to speak. He looked down at his feet until Talla settled back next to the fire. The ranger made him nervous. He had paid her a fortune to teach him how to survive in the wilderness. As a merchant, he felt that the knowledge would serve him well on long caravan journeys. So far though, all she had done was drag him out into the desert and scare him with tales of monsters he never knew existed: kirres, agony beetles, sand cacti. After a week of it, he wanted nothing more than to return to the relative safety of Balic and never leave again.

Talla seemed to sense his anxiety. She smiled. "Ah, but you are correct," she said, "A crystal spider standing in the heart of its web is one of the most beautiful sights I've ever seen, and very nearly the last. Listen closely now, merchant, for I will tell you all I know about this terrible beast."

The first thing you must understand about the crystal spider is that it may not be a spider at all. Its crystalline shell and glass webs are unlike those of any other spider on Athas. Most sages suspect that it is a creature of magic, created by a defiler or perhaps even a sorcerer-king as a weapon. Others claim that it is a mutation, spawned by the rigors of the Athasian wilderness. Even others say that it is a creature from a different world, or that it was a spider once, but has since become something else. Its appearance is merely an echo of its heritage.

Most travelers, when they first see a crystal spider, are astonished by its beauty. In full daylight, the spider scintillates with every color, shimmering like a desert mirage. It resembles a creature of living glass, magical and—like much that is beautiful on Athas—extremely deadly. Few realize that most of what they see is, in fact, not living tissue at all, but an unliving crystalline shell animated by the power of the Way.

THE ECOLOGY OF the Crystal Spider

The living tissue of the crystal spider has a vaguely spiderlike shape when removed from its shell, but it is soft, boneless, and capable of only rudimentary movement. The body is a round segmented sack with eight long and several short ganglia extruding from it. These ganglia extend into the creature's legs, mandibles, and sensory organs. While safely hidden inside its shell, the spider's tissue is transparent, except on those occasions when the creature has recently fed on blood. At these times, the tissue turns faintly red, bringing a blush to its crystal shell. Once the tissue is removed from the shell, it blackens rapidly, especially if exposed to direct sunlight.

The shell itself both supports and protects the soft tissue, allowing the spider to move while shielding it from exposure. The tissue is nourished largely by sunlight, and the spider can survive for extended periods on nothing else. The hard outer shell is crucial to the spider's survival, focusing and amplifying the sunlight so that the spider gains the maximum benefit from every moment spent under the sun. The shell also retains heat, allowing the spider to remain active at night.

In spite of this highly efficient feeding system, the crystal spider periodically needs to ingest the blood of living creatures. Some say that it actually requires the blood of humans. The spider may prefer human blood, but I suspect any animal's blood will do. What is certain is that without an infusion of blood at least once a month, the crystal spider weakens and eventually dies.

Blood provides the spider with the

essential nutrients it needs to manufacture the two substances necessary for its long-term survival: first, a sticky goo that hardens into a tough, sharp-edged crystal; and second, a powerful acid that dissolves the crystal and serves as the source of the creature's poisonous venom.

The spider uses these two substances to build its shell. The crystal coats the spider's body and ganglia, building up layer upon layer, shaped by judicious applications of the acidic venom. Once completed, the shell is animated by the spider's psionic powers. The animation takes the form of a telekinetic field that radiates from the creature's ganglia. In moments of crisis, the spider strengthens the field, creating a barrier against missile attacks.¹

The shell is several feet thick in places, giving rise to the notion that the creature is entirely made of crystal. The joints are lubricated by a diluted form of acid venom, which allows the spider to move quickly and silently. Most spider hunters, in fact, underestimate both the speed and the amount of noise a spider makes, thinking that something so big and solid should be clumsy and noisy. They fail to realize that, since the motive power of the creature comes from psionics rather than muscles, the spider can move with uncanny grace and precision. Fortunately, the crystal shell is vulnerable to *shatter* spells and other magic that affects glass and glasslike substances.²

In combat, the spider's crystalline forelegs inflict great damage and are remarkably strong. The creature's bite is its most feared attack, due to its venom.

Because the spider's venom is highly acidic, it quickly destroys all the flesh it touches. Most victims die quickly and in great pain, and those who survive suffer terrible burns from the acid and are often crippled or disfigured. If that were not enough, the spider's telekinetic powers extend to fine control over the very light it feeds on.

The spider's ability to control light has several functions beyond combat. It uses the power to communicate, to hide itself in shadows, and to illuminate its surroundings. When combined with the creature's glass webs, the power becomes deadly.

The crystalline webbing, on its own, is dangerous enough. Sharper than an obsidian blade, it is also nearly invisible. Because the spider doesn't hang from its web like most spiders, its web can lie on the ground or hang like a curtain, as long as it is exposed to sunlight. More than one adventurer has been crippled by walking over strands of the web laid out on a valley floor. More have suffered terrible wounds by walking into an invisible web hung between stone pillars or narrow canyon walls.

In addition to cutting damage, the spider's web can focus and amplify its ability to control light, producing an intense burning beam. The beam generally originates from somewhere near the center of the web, but not always. As long as the point of origin is more than 5' from the edge of the web, the beam can come from any point on the web.

Most spiders use the beam as their primary form of attack, but the control the crystal spider exercises over light creates effects other than heat rays. A few spiders can produce bright rays of light to blind or stun their victims. Others produce glowing balls of light that confuse and distract their foes. There are even rumors of crystal spiders that can create images of themselves on their webs, to deceive their enemies and lure them into traps.³

The strategies crystal spiders use to hunt prey are fairly complex. The creatures are smarter than most animals, although not highly intelligent by any means. However, they should not be underestimated, especially when it comes to the construction of their webs. They are experts at concealing the web's razor-sharp threads of glass, and they use a number of strategies to drive their prey into the heart of the webbing, where the victims are cut to pieces while trying to escape. Crystal spiders often create more than one web in a single location, one obviously visible and the others hidden, covering potential avenues of escape. The spider then uses its heat ray or other abilities to herd victims into a web. There is a limit, however, to how much webbing the spider can effectively hang, because the webs must be cleaned, lubricated, and repaired on a regular basis. Without proper care and repair, the spider's webs collapse.⁴

Among the elves, the webbing serves as

raw material for short blades, such as knives and spears, as well as arrowheads. Once removed from the care of the spider, the glass grows brittle unless polished and lubricated with oil. The blades must be replaced regularly because they tend to shatter after being wielded in combat a few times.⁵

The crystal spider reproduces only once in its lifetime—just before it dies. In order to reproduce, it weaves a large hatching web. Like its regular web, the hatching web is carefully positioned in relation to the sun, allowing the spider's gemlike eggs to absorb a maximum amount of energy. The web's razor-sharp edges deter most predators from raiding the eggs.

The crystal spider does not actually lay eggs. Instead, it constructs the egg's shells out of its own webbing material or from gems taken from unlucky travelers. The acid venom opens a hole in the gem, into which the embryonic spider is placed along with a supply of blood. The spider then seals the hole and sets the egg into the hatching web, where it is exposed to the amplified rays of the sun. Up to 200 eggs can be prepared, depending on the size of the hatching web. The strain of preparing the web destroys the spider's ability to produce additional webbing and venom, and it severely weakens its ability to absorb sunlight. Most spiders live only a handful of days after completing their last great project.⁶

After a few weeks, the tiny spiders begin secreting acid that dissolves the gems, and they hatch. Once they emerge from their shells, the majority of the tiny crystal spiders fall victim to the very sunlight that grants them life. Without a shell to focus and harness the sun's energies, the spiders grow sluggish, and their soft tissues lose moisture. The first thing a newly hatched crystal spider must do, therefore, is to spin itself an exoskeleton. This first shell is usually crude and clumsy, but once constructed, it allows the spider to move and hunt. Because the acid dissolves the exoskeleton, the crystal spider can easily modify and improve its shell in sections without shedding it completely. Usually no more than a single limb is exposed at one time.⁷

Once they complete a shell, the young spiders begin looking for sites to build their first webs. A few remain near the hatching web, but the solitary nature of the crystal spider and the lack of sufficient resources eventually drives all but one away.

The shell of a dead crystal spider quickly loses its beauty. Without the oils provided by the spider's venom, the shell's luster fades, and the crystal dries out and cracks. Within a few weeks, the shell breaks apart, becoming little more than a handful of worthless pebbles. Ω

Notes

1. DMs may opt to substitute the Telekinetic Barrier power described in *The Will and the Way* for the Inertial Barrier power normally used by the spider.

2. Other spells that can affect the spider's shell include *shout*, which inflicts 6d6 hp damage, and *glassteel*, which actually improves the armor class of the creature to -4.

3. By manipulating light, the spider can duplicate such spells as *color spray*, *dancing lights*, *phantasmal force* (spider's image only), and *mirror image* (1d4+1 images).

4. The maximum amount of webbing the crystal spider can effectively tend is roughly 1,200 square feet. Each new web increases the spider's need for fresh blood, so generally a crystal spider spins no more than two 400 square foot webs. The exception is the hatching web, which is much larger than a normal web. Because the spider produces only 12' of webbing per day, the construction of even a small web is time-consuming. A 400 square foot web takes 13 to 20 days to construct (12+1d8 days). Twelve additional days are added for each web the spider must maintain while building the new web. If a web is left untended for more than six days, it must save vs. crushing blow each day until it collapses.

5. Blades must be oiled at least once a week. Each week without oiling results in a cumulative -1 modifier to the blades' saving throw vs. crushing blow. Such a save is rolled at the beginning of every melee. If the saving throw fails, the blade shatters within 1–4 rounds.

6. Each egg requires 50 square feet of web to nourish it. Therefore, a web capable of producing 200 spiders would have to cover roughly 100' x 100'. The gestation period is roughly 40 days, and all eggs hatch within 1-3 days of each other.

7. The newly hatched spider has an AC 10 and 1d4 hp. Once it has constructed its first shell, which takes only a few minutes, its AC improves to 7 and its hit points double. Within a few days, the AC of the shell improves to 4 and the spider can fight with an THAC0 of 19, inflicting 1d4 hp damage with its forelegs and biting for 1d2 hp damage. Since its body is constructed, rather than grown, the crystal spider can achieve its full adult size in less than a year, depending on the available supply of blood.

THE ECOLOGY OF THE CYCLOPSKIN

Brokk's Lucky Day

All Brokk had
to do was
keep his eye
on the slaves.
How hard
could it be?

AS USUAL, BROKK WOKE TO THE BITING OF FLEAS.

He sat up in the filthy nest of uncured hides that comprised his bed, yawning. Scratching the side of his belly with one hand, he made a quick darting motion into his matted hair with the other, snatching at one of the irk some fleas that plagued his existence.

As usual, the flea avoided his grasp.

Brokk spent the next few minutes, as was his custom, groping through the thick, black hair that framed his head,¹ hunting for pests. The fleas, as was their custom, avoided his probings, but he did manage to catch a few lice. These he popped into his mouth as a snack, crunching absently as he rose to face the day.

The others were stirring as well. Gulokk, the leader, rolled the boulder from the cave entrance, the morning sunlight falling over his well-muscled arms. As the strongest male, he was the leader of the cyclopskin band, so the duty fell to them—mostly as a reminder to the other males in the band as to just why *he* was the leader, not them. Brugar

and Turogg, weapons in hand, stood ready to defend the cave should anything be waiting to pounce upon them as the boulder was rolled away.² Even Old Gork, wounded in the leg from a bad fall some fifteen winters ago, had a part in the morning ritual: he stumbled over to the women and kicked them awake with his twisted foot.³

1. Cyclopskin hair is long, shaggy, and unkempt, a haven for lice, ticks, and fleas. Usually black, it can also be a dull, deep blue. Grooming is uncommon; usually a cyclopskin just tucks his hair behind his ears to keep it out of the way.

Members of both sexes lose their hair at an early age. By the time a cyclopskin enters adult society he's already thinning on top, if he doesn't already have a full-fledged bald spot. By age twenty-five, most cyclopskin are completely bald. They don't mind the lack of hair, since it keeps the vermin at bay.

In addition, cyclopskin don't grow facial hair, so beards and mustaches are unknown among the race.

2. Many creatures prey upon cyclopskin: tigers, wyverns, giants, and trolls, to name a few. As most cyclopskin bands live in permanent lairs, their locations are often known to the larger predators in the area. Mountain dwarves even go out of their way to attack cyclopskin, receiving the dwarven bonus against giants when doing so. For this reason, cyclopskin block their cave entrances with boulders or a stout wooden gate when they retire for the

night. Cyclopskin caves always have but a single entrance; any naturally occurring additional entrances are sealed off with boulders and large stone slabs by the cyclopskin before they inhabit it.

3. Cyclopskin society is completely male-dominated and led by the strongest male. The weaker males follow his lead only through fear. Females and children are in turn subservient to the males and occupy the lowest niches of cyclopskin society. Cyclopskin have nothing but disregard for those weaker than themselves, even members of their own tribes or clans. Thus, the leader is brutal to everyone; the weaker males obey the leader but are in turn brutish to their mates and children. Cyclopskin children, if they're lucky, can vent their frustration on the clan's slaves. If the clan has no slaves, they just bide their time in silence until they are big enough to fight back successfully. Most cyclopskin clan leaders are killed not by one of the many creatures that habitually prey upon cyclopskin but rather by another male of their own clan that has had enough of subservience and has decided that it's time he gets to be the boss.

by
Johnathan M. Richards

illustrated by
Matt Mitchell

A cold, strong wind blew into the cave entrance. It brought in fresh, mountain air, contrasting sharply with the stench in the cave: the smells of the slaves and sheep penned in the back, the dung and offal strewn about all parts of the floor, and above all, the unwashed bodies of eight cyclopskin.

The fresh air felt good to Brokk. His thick skin protected him from the worst of the low temperatures found in the mountain environment.⁴ He wore only a ragged loincloth of moldering cave bear skin and scraps of the same skin tied around his feet with leather cords. Thus garbed, he could walk among the snow-covered peaks with little discomfort.

The slaves were not so lucky. There were three: a human male with gray hair covering his lower face like a dwarf; a human female, light in complexion and nervous in mannerisms, constantly looking about her with fearful, darting glances; and a pointy-eared elf male who said little but whose face betrayed constant resentment toward his masters. The elf had but one good foot, the other having been chopped off by Gulokk after a failed escape attempt—now he had little more than a heel where his right foot had been. The loss of his foot had soured his attitude, and he spent his days moping about the unfairness of his lot in life. The slaves no doubt had names they used among themselves, but to the cyclopskin they were simply “Man,” “Woman,” and “Elf,” or else “Slave” if it didn’t matter which one was being called.

The three of them huddled together for warmth in the corner of their pen, shivering in their thin garments. When they had first been captured half a year ago, they had each worn fine fur cloaks. Those cloaks now graced Gulokk’s muscular frame, not for the warmth they

provided, but rather because the furs had actually been cured and carefully sewn, not peeled off of a kill and pressed into service as clothing immediately afterward.

Mooga, belly swollen in late pregnancy and in a foul mood because of it,⁵ opened the slave pen and growled at the slaves to get out. Woman jumped up at once and complied, fearing retribution; Man stumbled up wearily on old, stiff bones but followed Woman out of the pen. Elf, as usual, sat where he was and stared insolently at Mooga, daring her to come get him. She growled again; he stayed put. She took a step into the pen and he stood up slowly, stretching, as if just now deciding to get about the day’s

business. He hobbled leisurely out of the slave pen and followed Man and Woman toward the sheep pen. Mooga didn’t dare hit him, for fear of punishment herself if one of the males saw her.⁶

The band kept a small herd of sheep as an easy source of food. Not only did the sheep provide wool for the clan, but they were also a backup source of food when hunting was slim—or when the cyclopskin just didn’t feel like exerting the effort necessary for hunting. With the sheep, meat and milk (and now cheese, thanks to the skills of Woman) were always available. The animals were kept in a separate pen to prevent one of the slaves from killing and feasting on a sheep in the middle of the night—it wouldn’t be hard to imagine them doing so, since the slaves were fed so little.

4. A cyclopskin’s tough hide grants him a natural AC of 3. Because their thick skins provide them such ample protection, cyclopskin never wear armor and seldom carry shields.

5. Cyclopskin life expectancy being somewhat short (reaching the ripe old age of fifty is quite an accomplishment), cyclopskin women are kept pregnant as much as possible. This brings more clan members into the world, replenishing the ones who are killed in raids against enemies and power struggles within the clan. Due to the poor treatment of the pregnant mothers and the unsanitary conditions of cyclopskin dwellings, miscarriages are

frequent, and infant mortality ranges from 10–20%.

A female cyclopskin has little to look forward to in life. Her gender puts her at the bottom of cyclopskin society straight from birth. Almost immediately after puberty, she becomes little more than a brood mare, delivering baby after baby and still being treated as little more than a slave herself. Worse, her sons eventually grow up to become adult males who treat her as badly as the others. Eventually, she will no longer be of childbearing age—at which point she is unceremoniously banished from the tribe to survive on her own (rather than be allowed to drain the tribe’s resources).

6. Technically, cyclopskin females are higher in rank than are slaves in cyclopskin society. However, cyclopskin value their slaves highly, since a slave can be forced to do a great deal of work that the cyclopskin would otherwise have to do for themselves. A slave’s value grows higher the fewer their number: if a tribe owns twenty slaves, no one’s going to mind a female abusing a slave or two. However, if there’s only a small handful, the females had better keep their hands off the slaves. As might be expected, this only leads to further resentment on the part of the females.

Brokk watched the slaves at work for a while, absently picking lice from his hair and staring in fascination at Woman. She, like the other slaves, was somewhat ugly, with two eyes and that preposterously skinny nose that went all the way to her forehead.⁷ He supposed she was good-looking to other members of her race, but try as he might Brokk just couldn't see the attraction. He compared her to Gruba, the favored female of the tribe.⁸ Gruba was truly beautiful: the classic, wide nose with gaping nostrils, the hairless scalp that glinted in the sun. Even Little Aga was better looking than Woman, and she was only three, still a few years from adulthood (unlike Brokk, who at age nine was standing on the brink of being a full adult member of the tribe).⁹

Woman caught sight of Brokk staring at her, and her eyes widened in fear.¹⁰ Brokk granted her a wide smile, revealing a mouth full of crooked teeth. She jerked her attention back to the sheep she was milking and pretended not to have noticed. But Brokk knew better. He grinned to himself, pleased at the fear she felt. It was a good feeling, he thought, making smaller creatures fear you.

Brokk's reverie was broken by a slap to the back of his head. "Quit yer

daydreaming, boy!" spat Old Gork. "Fetch me some meat!"

Brokk grimaced but did as he was told. Old Gork, while badly crippled in one leg, was nonetheless still strong for his age—stronger than Brokk, anyway, which was all that mattered. Brokk walked over to the bone pile, where the remnants of last night's dinner had been pitched. Digging through it, he found a few well-gnawed bones (the rats had been at it again last night, he noticed) that still had a few chunks of meat on them. Tossing them to the old cyclopskin, Brokk reckoned that in another year or so he'd be able to take on Old Gork—and then it would be the old male fetching him his breakfast. Now *that* was a pleasant thought!

Old Gork settled down in a corner and chewed on his bones. Brokk moved back out to the cave entrance, eager to see what the other males were up to. On his way he passed the tribe's good-luck mascot, Watcher—a gurokka Gulokk had captured and dragged back to the cave.¹¹ Watcher floated serenely near the cave entrance, tethered by a short rope tied to a large rock that prevented it from straying and harming the slaves or sheep. The gurokka served several purposes: it was a line of defense for the cave, a tribal pet

requiring little upkeep, and a constant reminder of the days when the tribe had served a beholder-god, Jzemnix. Fortunately, the adventuring band that attacked the tribe and their god had managed to slay Jzemnix before being overcome themselves by the cyclopskin. That had been a truly lucky day: the tribe had not only gotten rid of their god but also gained their three slaves!

Gulokk and Brugar were gathering weapons, preparing for a hunt. They each selected three sturdy spears from the tribe's stock; each warrior grabbed up his lucky bardiche as well.¹²

"I will go with you," offered Brokk, eager as always to be accepted into the company of the adults.

"You will stay here with the females and the slaves," countered Gulokk, equally eager to keep irritating children from his presence whenever possible. "Make yourself useful, though, and grab a skin of kragh."¹³ Brokk did as he was bid and watched the two males saunter off down the mountain. "I will guard the cave!" he called to the leader; Gulokk merely waved his hand as if swatting an annoying fly and continued walking. Pride stung, Brokk grabbed a spear and stood at the cave's entrance, trying his best to look fierce.

7. Because their single eye is directly above their nose, cyclopskin do not have "bridges" to their noses. Instead, a cyclopskin's nose is broad and flat, with wide nostrils. The oversized nostrils allow for a greater air intake in the higher altitudes, where many mountain-dwelling cyclopskin lair.

8. "Favored female" status is often not based upon physical attractiveness, but rather on storytelling ability. In cyclopskin society, the females are the keepers of the spoken history of the tribe (cyclopskin do not have a written language). They actually must keep track of two separate histories: the "official" history, in which all benefits are attributed to the current tribal leader (the strongest male), and the "real" history, which by necessity is spoken of only among the females. As might be expected, the "official" history changes each time a new male takes over leadership of the tribe. At that time, a new "favored female" may be chosen, based upon which female can present the new leader with the most impressively revised "official" history (starring himself, of course).

9. Cyclopskin mature quickly—another evolutionary adaptation to counter their often short life spans. A cyclopskin reaches adulthood by nine or ten and has an average life span of 35 to 40 years.

10. Cyclopskin occasionally breed with members of other humanoid species. Most unions do not result in offspring, with a few exceptions. Cyclopskin/orc crossbreeding results in larger, one-eyed orcs. As their single eye is reminiscent of the one-eyed orcs of Gruumish, these half-breed orcs often become tribal shamans or witch doctors.

Unions between cyclopskin and ettins result in an ettin-sized, two-headed creature with a single eye on

each head. (See the "biclops" entry by Spike Y. Jones in *DRAGON Magazine* #172.) Fortunately, humans and demihumans cannot breed with cyclopskin.

11. Unlike most other mammals, cyclopskin are immune to the rhizomes produced by gas spores ("gurokka" in the cyclopskin language) and can therefore touch them without harm. As a result, cyclopskin often keep gas spores as "pets" or "lucky guardians" in their caves. They like the fact that gas spores have a single large eye. (Cyclopskin ignore the smaller, eyelike organs on the ends of the rhizome growths.) In fact, cyclopskin are preternaturally disposed toward liking beholders and roppers for the same reason, but unfortunately they have no natural resistance to the attacks of these creatures. (Some beholders make use of cyclopskin minions; these beholders are generally believed to be gods by the cyclopskin tribes they dominate.)

Cyclopskin bands that domesticate sheep or goats, or those with mammalian slaves (such as humans and demihumans) must take precautions to keep them safe from their gurokka. This is usually done by tethering the gas spore in place or putting it in a cage. Being well aware of the gas spore's explosive power, cyclopskin occasionally use gas spores as last-ditch weapons in defense of their cave, throwing the creatures at invading dragons or wyverns looking for a quick cyclopskin meal.

12. Cyclopskin prefer simple weapons—clubs, spears, slings, and bardiches. The clubs can be either standard size or, more commonly, great clubs (see *The Complete Guide to Humanoids*, page 112, for details). The cyclopskin bardiche is a stone axe head mounted on a 5' wooden shaft. Cyclopskin have simple battle tactics: they see a foe and immediately

close to fight using clubs or bardiches. The spears and oversized slings (which inflict 1–6 hp damage) are used only if the enemy is out of range, and also for the rare occasions cyclopskin go out to hunt.

Occasionally, cyclopskin fill their slings with a handful of small rocks and pebbles. Such "buckshot" spreads over a larger area, negating the –2 penalty on missile attack rolls by dint of having a better chance of hitting their target with at least one of the stones. A natural 20 inflicts 2d6 + 4 hp damage as a result of the target being hit more than once. On the down side, it takes a full round to reload a sling with such "buckshot."

Because of their monocular vision and resultant lack of depth perception, cyclopskin strike at –2 to hit (but not to damage) with most missile weapons. For this reason, they put little stock in ownership of missile weapons; slings and spears are community property, to be used by any tribe member requiring them. Melee weapons, on the other hand, are more reliable, inflicting greater damage to the cyclopskin's enemies (owing in no small part to the brutes' enormous Strength, which adds +4 to all melee weapon damage)—thus, nobody had better mess with a cyclopskin's club or bardiche. These weapons are private property, and taking another's melee weapon is grounds for a fight, often to the death.

Cyclopskin are more than willing to make use of captured weapons, but as metalsmithing is unknown to them, they do not manufacture swords, daggers, or the like.

13. Kragh is an alcoholic beverage, much like the koumiss, or fermented mare's milk, enjoyed by the Mongols of the Asian steppes. Kragh is made from either goat's or sheep's milk.

As much as pretending to be a fearsome sentry assuaged the young cyclopskin's pride, it got boring rather quickly. Time passed; he amused himself by repeatedly throwing his spear at a tree, by gathering up pebbles and seeing how far he could throw them down the mountainside, by watching the females carve spearheads out of stone,¹⁴ and by picking berries from the bushes that grew near the cave. Once a squirrel came near; Brokk threw the spear but came nowhere close to hitting it. The animal scampered off to safety.

Out of ways to amuse himself, Brokk approached Gruba and asked for a story. Always eager to speak the tribe's history, Gruba gladly complied.

"I tell the tale of the wicked troll," intoned Gruba. The other females stopped their carving and paid attention, listening not only to the favored female's words but to her story-telling technique as well.

"This was back in the days of the beholder-god Jzemnix, before Gulokk tired of his demands upon us and slew him. There were many trolls in these mountains in those days, and they often preyed upon us as if we were sheep!" This last word brought a gasp among the listeners, Brokk included. Imagine, he thought, a creature able to bring down a powerful cyclopskin as easily as we slay a sheep! The mind staggered.

"In exchange for our worship, Jzemnix was a protector to our people. He kept the trolls and the dragons, the tigers and the wyverns at bay. Or ..." Gruba said, looking around at each member of her audience, "he was supposed to. But Jzemnix was a bad god! While he wandered the mountains in search of other gods, a fierce troll snuck up on our tribe. Great were its claws! Wicked were its teeth! Mighty was its hunger!

"The troll struck with a wild fury. Many warriors met its attack, but with every swipe of the monster's claws, another cyclopskin fell dead.

"Finally, Gulokk approached the troll. He hefted his lucky bardiche in his mighty hands, and the troll knew fear! Jzemnix knew fear too, for he knew that Gulokk would kill the troll and show us all that we did not need a useless god! So Jzemnix raced to the scene, and the troll ran away. But before it did, it snatched up a dead warrior in each of its wicked claws—and that night, the sounds of the creature feasting, tearing flesh and snapping bones, could be heard for many miles."

Her story finished, Gruba returned to the spearhead she was carving. Reluctantly, the other females followed suit. Brokk, bored again, looked for something else to do.

Fortunately, the sheep were being herded out of the cave to graze. Turogg, a male only a few years older than

Brokk, gave him the choice of watching the sheep or the slaves. Thinking it over, Brokk chose the slaves. Sheep were boring. So were slaves, for the most part, but at least the young cyclopskin could lord over the slaves—sheep were never properly intimidated. Turogg gathered up a spear and his lucky club and led the sheep higher up the mountain where the good grazing was to be found.

That left only Old Gork, the three females, and the slaves with Brokk. He gathered up the slave restraints—lengths of leather cord used to hobble them at the ankles to prevent them from fleeing—from a pile on the floor and beckoned them over. Woman, usually eager to comply with the cyclopskin's demands, cringed behind Man and Elf as they ambled over. She shivered as

14. While females are not permitted to use weapons, they are usually in charge of making them. The males are too lazy to do it themselves, and they don't wish to delegate the task to slaves.

(Disgruntled slaves and hand weapons are never a good mix.) The cyclopskin females become quite good at fashioning spearheads and axe heads, whittling down wooden shafts for spears and bardiches,

and sewing together leather slings. The males reserve club production for themselves, as this usually entails nothing more than finding a sturdy tree limb.

Brokk tied her ankles, fearful at the nearness of the brute. Brokk grinned smugly at her obvious fear.

Once the three slaves had been hobbled, Brokk gave them each a crudely made basket and sent them waddling down the mountainside with a prod of his spear. Old Gork looked up from the cave interior, grunted once, and returned to his rat-hunting among the bone-piles, ever searching for fresh meat.

The trip down the mountainside was boring, as expected. The slaves were listless, so firmly entrenched in their servitude it seemed pointless to have to guard them. Brokk almost wished they'd try to escape or something, so he could put a stop to it. That would impress the adults, singlehandedly quelling a slave revolt!

But no such luck. The closest thing Brokk got to a slave revolt was when he caught Elf grumbling aloud to the others. "Shuddup up there!" bellowed the cyclopskin,¹⁵ whacking Elf on the side of the head with his spear and causing him to fall to the ground. The other two slaves helped him back up and then resumed their trek in glowering silence.

It was midafternoon by the time Brokk's slaves (for that was how he thought of them, without others of his kind around) had filled the baskets with sufficient foodstuffs—mushrooms and tubers, mostly, with some wild berries and scraggly weeds thrown in as well.¹⁶ He was leading them back up the mountain and was finally within sight of the cave, disgusted with the pathetically slow progress of the maimed elf, when he heard shouts coming from above. It was Turogg's voice, roaring a battle challenge. There was also the bleating of frightened sheep.

Brokk was in a quandary. There was a battle up ahead—a chance to fight! And yet, if he left the slaves, they might escape. But a battle! Brokk twisted his head back and forth, looking first at his hobbled charges and then back up the mountain, at the sounds of combat.

What to do? What to do?

Finally, he came upon a solution. Grabbing Man's head in one hand and Elf's in the other, he smacked their heads together—clunk! Both slumped unconscious to the ground. Woman shrieked and went to Man's aid. "Stay there," warned Brokk, then grabbed his spear and raced up the mountainside, shouting for Gork.

Old Gork poked his head out of the cave to see what all the commotion was about. "The slaves," panted Brokk, pointing down the mountainside. "See to the slaves!" Then he was past the cave, racing to the pasture lands above. Old Gork grunted, grabbed up a spear, and limped down to find the slaves. He grumbled to himself as he walked.

Brokk, out of breath, followed the sounds of frightened sheep and popped up onto a flat stretch of ground. There he saw the green, hunched back of an enormous troll—just like from Gruba's story! The powerful creature had one arm raised above its misshapen head, and Turogg dangled in its grasp. The cyclopskin's feet kicked feebly in the air, his hands desperately trying to pull the troll's gnarled green hand away from his windpipe. Turogg's face was turning blue, his single eye bulging as if about to pop.¹⁷

The troll's back was to Brokk. Stopping only long enough to tighten his grip on the spear, Brokk charged the fearsome creature. The stone tip of the spear made a pleasant tearing sound as it ripped through the troll's back. Unfortunately, it plunged right through the vile creature's body and impaled Turogg through the belly as well.

The troll dropped Turogg and spun around to face this new threat. Of course, the weight of the falling cyclopskin, still pinned to the spear that pierced the troll's body, threw the troll off balance, and it landed awkwardly atop its one-eyed prey. Brokk, now weaponless, found his tribe-mate's lucky club lying in the grass a few feet

away. Turogg did not look like he'd be offering any complaints, so Brokk grabbed up the weapon and brought it down onto the troll's head. There was a satisfying thunk as he caved in the creature's skull, but that didn't stop the hideous troll's movement. Half of its head caved in, it still wriggled in an attempt to get free of the spear. Brokk brought the club down again, and again, and again, crushing the troll to a bloody pulp. Turogg's body didn't fare much better. Then again, he was already dead.

Thoroughly winded, Brokk sat down to catch his breath. The sheep had spread out in all directions, but now that the excitement was over, they settled down and returned to their grazing. Brokk thought about trying to gather them together but didn't have the energy.

Then, several minutes after Brokk had killed the troll, it started moving again, struggling to get up. Brokk picked up Turogg's club and bashed the creature until it stopped moving. He kept a wary eye on it, and sure enough, it started moving again a few minutes later. Brokk kept up the routine, killing the troll over and over again every few minutes, scaring the sheep, until finally, some time later, Gulokk and Brugar appeared.

"What the—?" sputtered Gulokk, amazed at the sight of the dead troll. He looked at Brokk with admiration clearly showing in his eye. "My son," he said. "My son, the warrior!"¹⁸ Brokk felt his chest swell with pride.

Gulokk quickly took control over the situation. He and Brugar pulled the spear out of the battered troll's body, dragged it off of Turogg's stiffening corpse, and stretched it out on the grass. With a mighty swing of his bardiche, Gulokk severed the troll's head and sent Brokk scampering after it. Brugar, meanwhile, did the same with the troll's hands. Then, gathering up the severed appendages, Gulokk pitched them off the side of the mountain in three different directions to prevent them from reat-

15. Cyclopskin speak the common language of giants among themselves, although some individuals may also learn to speak an additional language as well: usually the Common tongue or either the hill giant or ogre dialect.

16. While cyclopskin prefer a diet of meat—any

meat—they can live off of nearly any animal or plant diet. During the harsh mountain winters, cyclopskin have learned not to be particular about what they eat, so long as they eat.

17. A cyclopskin's eye tends to bug out somewhat anyway. The position of its eye grants the creature a

wide range of vision, nearly 180 degrees in front of it. Cyclopskin rarely have vision trouble (such as nearsightedness or farsightedness); this is probably an evolutionary adaptation: with only one eye, it's important that the cyclopskin retains strong vision.

taching to the rest of the troll's body, as they were wont to do.

Brokk helped drag the troll back to the cave. "Old Gork!" cried out Gulokk. "We have brought you fresh meat!" The females came forward at the call, but Gulokk sent them up the mountain to watch over the sheep. "This is a warrior's meal!" he cried out to them. "You will feast later, with the slaves! Gork, where are you? My fine son Brokk has killed a troll!" Gulokk searched the cave in all directions: Old Gork was not to be seen. "Where is he?" he asked.

"I sent him down to look after the slaves," ventured Brokk.

"Old Gork tending slaves?" roared Gulokk. He slapped Brokk on the side of his head. "Fool! Idiot!"

"But they were hobbled ..." began Brokk.

"Pah!" spat the leader. "Even hobbled, they can outdistance Old Gork! Come, quickly!" And he raced out of the cave, Brugar and Brokk on his heels.

It was too late. Gulokk and the others came upon Old Gork pushing Elf up the mountain with his spear. "Where are the other slaves?" demanded Gulokk.

Old Gork snorted in contempt and pointed down the mountain with his thumb. "They ran. You can go after them if you like, but I'm too old. Caught this one, though."

"I did not try to flee!" sputtered the elf. "The others ran when the young cyclops¹⁹ left us, but I didn't! I—I tried to stop them!"

Gulokk pointed down at the slave's feet. "Your bonds are gone," he pointed out, smacking Elf in the side of the head with his fist. The slave crumpled over. "Drag him back to the pen," said

Gulokk. Then, looking directly at Brokk, he said, "This is your fault! Find

those slaves at once! Brugar, go with the idiot!" The two cyclopskin rushed off. As he raced down the mountainside, Brokk realized he had fallen from the leader's prized son to the tribal idiot. Such were the ways of luck, he decided.²⁰

That night, Brokk and Brugar returned to the cave empty-handed. The two

18. Since most cyclopskin don't keep regular mates (breeding with whoever's available in the tribe), questions of paternity are seldom answered accurately. The tribal leader usually takes credit for being the father of particularly strong warriors, as obviously they could inherit such strength only from him. Of course, once the leader is killed and a new one takes his place, the new leader takes credit for being the "true" father of the powerful young males of the tribe. Cyclopskin are thus generally never aware of their true fathers.

19. Many people don't differentiate between true Cyclopes and their smaller cousins. Whereas the cyclopskin stand only 7' tall, a cyclops is normally about 20' tall, able to hurl boulders at a range of 150' like true giants (causing 4-10 hp damage, not 410 as incorrectly printed in the *MONSTROUS MANUAL*, book, page 133). The name "Cyclops" means "wheel-eyed," named because their eyes are said to be as big and round as wagon wheels.

20. Most cyclopskin do not bother worshipping gods. The main exception to this rule is when a band of cyclopskin serves as a beholder's minions—then, they revere the beholder as their all-powerful god. After all, a beholder as a god makes perfect sense to them: the creature is very powerful, has one big eye in the center of its head (like them), and can actually be seen (and thus no effort is required to believe in the beholder's existence—this doesn't hold true for other, less visible gods).

Instead of a god, cyclopskin fervently believe in luck as a powerful force of nature that affects every aspect of their lives. If they have a successful hunt, luck was with them that day. If their favorite weapon is dropped down a crevice and lost, it is an unlucky day. A cyclopskin's change in fortune is blamed on others whenever possible; a cyclopskin "scapegoat" is chosen as the cause for the individual's misfortune, and a fight usually ensues. If the scapegoat loses, it is believed by the winner that his

luck will now change for the better. If the scapegoat wins, then he has proven that he wasn't responsible for the bad luck, and the challenger must find another cyclopskin to blame for his misfortune. Such luck-fights are limited to the males, since how could a lowly female have any effect on a male's luck?

Since most cyclopskin bands do not worship gods, they do not have a shaman or witch doctor among them. In fact, magic is seen as a powerful and unnatural force to be feared and destroyed whenever possible. A band of cyclopskin attacking a party of adventurers always targets wizards and priests first—warriors they understand, but you never know when some robed human will start throwing fireballs at you simply by pointing a little stick in your direction. Magical items known as such are usually discarded by cyclopskin in an attempt to ward off their "unlucky" properties. On the other hand, cyclopskin often wield magical swords or other weapons, simply because of their ignorance of

slaves were gone, vanished without a trace.²¹ Brokk slumped into the cave, ready for a night of abuse from the tribal leader.

Surprisingly, Gulokk's mood had mellowed during their absence—no doubt a result of the abundant feast of troll-meat. As Brokk tore a piece off of the green-fleshed troll corpse, he was amazed as the missing piece started growing back.

"Great, huh?" asked Old Gork as he settled down beside Brokk. "You did good, boy."

"But the slaves ..." began Brokk, tears starting to well unbidden in the corners of his eye.²² He blinked them back, not wishing to appear foolish, even before Old Gork.

"Pah!" spat the elder cyclopskin.

their magical properties. If the *long sword* +2 he took from a slain adventurer allows a cyclopskin to hit his enemies in combat more often than usual, surely that's because of the cyclopskin's skill, or because the weapon is "lucky," not because of any inherent magical power in the sword.

21. Cyclopskin are universally recognized as pathetic hunters and even worse trackers. Evading a

"Who needs 'em? Now that we got a troll for food, there's less work for a slave to do! We don't need them to gather as much food when we got all the meat we'll ever need right here!" Old Gork cackled in delight. "Besides, we still got us a slave, all right. He'll do plenty for now. And maybe, if we're lucky, someday we'll get more!"

Later that night, back in his bed of mismatched hides, Brokk thought back on the day's events. He had killed a troll. That was lucky. He had also killed Turogg and allowed two slaves to escape. That was unlucky. He had gained Turogg's lucky club, though; that was lucky. He had become an adult in the eyes of the tribe, too: definitely

cyclopskin in the wild is not difficult at all. On the other hand, tracking one is almost embarrassingly easy, as they make no attempts to hide their trails or cover their tracks merely plod along in their bumbling way. Even those without the tracking proficiency can follow a cyclopskin's trail one time out of three; those with the tracking ability gain a +4 bonus to their attempts when following cyclopskin. As a

lucky. Still, he'd miss Woman, even though she was so ugly. Unlucky. But then, he did have a belly full of troll flesh, and was more comfortably full than he had been in a long time.

Oh well, thought Brokk. All in all, a lucky day. He rolled over, scratched at a few pestering fleas, and was soon asleep.

Johnathan M. Richards has amassed quite a collection of lead figures. He refuses to paint them on the grounds that, unpainted, they're fine statuary. Painted, they're toys.

noted ranger once put it, when it comes to a cyclopskin's knowledge of tracking skills, the word that best describes them is "clueless."

22. Cyclopskin have two tear ducts, one at each side of their single eye. Since they have just the one eye, evolution has made it easier for them to keep it free of grit and dust.

Advanced Dungeons & Dragons®

Fifty realms will wage war across a million square miles of unexplored territory. Join them.

The Ultimate Play-By-Mail Campaign!

Incredible laser graphics. Get detailed maps with each bi-weekly campaign report.

Amazing detail! Face drow and deva, liches and lamia, goblins and gods. Over 600 mapped sites!

Simple to learn. Fun to play. Can you conquer the Savage North? An entire realm is yours to command!

The Ecology of the

Dakon

by Nick Parenti

Remember the dakon? An old race made new for the AD&D[®] game

Many of the creatures cataloged in the AD&D[®] 1st Edition game's tomes are no longer utilized, their gaming potential now unnoticed. This is disappointing, since many of them diverge from the basic Tolkien-style races and monsters in both appearance and characteristics.

The following expanded description of the FIEND FOLIO[®] tome's dakon (a monster not found in the FIEND FOLIO appendix to the AD&D 2nd Edition Monstrous Compendium) is provided as an example of what can be accomplished with limited resources (its original description was only two paragraphs long). By choosing new behavioral, cultural, and regional themes, I constructed a more colorful and useful creature.

A brief synopsis of the creature's statistics follows, fleshed out for both editions of the AD&D game, with the two paragraphs that originally described it (edited slightly):

Dakon (1st Edition): FRQ uncommon; #APP 6-60; AC 5; MV 6"; HD 1 + 1; %LAIR 50%; TT E; #AT 2; Dmg 1-10/1-10; SA nil; SD nil; MR standard; INT average; SZ M; PSI nil; LVL/XP I/20 +2 per hp.

Dakon (2nd Edition): C/T Tropical/jungle; FRQ uncommon; ORG tribal; AC-TIVE day; DIET omnivore; INT average; TREAS E (community); AL LN; #APP 6-60 (village); AC 5; MV 6; HD 1 + 1; THAC0 19; #AT 2; Dmg 1-10/1-10; SA missile; SD nil; MR nil; SZ M; ML 11-12; XP 35 (more for multilevel warriors and spellcasters).

A shabby, intelligent ape with a reasonable grasp of the common tongue, a dakon never attacks except in self-defense or to recover treasure stolen from it. When it attacks, it does so with a +2 bonus to hit because of its strength and the sharpness of its claws, using each clawed hand to inflict 1-10 hit points of damage.

The dakon is usually a light brown color with green eyes and black hands. It is found in all locations except near large expanses of water. It is normally on good terms with lawful humans and demi-humans, though it has learned to distrust the motives of humanoids and so will not communicate with them.

The revised dakon

In the jungles of tropical continents live the gorilla-like dakons, who are seldom seen elsewhere. These advanced primates are powerful and proud, and they guard their culture with the same fierceness with which they guard their young.

Highly social beings, dakons can be found living in villages, towns, and even cities. They build their homes in the largest of trees but are equally able to construct their thatched houses on stilts. Climbing is no problem, as all dakon can climb trees and rough surfaces in calm, unhurried circumstances; even in tense, combative situations, they have a 99% chance to avoid falling. Unaccustomed to using stone for building, their communities are surrounded with wooden palisades for protection.

A dakon village has under 100 residents. Towns have populations ranging from 100 to 500, and cities rarely are home to more

than 1,000. Children and young adults make up 40% of any community; adult females constitute 35%, and the remaining 25% are adult males. Mated couples never have more than two children at one time and usually remain together for life. Dakons have character classes among their more powerful members; of the males, one in 10 is a warrior of level 1-6 (1st-level warriors start with maximum hit points).

Each dakon community has a dominant male leader called the *ghana*, or war chief. His duties include leading the adult males of his group in the defense of their community and carrying out the policies and commands of the region's *kaya maghan* ("king of the gold"). A ghana may choose his mate and gets first pick of any communal property, including food. The most powerful ghanas compete to become the *kaya maghan* when the latter position is vacant because of forced retirement or death. The ghana is always the highest-

level warrior in the community.

Competitions for the title of ghana are held in each community about every five years, or sooner as the result of an existing ghana's death, cowardice, or failure to carry out his duties. The competition, open only to males, includes a ritual show of strength and fierceness through a visual display that always includes bared teeth, war cries, chest-pounding, and excessive arm-flailing. In the end, the most impressive and persistent competitor is left standing as his former peers skulk nearby, submissively avoiding eye contact with their new leader. Occasionally, two individuals prove worthy; in this event, the community splits. The senior ghana remains in the old community while the junior ghana leads his followers to settle a new community. In the past, such incidents in the competition for *kaya maghan* have led to brief periods of civil war.

The *kaya maghan* is named so because his office gives him ownership of all gold mines worked by his people. He keeps whatever amount of gold he wishes and distributes the rest as gifts to his most loyal retainers, ghanas, and warriors. The dakon love gold and spare no expense in adorning themselves in gold jewelry. The mines are run by local ghana and worked by dakon criminals and slaves. Slaves are taken from the many other races found in the jungles near the dakon, such as gnolls, banderlog, kobolds, humans, elves, orcs, and tasloi.

Although dakons tend to dominate and look down upon the banderlog (the baboonlike folk from the 1st Edition *Monster Manual II*), the banderlog view the dakon as kin and have been known to fight alongside them against the brutal, evil, and often mad yuan-ti, qullan, tasloi, and gnolls. Part of this may be due to the dakons' possession of a form of beast-mastery over other primates; they are known to keep monkeys, gibbons, chimps, and gorillas as pets and guard animals. Although harder to train, carnivorous apes are also maintained in much the same way that other races keep war dogs. In fact, any nonhuman primates may be

Table 1
Dakon Ability Scores

Ability	Min. *	Max. *
Strength	15 (12)	18/00 (18)
Intelligence	3	13
Wisdom	3	18
Dexterity	8	18
Constitution	12	18
Charisma	3	18**

* Scores in parentheses are for female dakon.

** This applies to dakons only; the maximum charisma score to a non-dakon is 12.

subject to a dakon's innate *animal friendship* ability, which functions like the cleric spell but without the use of a holy symbol. A dakon need only approach a primate with an intelligence of at least 1 (animal) and at most 7 (low), then spend one hour speaking to and physically touching the prospective follower. The primate has a 1% chance per hit point it possesses of resisting the dakon's wishes; only full, unwounded hit-point totals are considered here. If the primate resists the dakon's influence, it will leave peacefully. Otherwise, it follows the dakon and becomes its petlike associate, able to learn whatever tricks it can be taught. Dakon care well for their primate followers but, because of the problems in caring and feeding for them, usually avoid having many "helpers."

Dakon prefer the company of their own kind. They have good relations with other intelligent apes, such as the grommams from MC7, the first SPELLJAMMER® appendix to the *Monstrous Compendium*. They tolerate the presence of banderlog and other primateline or monkeylike beings, such as the hadozee from MC7. Humans, demihumans, and needlemen are regarded neutrally; humanoids and giants are greeted with antipathy (and threats of attack); gullan, tasloi, and yuan-ti are hated and attacked on sight.

Dakon are almost exclusively traders and hunter/gatherers. They practice agriculture on a small scale by cultivating plots for individual needs. The males hunt on foot or elephant-back using spears, javelins, blow guns, or clubs, gaining bonuses in melee for their 18/91 strengths (+2 to hit, +5 to damage; all other lifting and door-opening abilities apply). These weapons are the same ones they use in war; they use their sharp claws only when they have no other weapons handy. (Dakons have never learned wrestling.) One or two carnivorous apes are often used to track, flush, and retrieve game. Females and children are organized into foraging parties with armed male escorts. The escorts check and maintain the community's traps while the foragers comb the jungle in search of food and natural medicines.

All the food gathered, as with most other property except for gold, is community owned. The local ghana chooses what is his; the rest is divided equally among the populace. Occasionally an individual's bravery in battle or prowess in hunting earns him extra rewards, usually in the form of gold jewelry. Bracers, arm bands, anklets, and head pieces predominate

among males, while females prefer necklaces, nose rings, and earrings.

Possessing little skill as blacksmiths, their weapons and tools are made of wood, stone, ivory, and bone. A dakon war club is known as a *knobkerrie* and may be elaborately shaped and carved. Wooden shields covered with colorfully painted leather are common, as are helmets made from the skulls of past opponents (AC 3 to head at best). Dakons do not use armor, as they consider it cowardly. They sometimes ride trained elephants into battle; each elephant is ridden by a mahout armed with a club and a warrior armed with one or more missile weapons (including rocks). During wartime, a logical ghana leads most of the adult males of his community into battle. A few adult males are left behind with the old and adolescent to defend their homes. Females are expected to protect and care for the children and are ferocious if threatened. Females always attempt escape with their young before resorting to violence.

Drum towers in each dakon community are used to pass news, report disasters, coordinate relief, and make public announcements from ghana of the kaya maghan. During battles, the signal drums of the dakon can be heard directing the action and making reports. Dakons also imitate animal noises, howling to communicate over long distances. All dakon know at least a few drum signals and howl-calls. Aside from speaking their own language (which is based in large part on hoots, grunts, finger and hand gestures, and body postures), most dakons are capable of limited communication with apes and know other racial languages common in their area. Most dakon are at least able to understand the common tongue if the conversation is kept simple, but very few are fluent in it.

Dakon religion is based on the existence of a spirit world where fiends and their ancestors' spirits live. The spirits, which are lawful neutral and equal at most to demigods, influence the material world through magic and possession. Dakon shamans are known as *sakirs* and perform community service with the powers they receive from their ancestors. Each community has a 25% chance of having a sakir of level 2-7, who will have 1-3 initiates living with him and his family. Before an initiate can acquire the title and power of a sakir, he must survive a year as a hermit with no shelter but the jungle's trees. His task is to commune with the spirit world.

If he survives, he gains the knowledge to pen spells, which may be written on parchmentlike tree bark with berry inks. Scrolls may be manufactured only by 7th-level sakirs; they cannot make potions or other magical items.

Occasionally during these hermitages, initiates discover that tempting powers can be learned from fiends. Those who seek this arcane knowledge become zaras (witch doctors). Zaras remain hermits, and most maintain their alignments, though with great difficulty. A few zaras who seek power too quickly or in too great a quantity often become the servants of their demonic teachers. Eventually, their alignments change to chaotic evil; in extreme cases, they become possessed. Zaras may make scrolls at their highest level, too.

Dakons are active traders. Dakon merchants travel, often on elephants, in large, armed caravans. Merchandise is carried by the elephants or on the heads of caravan members. Trained gorillas and carnivorous apes are employed as guards and assist in foraging for food. These caravans bring the fruits of the dakons' mines (gold, silver, gems, and diamonds), as well as exporting ivory and slaves to other communities in exchange for metallic mining tools, finished jewelry, fabrics, rugs, and any other richly colorful items considered exotic by the dakons.

Dakon justice is quick and harsh. Although there is no death penalty, a ghana or sakir who tries a suspected criminal has several options as he is both judge and jury. Punishments include banishment, slavery, public service, mine labor, and corporal punishments. All punishments are accompanied by the permanent removal of a hand-wide strip of fur down the individual's back, the mark of a criminal. Due to the great shame this causes, crime is rare among dakons. Marked criminals often flee, sometimes becoming bandits to raid and steal for a living. Crimes in dakon society include theft, murder, adultery, cowardice in battle, destruction of community property, and failure to obey the kaya maghan. Local ghanas add to this list, often including the failure to obey the ghana or a sakir.

Dakons are offered for use as intriguing nonplayer characters for game campaigns in tropical areas. The tables with this article offer information on converting them into an NPC race with character classes; their use as player characters is left up to the players and DM™.

Table 2 Dakon Class Statistics						
Class	HD	Max. level	Weapons	Armor?	Shield?	Poison?
Warrior (fighter)	d10	10	spear, javelin, blow gun, dagger, knobkerrie (club)	helmet only	Yes	no
Sakir (priest)	d8	7	blow gun, knobkerrie (club)	helmet only	Yes	Yes
Zara (priest/wizard)	d8/d4	7/4	as per sakir	no	no	Yes

THE ECOLOGY OF THE DARK NAGA

Fool Me Twice

Never send
a wizard to do
a rat's job.

THIS FIELD SESSION OF THE MONSTER HUNTERS Association is hereby opened," whispered Dreelix. To everyone's amusement, he pantomimed banging three times with an imaginary gavel in the air in front of him as he said it.

"You all know why we're here," Dreelix continued in a low whisper, casting a quick glance over his shoulder at the narrow, dark hole in the side of the hill. "Does everyone know what they're to do?"

"I can hear you out there, you know," called a voice from the hole.

Dreelix ignored him. "Buntleby, are you ready with that cloudkill spell?" he whispered.

"Certainly," replied Buntleby in a normal tone of voice. "But you realize that it'll probably have no effect on the creature."

"Shhh! Keep your voice down!"

"Why? It can obviously hear us."

"I can hear you just fine!" confirmed the naga from the hole. "But please, do carry on. Just ignore me. Pretend I'm not here—oh! But that would defeat the purpose, wouldn't it?"

"Go on, then," urged Dreelix.

Buntleby approached the naga's hole and hesitated. "I feel funny doing this, knowing that he knows what I'm doing," he said.

"Don't mind me," chirped the naga's voice. "It's OK—I don't mind being chased into a deep, dark hole by a bunch of crazed humans with some hair-brained scheme of cutting me up and turning me into a bunch of magical paraphernalia²—really, I don't mind at all."

"Sarcastic little begger," muttered Zantoulios.

"Still, I feel like a creep," said Buntleby.

"Go ahead," said Willowquisp. "I don't think it's going to work, anyway. As far as I know, dark nagas are immune to all

1. While a dark naga has no external ears, it does have a limited sense of hearing. Its snakelike body conducts ground vibrations to the inner ear via the bones of its skull, so a dark naga can "hear" footfalls approaching it, but air-transmitted sounds (like voices) are much more difficult for a dark naga to pick up.

To compensate, dark nagas have an inherent, continuous ESP ability that allows them to pick up the surface thoughts of anyone within 80 feet. This ability allows them to "hear" spoken words mentally (since the words are in the speaker's mind as he says them), although it doesn't allow them to "hear" a finger-snap, belch, hiccup, or other nonverbal sounds not transmitted through the ground. A dark naga can "hear" everything being spoken aloud within the 80' range of its ESP power, although it can

only concentrate on one voice at a time if more than one person is talking.

Oddly enough, the dark naga's ESP power makes it immune to attempts at mind-reading. This includes spells, magical items, and psionics.

2. The cranial portions of dark naga skulls are often used to craft medallions of ESP or amulets of proof against detection and location. The rubbery, bag-like organs in their gullets (see note 18) are sometimes used in the manufacture of bags of holding. Dark naga blood is one of several possible types of blood used to empower a periapt of proof against poison and is also employed in the creation of potions of ESP and oil of acid resistance. Finally, the dark naga's hide itself is sought for its unusual color, and the poison sac near the creature's tail spike can be siphoned to harvest a single dose of sleep venom.

poisons; I don't see why your cloudkill spell should be any different."³

"OK, then, stand back everyone," Buntleby warned. As he intoned the arcane words and performed the intricate finger-gestures necessary to trigger the spell, a cloud of ghastly green vapors began to form like fog from the ground. At a gesture from the young wizard, the noxious cloud billowed into the naga's hole and sank below the earth.

"Say, this isn't so bad," came the naga's voice. "In fact, I wouldn't—Gack! Aagh! IT BURNS! GODS, HOW IT BURNS!"

Buntleby, horrorstruck, put his hands to his face at the sounds of the naga's pitiable cries. "What have I done?" he cried, as the naga's torturous screams became more and more pain-ridden. "I didn't mean for him to suffer like this!"

"MAKE IT STOP! MAKE IT STOP!" screamed the naga. Buntleby staggered back in horror; Willowquisp grabbed him by the shoulders and led him back from the creature's hole. Ozzie, Buntleby's faithful osquip familiar, trotted to his master's feet and licked his ankles in sympathy with a raspy tongue. "There, there," comforted the elderly sage. "I'm surprised that it worked, but this should all be over with soon."

"THE PAIN! OH, THE UNHOLY PAIN!" The Monster Hunters all looked at each other guiltily. Grindle the Coin-Counter, all three hundred pounds of him, looked about to burst into tears. Lady Ablasta held a perfumed handkerchief to her face and looked away. Even Dreelix, who cared only for the money to be made from the magical items fashioned by the strange creatures his association hunted down and slew, looked a little green. And still the naga's tortured cries emanated from the hole.

"THE INHUMANITY! TO BE SLAIN IN SUCH A CRUEL FASHION! ALL FOR GREED—FOR THE

"I can hear you out there, you know," called a voice from the hole.

SIMPLE LOVE OF MONEY! OH, WOE IS ME! THE PAIN—THE UNENDURABLE PAIN! NEVER HAVE I KNOWN SUCH AGONY! NEVER HAVE I SUFFERED SO! MY SCALES BURN LIKE HOT COALS! MY THROAT BLISTERS AND CHARS FROM WITHIN!"

"Hey, wait a minute," said Zantoul-lios, scowling.

"THESE POISONOUS FUMES! EACH GASP OF BREATH IS UNBEARABLE PAIN! EACH BEAT OF MY HEART SENDS THE POISON DEEPER AND DEEPER INTO MY PAIN-WRACKED BODY! OH, THE HORROR! THE HORROR!"

"He's sure got plenty of breath for somebody choking to death," observed the gangly wizard, hands on his hips. "What do you think, Dreelix?"

Dreelix wiped surreptitiously at a tear in his eye, then scowled back at Zantoul-lios. "He's faking!" he agreed.

"THE TERRIBLE, GUT-WRENCHING TORMENT! THE DREADFUL, MIND-NUMBING HORROR! THE AGONIZING, PANIC-INDUCING—"

"Oh, shut up down there!" Dreelix yelled. "We're on to your tricks!"

"Righty-ho," agreed the naga in a cheery voice. "What's next then?"

"Okay, so that didn't work," said Dreelix. "Let's move on to Plan B: Grindle, do you have the hook and bait?"

Grindle shrugged off his pack and removed a sturdy rope, to the end of which was attached a metal grappling hook. Rummaging through the pack, Grindle pulled out a roast chicken and stuck it onto the hook, careful all the while to keep the side where he had already taken a few nibbles hidden from view. "Okay," he said finally.

"This isn't going to work," lamented Willowquisp, shaking his head sadly. "This is an even dumber idea than the poison cloud."

"You were the one who said it was a carnivore,"⁵ hissed Dreelix. "Plus, you said it had to swallow its food whole.⁶ This'll work. Just give it a chance. Go ahead, Grindle."

Grindle walked up to the hole and paid out the rope, sending the roast

3. Dark nagas are immune not only to all normal and magical venoms and poisons, but also to all acids. In fact, many dark nagas habitually drink a vial of poison and then spit it out at opponents later in battle. Such poison-spitting attacks have a range of 10 feet; optionally, the naga can hold the poison in its mouth and add the poison effects to its normal bite damage of 1d4 hp. While far less common, a dark naga can also spit acid in a similar fashion.

4. Actually, like most snakes, nagas are able to go without breathing for some time. The standard sequence is: breathe out, breathe in, pause without breathing for awhile. The pause without breath is called *apnea*, and its duration depends upon the naga's activity. A resting and undisturbed naga can go without breathing for several minutes; during

hibernation, the naga can actually go without breathing for several months at a time. (Cutaneous respiration—the exchange of gas through the creature's skin—provides the naga with enough oxygen and also disperses the buildup of carbon dioxide during these motionless periods.)

5. Given a choice, a dark naga would live a strictly carnivorous diet—they are especially fond of hot, fresh blood. However, being practical, they supplement their diet when necessary with lichen and the occasional green plant when prey is scarce.

6. The dark naga must swallow its prey whole, since it lacks the teeth necessary for chewing. (Its fangs are used only to stab prey and hold it in the naga's mouth.) Even though the dark naga has a human-like head, its lower jaw is hinged like that of

a snake, allowing the creature to swallow prey larger around than itself. For the same reason, its ribs are flexible, and its scales can stretch to accommodate swallowed prey. An adult dark naga can swallow a victim of up to size M, although the prey must already be dead (or at least paralyzed with sleep venom) before the naga attempts to devour it—the creature cannot swallow prey in combat.

The easiest creature for a naga to swallow is a snake or snakelike creature: Being narrow in build and limbless, such creatures slide effortlessly into a naga's gullet. A dark naga will not eat another dark naga, but all other creatures, dead or alive (including other types of nagas) are fair game. The dark naga's immunity to venom makes even poisonous snakes easy prey.

chicken plummeting down to the naga. "Oh no!" he cried out in mock anguish.

"What's wrong, Grindle?" asked Dreelex on cue, bending close to the hole to make sure the naga would be able to hear him.

"My chicken! I dropped it, and it fell down the naga's hole! That was going to be my lunch!"

"This is embarrassing," muttered Buntleby to Willowquisp. The sage

hand, the flab under his arms jiggling with each movement. Zantoulios gripped the end of his staff tightly, ready to bonk the naga over the head as soon as it appeared.

Sure enough, a human-sized head and snake-like body popped up out of the hole, attached to the end of Grindle's line. However, while the Monster Hunters expected the creature to be covered in dark scales,⁷ this one was white—

its open mouth, striking the gangly wizard and bowling him over backward with a howl of surprise and pain.

Buntleby pushed Willowquisp back out of the way, knowing that the elderly sage was of little use and in considerable danger in a battle. Grindle, meanwhile, dropped his rope and rushed to close with the creature. It got in a couple of jabs with its tail spike, but the heavyset wizard managed to crush the bone naga's skull between his powerful hands, and the thing fell to the ground in pieces, each bone falling apart from the others. Winded, Grindle wiped his forehead with the back of one hand, shuffled over to the end of the rope, and retrieved his roast chicken. Brushing the dirt from it, he helped himself to a massive bite.

"Hey, bone nagas don't come cheap!" whined the dark naga petulantly from its hole. "I spent a lot of time on that one!"⁹

"Good work," said Dreelex, clapping Grindle on the shoulder.

Buntleby helped Zantoulios to his feet. "I'm fine, I'm fine," grumbled the gangly wizard, brushing off the dirt from his robes.

"Now what?" asked Willowquisp.

"We've got to get him out of there, out into the open," said Dreelex, fuming. "If we could just get within visual range of

Twin magic missiles shot out of its eyes and one bolted from its open mouth, striking the gangly wizard and bowling him over backward.

shook his head in agreement.

"Hey, what's this?" came the naga's voice from the hole. "Why, it looks like free food! Thanks up there!" There was a short pause, then the creature called up, "Hey, this is pretty good!"

"He fell for it!" cried Dreelex, wringing his hands together in anticipation. "Quick, pull him up!"

"He can't have fallen for it," reasoned Buntleby. "How could he talk to us if he had a roast chicken in his mouth?"

"No, I've got him—I can feel it!" cried Grindle, pulling the rope up hand over

bone white. As more of the creature was pulled out into the open, the reason for this became apparent: it wasn't a dark naga after all, but merely an animated skeleton.⁸

While the Monster Hunters stood motionless in shock, the creature opened its jaws wide and spit out the chicken impaled on Grindle's grappling hook. As if on cue, Zantoulios brought his staff crashing down upon the bone naga's skull, but it merely shrugged off the blow and attacked. Twin magic missiles shot out of its eyes and one bolted from

7. Coloration varies among dark nagas: Most are either black or a deep, purplish-black, although there are a few whose scales are a very dark blue. A dark naga's scales are so small as to be almost invisible to the naked eye, giving the creature a smooth, eel-like appearance (which is further enhanced by a crest along the top of the naga's head and back; this crest is the same color as the naga's scales). Regardless of scale color, the dark naga's eyes are yellow and glow eerily in low light.

8. The bone naga is an odd form of undead, created from the bones of a dark naga. Created by dark nagas (and some evil mages) as guardians, these fell creatures serve their masters with absolute loyalty, communicating with them silently through a limited form of telepathy (60' range).

The similarities between bone nagas and dark nagas are many: both attack twice each round, inflicting 1d4 points of damage with their fangs and 2d4 points of damage with their barbed tail spike. However, the bone naga's bite also temporarily drains 1 point of Strength. In addition, while a dark naga's tail spike requires victims to make a successful saving throw vs. poison or suffer an additional 1-2 points of damage and fall into a drugged sleep for 2d4 rounds, the bone naga's tail spike instead automatically (no saving throw) causes 1d4 points of chilling damage (bringing its tail spike damage total to 3d4).

Both creatures cast spells as a 6th-level wizard (4/2/2), although a bone naga's spells are fixed when first created, cast by silent force of will (no verbal, somatic, or material components required), and return unbidden to the bone naga's mind 20 hours after use. Typical spells include *magic missile*, *blindness*, *flaming sphere*, and *lightning bolt*.

Bone nagas share the dark naga's immunity to all acids and poisons, plus have the standard undead immunities to *charm*, *hold*, *sleep*, death magic, and cold-based attacks. Further details on the bone naga are available in the *MONSTROUS COMPENDIUM® Annual Volume One*.

Because of their similar appearance (basically a human skull on a snake's skeleton) it is easy to mistake a bone naga for a necrophidius, or death worm (see the *MONSTROUS MANUAL*, page 170). Closer examination shows the necrophidius lacks the bone naga's tail spike and has a solid lower jaw (unlike the bone naga, which shares the dark naga's two-piece, detachable lower jaw). It should be noted that a naga drinking a *skeletal potion* could easily pass itself for either creature.

9. The process of creating a bone naga is long and exacting. At its heart is a specialized magical ritual known only to dark nagas and a few evil wizards.

The ritual requires the full skeleton of a dark naga personally known by the spellcaster (dark nagas often animate their slain comrades as bone nagas; this practice often creates distrust among dark nagas living and working together, as each one must worry about which of its "friends" is really harboring ulterior plans). The dead naga's body is arranged in a circle with the tip of its tail spike inside its own mouth, and the living naga crawls inside the circle thus formed. The living naga must chant a litany of arcane words over the dead one as its flesh decomposes naturally; this process can take many weeks, during which time the naga must not leave the circle formed by rotting naga's body. Once the skeleton has been stripped clean of all flesh, the rest of the ritual is completed, during which time the bone naga's spell arsenal is chosen and implanted. (Obviously,

the spells must be known by the dark naga performing the ritual.) Finally, the bone naga is brought to unholy life by a temporary (and voluntary) draining of one-half of the dark naga's hit points; the dark naga can only heal this damage over time, at the rate of 1 hit point per day of rest. Because of the toll the animation of a bone naga places on the dark naga, bone nagas remain a rare commodity.

10. Not necessarily. A dark naga receives a +2 bonus to saving throws vs. *charm*, *sleep*, *hold*, and similar Enchantment/Charm spells. This bonus is due in part to the creature's exceptional Intelligence rating (16 is standard for the race).

11. Dark nagas give live birth to a squirming mass of 11-20 (1d10+10) young, which are immediately abandoned and left to survive on their own. While sharing the standard dark naga coloration, they otherwise appear to be foot-long worms—their human-like heads and barbed tail spikes don't develop until after their first molt. In the meantime, the immature nagas subsist on a diet of lichens, fungus, and molds.

After shedding their skin for the first time (a process known as *ecdysis*), the dark nagas develop their innate ESP powers and learn the languages of intelligent creatures around them. They continue to molt on an irregular basis (based upon their food intake—the more they eat, the larger they grow, until eventually they get "too big for their skin"), adding 6 inches or so with each molt until they reach their full size. The largest dark naga ever recorded was a full 12 feet long.

Because of their low metabolism, nagas can survive without food for extended periods of time. Therefore, when encountered in any numbers, the largest naga isn't necessarily the oldest, merely the most well fed.

the thing, one simple charm monster spell, and we'd be home free!"¹⁰

"Why don't you just come down here and get me?" taunted the naga from its hole. "Well, some of you, anyway—Grindle's obviously way too fat!" Grindle looked up from his chicken, shrugged, and returned to his meal.

"How about you, then, Willowquisp? Care to crawl down here? You could learn all sorts of fascinating things about dark naga development¹¹—you'd like that, wouldn't you? Just think of the knowledge you could add to that notebook of yours. No? Then how about you, Zantoullios? You're thin enough to squeeze down my bolt-hole.¹² No? Well, how about you then, Ablasta? You should be able to fit that scrawny chicken-body of yours down here. Come on, my dear. Apparently none of the others are man enough!"

"Well, I never!" huffed the conjurer Ablasta, eyes blazing and nostrils flared.

"That might not be such a bad idea," whispered Dreelix.

"What do you mean—crawl down there with him?" asked Buntleby. "That doesn't seem wise."

"We could lure him, catch him off his guard."

"How?"

"Well, you and Grindle both know polymorph self, right? One of you polymorphs into a female dark naga, and, you know, makes nice."

"Great plan!" called the naga from the pit.

"Absolutely not!" cried Buntleby.

"It wouldn't work anyway," said Willowquisp. "There are no female dark nagas. No male ones either, for that matter."¹³

"Then how do they...?" asked Dreelix.

Dark nagas prefer to lair in rocky places like caverns and ruins with multiple exits.

"Quit messing around up there, and send me a partner!" called the naga.

"SHUT UP!" cried Buntleby and Dreelix in unison. The naga just chuckled.

Willowquisp pursed his lips in thought and walked away from the others, motioning for the others to follow him.

"Had enough?" called the naga. "Giving up so soon?" The Monster Hunters ignored it and kept walking.

"What's up?" asked Zantoullios, after they had formed into a huddle a good hundred feet away from the naga's hole.

"Did you notice how it calls us by

name?" asked the sage.

"So what?" asked Dreelix, irritably.

"The thing's got good ears."

"That's what I thought at first, too, but I don't think we've said Lady Ablasta's name aloud since we came here."

"Your point?"

"I think the thing's been reading our minds."

"What? Why didn't you mention this at the beginning?" demanded Dreelix.

"For a simple reason: I didn't know."

"How is it that you know all about their sexual makeup but know nothing about their mental abilities?"

12. Dark nagas prefer to lair in rocky places like caverns and ruins with multiple exits. At least one exit will be narrow enough for the naga to block with its body to fight off intruders. However, they don't like their tunnels to be too narrow, for the creatures are unable to crawl backward. They crawl through narrow tunnels using *rectilinear creeping* (pulling themselves forward by the edges of their belly scales); thus, to move backward in a tunnel, they must turn the front half of their body around and move head-first in the opposite direction.

Dark nagas are fond of traps, and their lairs often have numerous traps ready to be sprung upon the unwary. These traps are most often designed by the nagas but built by other races (orcs, hobgoblins, etc.)

in exchange for services from the naga (usually casting spells).

13. Dark nagas are hermaphroditic, having both male and female reproductive organs. When mating, both nagas end up pregnant, giving birth 5–6 months after mating. Dark nagas usually mate once a year, in the late fall, giving birth in the springtime.

14. Several spells and magical items are of great use when combating a dark naga. For obvious reasons, the *mind blank* spell, an *amulet of proof against detection and location*, a *ring of mind shielding*, or similar magic is indispensable, preventing the dark naga from being able to read the user's mind. Since the naga's ESP is its most powerful sense, depriving its use greatly hampers the naga's ability to target ene-

mies. (The naga has only short-range visual acuity.) Regardless of level, a mentally unshielded thief has virtually no chance of sneaking up on a dark naga; remove the naga's use of ESP and not only does moving silently around a naga become feasible, but the thief enjoys a +10% bonus to his *Move Silently* and *Hide in Shadows* die rolls.

Since dark nagas are reptilian, all reptile-specific magical items (*potions of reptile control*, *sword +1/+4 vs. reptiles*, *arrows of reptile slaying*) can be used at maximum efficacy against them. It should be noted that while nagas are not snakes, they are nonetheless subject to the effects of a *snake charm* spell (although they still receive a +2 to their saving throw). They are not affected by the *snakes to sticks* spell, however.

"Because their sexual makeup is quite obvious on the dissection table, while their mental abilities are not!" fumed the sage, angered at Dreelix's tone of voice. "I've only seen one of these things before, and that was years ago!"

"Let's all settle down," suggested Buntleby. "So the thing can read our minds: What can we do about it?"

"Hello?" called the naga's voice from the distance. "Anybody there?"

"What we need is a mind blank spell," suggested Zantoullios.¹⁴ "I think I might have one, on a scroll."

"Here?"

"No, back at the lab."

"Well, forget it then," said Buntleby. He knew full well the state of the converted barn Zantoullios used as a laboratory—it would take the wizard the better part of a week to find anything in that mess of notes, papers, and half-finished experiments. "We need to see what the naga's hole is like. Lady Ablasta—do you have a wizard eye spell available?"

"As it happens, yes." Buntleby had been certain she would; Lady Ablasta took the stereotypical "nosy old lady" image to new magical heights. Her neighbors kept few secrets from her magical snooping—not that she'd admit to anything, mind you.

"Then, if you don't mind, cast it here, out of range, and send it on down the hole." Buntleby helped the conjurer to the ground, where she sat ramrod straight, skirts tucked beneath her, and prepared the spell.

"I'm getting bored down here!" cried the naga. "You guys still there, or what?"

"What are you thinking?" Dreelix asked Buntleby.

"You're right: Since we can't seem to get the naga to come out here, it may be necessary for one of us to go in there."

"How? By crawling?"

"I've got a teleport spell memorized. If there's enough room down there, I might be able to pop in, throw a charm monster at it, and convince it to crawl out into the open."

After a few minutes of preparation, Lady Ablasta announced: "I'm ready."

"Send it down, then, and tell us what you see."

The Monster Hunters all gathered around their sole female member, listening to her every word. "I'm at the entrance of the pit," she said, eyes closed, concentrating on the invisible eye she had called forth. "I'm going down: ten, fifteen feet. Oh! There's the nasty critter right there, looking right at me.¹⁵ Well! It's sticking its tongue out at me!"¹⁶

"Can it see you, do you think?" asked Willowquisp.

"I'm not—no, I don't think so."

"What do see around you?" asked Buntleby. "How big is the chamber?"

"Not very. It's roughly circular, maybe fifteen or twenty feet across.¹⁷ There's a small pile of coins along one side, and something sticking up out of them. No, several somethings."

"Take a closer look if you would, please."

"Flasks. They're glass vials."

"Potions," said Willowquisp. "That makes sense."¹⁸

"How tall is the ceiling?" asked Buntleby. "Would I have room to stand?"

"It's hard to say," said Lady Ablasta. "Maybe if you stood hunched over."

"Anything else in there that you can see?"

"No, I don't think so."

"What about the naga itself? Anything else I should know?"

"No, it's just sitting there. Wait—there's something on the end of its tail. Goodness, it's a ring!"

"Magical, do you think?" asked Willowquisp.

"I have no way of telling."¹⁹

"Okay, I think that's all we can learn this way. Thank you, Lady Ablasta."

"Are you going to do it, Buntleby? Teleport in?" asked Willowquisp.

"It seems like our best bet."

"What should the rest of us do?"

"Stay here. I don't want you getting too close, or it'll read your minds and learn about the plan."

"Makes sense," agreed Dreelix, always willing to stay out of danger whenever possible.

"Okay, then," said Buntleby, crouching over and mentally preparing himself for the teleport. "Wish me luck."

A few magical words and gestures, and the young wizard popped out of view. Almost immediately, he found himself in a dim cavern, standing in a

15. Like all snakes, the dark naga has no eyelids. Instead, it has developed transparent scales that completely cover its eyes, protecting them from dirt and grit. As a result, the naga is unable to close its eyes, and they remain open and staring even when the creature sleeps.

16. Like a snake, the dark naga has an organ (called the *Jacobson's organ* or *vomerinal organ*) on the roof of its mouth with which it identifies scents. The forked tongue flickers out, captures molecules of scent, and transfers them to the organ for identification. This process goes on constantly and allows the naga to track prey by their scent-trails.

17. Dark nagas hibernate during the winter months in underground burrows, or *hibernacula*. The available number of such winter dens determines how many nagas one might find in each hibernaculum—in areas where such holes are uncommon, a greater number of dark nagas than are normally found together will be present. Once warmer weather returns in the springtime, the dark nagas each go their separate ways.

18. Lacking hands, a dark naga's treasure tends to be those things that it can actually use. Coins and gems are hoarded to pay humanoid races for services the naga is unable to perform itself (like dig-

ging pit traps). Potions and scrolls are common items in a dark naga's treasure hold, as the creature can use each of these items easily. (They usually prop up potion flasks with coins or rocks, and have the cork stoppers on loose enough to enable quick opening with their mouths.) Scrolls are usually unrolled and held open with a small stone in each corner, allowing the naga to cast the scroll spells quickly. Dark nagas also collect spellbooks, turning the pages with their tail spikes or tongues.

When transporting its treasure from one location to another, the dark naga swallows the items and shifts them to a rubbery, baglike organ attached to one side of the creature's esophagus. This organ is thick and resilient enough to resist being punctured by sharp objects (the dark naga can therefore swallow daggers, knives, and other bladed weapons), and has an added bonus: The organ shields magic from all detection spells.

19. Dark nagas occasionally wear a ring or two on their tail spikes. This is done merely for ornamentation; lacking fingers, nagas cannot use magical rings. However, there are a few types of worn magical items that nagas can employ, among them hats, caps, and helms. For obvious reasons, they cannot wear magical eyes, capes, cloaks, robes, girdles, gauntlets,

gloves, boots, slippers, or shoes. It might be possible for a naga to wear a magical brooch, amulet, or medallion, if some way of attaching it could be contrived (pinning it to a worn hat, perhaps).

20. All of a dark naga's spells require verbal components only; besides the verbal-only spells listed in the *Player's Handbook* (*feather fall*, *hold portal*, *blindness*, *knock*) and *Tome of Magic* (*Hornung's guess*, *far reaching I*, *minor malison*), nagas learn verbal-only spells from evil dragons, pherimm, or other creatures able to cast act-of-will spells. The naga can also devise new spells and learn to modify standard spells to verbal-only versions, but such experimentation is both slow and expensive. It generally prefers to work for an evil, spell-using creature, receiving spells as its pay.

A dark naga in the employ of another creature usually serves as an overseer of the lower servants: It might be a black dragon's chief lieutenant in charge of keeping the lizard man minions in line, or slither into battle with a band of orcs, serving as the magical strike force commander. In the *RAVENLOFT* campaign, dark nagas are most often found in the service of a hebi-no-onna (see the *MONSTROUS COMPENDIUM RAVENLOFT Appendix III: Creatures of Darkness*, page 55).

loose pile of coins. The dark naga was directly in front of him, its head turned away, looking toward the nearly vertical tunnel to the surface.

Buntleby began the words of the charm monster spell. Halfway through, the creature spun around, stared the wizard straight in the eye, and began the words of a spell of its own.²⁰

Both spells finished about the same time. Before Buntleby could see if his spell worked, the world went gray, as if a deep mist had covered his eyes. Blindness spell! he realized. "Stay where you are!" he commanded.

"I live to obey, master," responded the naga; Buntleby breathed a sigh of relief. He was therefore taken completely by surprise when the creature's tail spike jabbed him in the side of the leg. "Fooled you!" the evil serpent chuckled in glee.

Buntleby tried to come up with the words to an appropriate spell, but his thoughts were getting sluggish, and it was hard to concentrate. Magic missile? No, he'd have to see to target it. Dispel magic on the blindness then? That sounded right. But how did that spell go again?

Buntleby crashed to the floor of the cavern, snoring loudly. The naga cast its ESP senses quickly around: None of the other humans were within range. "Dinner time," it said. "Thank you, Dark One, for this bounty which so foolishly delivered itself to me."²¹

Running its forked tongue across its finely scaled lips in anticipation, the naga unhinged its jaws and maneuvered them over Buntleby's head. Shifting back and forth and side to side, the creature managed to work its jaws past the young wizard's shoulders when the cavalry arrived quite unexpectedly.

A small clattering of pebbles falling down the entrance hole was the only

Ozzie just chuffed and returned to his snack.

warning before Ozzie came flying out of the shaft, to land squarely on the naga's back. The naga had been concentrating on its meal and scanning only for nearby human thought with its ESP powers; Ozzie's animal thoughts snuck right past its awareness.

With its mouth extended over Buntleby's prone form, both the naga's fangs and its spells were inaccessible for combat. That left only its tail, which it swung wildly in an attempt to pierce the six-limbed creature that hung onto the back of its neck.

Ozzie wasn't in much danger, though. The naga couldn't see the osquip from its prone position and had no way of extricating Buntleby now that he had passed beyond its mouth.²² A few bites to the back of the head with teeth that could eat through solid stone, and the dark naga was no more.

Several minutes later, Zantoulios wriggled his skinny body headfirst down the naga's entrance tunnel and landed in a heap. There he found an

amazing sight: Buntleby's lower half projecting from the dead naga's mouth, and Ozzie nibbling contentedly on a pile of stone pebbles by his master's feet. Buntleby's snores echoed strangely from deep inside the slain creature's throat.

"Is he okay?" came Willowquisp's worried voice from above.

"He's fine," called Zantoulios, as he bent over to pat the top of Ozzie's leathery head. "Who's a good boy then, Ozzie?" he asked.

Ozzie just chuffed and returned to his snack.

Oddly enough, in Johnathan M. Richards' home campaign, many of the monsters and NPCs his players encounter are as sarcastic as the dark naga portrayed in the story above. Johnathan claims this is mere coincidence.

21. There are two main gods in the naga pantheon: Shekinester of the Triple Aspects, and her son, Parrafaire, the guardian of magical secrets and hidden places deep below the ground. Parrafaire has no formal worshippers; Shekinester, as the creator of the "true" nagas, is thus worshiped by lawful good guardian nagas, neutral water nagas, and chaotic evil spirit nagas alike.

The lawful evil dark nagas, however, are not "true" nagas—they are believed by some to be a mutant strain of spirit naga, possibly the result of wild magic. (The fact that dark nagas are hermaphroditic while "true" nagas have two distinct sexes is the greatest argument against their being a form of

"true" naga.) In any case, dark nagas rarely worship the naga gods, preferring "generic" evil gods such as the Elder Elemental God or the Dark God. Those dark nagas serving closely with powerful creatures like beholders or dragons often adopt their leader's faith. Regardless of the god or gods they choose to revere, dark nagas never become priests or gain priest spells.

Details on the gods mentioned above can be found in *Monster Mythology*.

22. Like snakes, a dark naga's teeth point backward down its throat, preventing struggling prey from escaping once the naga bites down on it. Once the prey is dead (or immobilized), the naga works

the body down its throat with a back-and-forth ratcheting motion, shifting one side of its hinged jaw further down the prey's body, then repeating the process with the other side, and so on. Because of the angle of the naga's teeth, once a body has made it past the naga's throat, there's no way for it to "spit" the body out; it must continue the process until the prey has been completely swallowed.

Once it has devoured its prey, the naga takes up to a week to digest it. Elevated body temperatures can speed up the digestion process, so a dark naga may seek to bask in the sun after eating a large meal.

Ecology of the Dark Ones

Enigmas Wrapped in Shadows

by Paul Leach • illustrated by Peter Bergting

For our kind, there is nothing but the darkness.

—Dark Ones' Proverb

The mysterious and unpredictable dark ones lurk in the tenebrous tunnels and isolated recesses of the Underdark's vast night. Robbing and killing as they please, these strange humanoids embody the veiled dangers and deepest secrets of the underground world, preying on the unwary and shunning anything to do with the forsaken world of light. While monsters of unsurpassed evil and power are the stuff of the Underdark's all too real nightmare, the dark ones remain its forgotten highwaymen—and that's exactly what they want.

Few people know the origins of the secretive dark ones or why they appear to be split between two different races: dark creepers and dark stalkers. The diminutive dark creepers are hoofed and pale, while the lithe, almost ghostly dark stalkers look frighteningly akin to normal humans. The truth of their genesis and dual-species society is one of the endless night's

best-kept secrets, a past that all but these enigmatic denizens of darkness have forgotten.

DARK ONES IN THE WORLD

Dark ones are found almost anywhere underground, but they are most often encountered near trade routes or lurking on the outskirts of wealthy settlements. Some of them live in cave warrens, catacombs, or sewers of the surface world, venturing into the land above on moonless nights. They maintain temporary lairs near their victims but have larger communities too secluded to be found by any but the most thorough explorers. The shadowy bandits do little to alter their natural surroundings, preferring to leave as little trace of their existence as possible.

Dark ones are subject to the Underdark's predators, but they use their stealth and special abilities to avoid most creatures. Purple worms, umber hulks, and xorns are more difficult to circumvent, since these monsters all hunt using tremorsense, leading dark ones to exercise extreme caution when in areas roamed by such

creatures. Dark ones rarely antagonize communities of dangerous humanoids, out of fear of provoking retaliation, and every now and then, they make alliances with such races or local monsters. More commonly, dark ones support their communities by raiding caravans from distant lands and travelers passing through their territory.

THE LIFE OF THE DARK ONES

Dark creepers and dark stalkers are born in a similar manner as humans and grow to maturity within 15 years. Parents share the responsibility of rearing and teaching their children with the other adults of the tribe. The young play games that reinforce essential survival skills such as concealment and observation. Young dark ones learn to hate the lighted world and consider any who carry light with them to be enemies. Their elders teach them that other creatures that dwell in the Underdark and outsiders are sources of wealth, amusement, and danger. Dark ones consider the whole Underdark their home, and they spend their lives wandering, hiding,

and stealing. Dark creepers live to be about 50 years old, while dark stalkers sometimes surpass 75 years.

When a dark one dies, its body decomposes in a manner befitting this strange race. Unless eaten or otherwise prevented from normally decomposing, the body deteriorates at such a rate that it vanishes within a month. Patient observers can see thin wisps of shadowy smoke rising from a corpse, although this opportunity is rare, since dark ones try to recover their dead whenever they can. Many of the natural vaults that serve as their tombs have been used by countless generations. "Born of the dark, we return to the dark," is their simple prayer and hope.

PHYSIOLOGY

Dark stalkers and creepers share many common traits owing to their shared heritage. Their eyes are quite disturbing, appearing as sinister slits uniformly colored a dead shade of gray. While they do have irises and pupils, these features are well camouflaged, reminiscent of the sightless eyes of cavern-dwelling fish. Dark ones are not blind, but neither do they possess darkvision. They rely on elevated senses of smell and hearing to provide them with an unmatched ability to navigate in total darkness.

Their soft voices remain so, even when used in anger. Dark ones do not so much speak words as breathe them. When they speak their dark tongue it sounds like a series of punctuated sighs, and they rely on subtle changes in tone to convey meaning. Even when dark ones converse in other languages, their voices sound like wind currents lost in a tunnel.

Their hair ranges in color from stark white to an inky black, and their skin is cool to the touch. Dark ones tend to be light for their size and they move as if they have no more substance than shadows. They conceal themselves in cloaks, masks, turbans, and wraps, preferring garb that covers their faces.

PSYCHOLOGY

Darkness ultimately defines all aspects of dark one life, from the core beliefs of each individual to their society as a whole. They believe nothing lasts forever, except for the dark, and therefore little else really matters. This is not a morbid or depressing certainty to

dark ones, but the basis for their freedom, which they value above all else. They see no reason to tie themselves to the demands of land, industry, or conquest; neither do they have much use for glory or honor. Dark ones believe city walls and ideals were created to provide false security; city walls only make it easier for an enemy to find you, and moralistic ideals can only convince you to die for no reason at all. Dark ones see the civilized races of the world as pathetically clinging to ruinous traditions of self-deception, greed, and hatred, and dark ones eagerly capitalize on these conceits to take what they need. They think of themselves as wary survivors, while others call them cowardly parasites.

While dark ones have a relaxed attitude about many things, they have an almost maniacal fear and hatred of light that goes beyond the physical pain it causes them. They revile the sun as a merciless entity that maliciously blinds them and renders their survival skills useless. Dark ones believe that earthly fire and light-shedding magic were weapons the sun bestowed upon the world to help the brutish surface dwellers hunt and destroy them. Because of this, they refuse to engage in any type of metallurgy and rely solely on theft for their metal weapons, tools, and jewelry. Dark ones loathe blacksmiths due to their connection to the sun's power, even though they crave forged wares.

Dark ones often refuse to openly communicate with other races as a result of their paranoia. They learn the languages of other races so they can use the knowledge to better understand and spy on their prey. Dark ones learn languages either by secret observation or through tribal tutors. To speak to an outsider is taboo and should only be done in cases of dire necessity. Communicating with outsiders is too close to sharing or accepting the ways of those who might destroy the tribe. Dark ones never teach their own language to outsiders.

DIET

Dark ones are omnivorous, but their Underdark habitat and fear of fire often limits their diet to edible fungi and insects. They have a limited tolerance of raw meat and fish but prefer them cooked if they have access to a steam vent or hot springs. Smoked meat and

baked goods are often priority targets during raids.

INDUSTRY AND THE ARTS

Dark ones obtain most necessities by gathering what they need from nature or hapless humanoid, but they do craft some items for themselves. They excel in preparing dyes from fungi, algae, and strange minerals, which allows

DARK ONES AND THE FIEND FOLIO

The dark ones first appeared in the original printing of the *Fiend Folio* in 1981. Along with other staples from that bestiary (such as the drow, githyanki, and slaad) they have appeared in dozens of adventures since their inception and have long been a favorite of DMs and players alike. Continuing the tradition, both dark creepers and dark stalkers appear again on pages 37-39 of the 2003 printing of the *Fiend Folio*.

them to darken their garments to the color of deepest shadow. Other substances are used to cure monster hides, enabling dark ones to make leather armor, pouches, and belts. They sometimes weave their own tunics, pants, and cloaks, but they usually prefer to modify stolen items.

Dark ones do not bake ceramic containers and instead chemically treat and seal fungal spore pods (typically the shape and size of large potatoes) to create the organic equivalents of ceramic flasks. While the podskins have a number of mundane uses, they are perfect for delivering dark ones' diverse arsenal of alchemical weapons.

A tribe of dark ones often has several apothecaries who create poisons from Underdark flora and harvest the poisons and secretions of such creatures as carrion crawlers, scorpions, and other vermin. The apothecaries also specialize in shadow essence poison (see page 39 of the *Fiend Folio*), which they make by mixing a few inert ingredients with drops of their own blood.

Dark one spellcasters use stolen masterwork weapons to fashion magic items such as *assassin's daggers*, *daggers of venom*, and seeking and wounding ammunition. They also enchant rings and wondrous items, especially *bracers of armor*, *cloaks of displacement*, and *rings of invisibility*. With the aid of the tribe's alchemists,

potions and oils are also frequently produced, usually *potions of cat's grace*, *potions of invisibility*, and *oils of darkness* for their hunters.

Dark ones do not use written words to record their history, religion, or culture; rather, they know who they are and what they have suffered, and that is enough. Like city walls and foolish bravery, written records are the fruits of vanity that can only help your enemies. They are a race without mythic heroes, and each generation slips silently into the peaceful shadows, continuing the exodus begun long ago. Their hushed chants and few poems are imbued with an inspired solemnity.

RELIGION

Dark ones do not worship specific gods as most other races do, and in fact find the concept abhorrent. Rather, they revere darkness as an abstract force, a destination after death, and a personal ideal. How legitimate this religion is remains a matter of much debate, but the fact that dark stalker clerics mysteriously receive spells and that all dark ones are inexorably claimed by shadows after death lends credence to their beliefs. Dark ones have few clerics and those that exist are almost always dark stalkers. These clerics most often have access to the Darkness (from the *FORGOTTEN REALMS Campaign Setting*), Luck, Trickery, and Underdark (from the *FORGOTTEN REALMS Campaign Setting*) domains.

Although no one can be sure, many sages speculate that dark ones' refusal to worship specific gods led them to their current state. They might once have been members of a culture that never came to trust deities, or they could be heretics who turned their back on their gods. Another theory suggests that the forebears of dark ones were offered protection by the god of the sun and, when they refused him, were forever cast from his sight, cursed with their aversion for light. Whatever their history and however it ties to their strange religion remains yet another of dark ones' countless mysteries.

SOCIETY

Dark stalkers have always been the leaders and caretakers of dark ones. There is no formality to their rule, and authority is usually shared between all of the community's stalkers. In a feat of governing unheard of in nearly all other societies,

dark stalkers never flaunt their rule or lord their authority over dark creepers, showing an unaccustomed affection for and understanding of their underlings. While the dark creepers are not servile, they rarely disobey their leaders.

Dark ones have no real laws, but they do have strong taboos against harming other members of the tribe. Murder is almost as bad as teaching an outsider their secret tongue, and either offense is worthy of exile or death. Betraying the tribe's lair to enemies is unheard of. Stealing is not an issue in dark one society as they are not a particularly greedy people. Thefts can only lead to counter-thefts in a tribe of pickpockets.

KILLER CREATURE COMBOS

Dark ones tend not to ally with many races, but they find natural predators very useful. Supreme opportunists, they sometimes merely wait for passers-by to stumble in another monster's lair, or they purposely lead headstrong enemies into its maw. While their prey is busy handling another creature, they take advantage of the situation to pick pockets and make attacks of their own.

Dark Creepers and a Cloaker: A cloaker with two dark creeper minions can be a considerable threat. By positioning themselves at opposite sides of a cavern, the creatures can attempt to catch enemies between them. The cloaker primarily uses its nausea and stupor moan effects (keeping dark ones outside the 30-foot range of most of its subsonic attacks) so the creepers can easily make sneak attacks. Two dark creepers and a cloaker are an EL 7 encounter.

A Dark Creeper and Darkmantles: Dark ones often lurk near small clutches of darkmantles, eagerly aiding the camouflaged predators and looting the bodies of their prey. By waiting until the darkmantles have used either their darkness or constrict ability, the dark creepers can slink close to targets and make sneak attacks while their opponents are either unaware or grappled. One dark creeper and two darkmantles are an EL 4 encounter.

Dark Creepers and Shocker Lizards: Dark ones are adept at using unintelligent Underdark creatures in simple but elegant ambushes. While two creepers wait at the far edge of a lair of four shocker lizards, a third creeper, pursued by PCs, dashes through the lair and sets the lizards on alert. When the PCs enter the lair, ranged attacks from the dark creepers aggravate the lizards into attacking the nearest targets, probably the PCs. While the four shocker lizards deal 8d6 points of damage with their lethal shocks, dark ones make sneak attacks. Even if they are exposed to the lizards' electrical attacks, dark ones' evasion ability gives them better-than-average chances of surviving the attacks. Three dark creepers and four shocker lizards make an EL 8 encounter.

A Dark Stalker and Dark Creepers:

Dark ones are most commonly found in small hunting or raiding parties consisting of several dark creepers and a single dark stalker leader. Usually, dark ones hide using their shadow cloak abilities and slip close to their prey under the cover of the dark stalker's *fog cloud*. Dark creepers then sneak attack targets and retreat, trying to confuse and separate their enemies while the dark stalker watches and waits. Although the dark stalker aids overwhelmed creepers, he seeks out and concentrates his sneak attacks and poisoning on the strongest-looking enemy. After such an initial attack, the entire band of dark ones retreat, only to repeat the tactic on their weakened opponents again and again. A dark stalker and five dark creepers make an EL 9 encounter.

A Dark Stalker and Dire Weasels:

Many dark stalkers favor dire weasels as both pets and hunting partners. With the dire weasel's attack and blood drain abilities, their dark stalker masters often send the animals ahead of them in combat. Once the weasels have caused Constitution damage, the stalkers take advantage of their enemies' lower Fortitude saving throws, thus maximizing their poison attacks. A dark stalker and four dire weasels make an EL 7 encounter.

A Dark Stalker and Rasts: Although dangerous creatures to train, or even be near, dark stalkers greatly value the aid of rasts. A rast ally is extremely versatile, being able to drain an opponent's Constitution or paralyze it from afar, allowing the dark stalker to use its poison or sneak attack abilities at its leisure. Also, the alien nature and sheer savagery of a rast makes one a perfect distraction for a far more stealthy dark stalker. A dark stalker and one rast make an EL 6 encounter.

A Dark Stalker and Troglydites:

Dark stalkers have been known to follow troglodyte hunters and steal their prey. While a dark stalker hides and keeps its distance from the troglodytes, it attempts to make sneak attacks with its poisoned javelins against characters sickened by the troglodytes' stench and suffering a -2 on saving throws. Once either the troglodytes or their prey is weakened, the dark stalker attacks. A dark stalker and two troglodytes are an EL 5 encounter.

VS. PCS

Dark ones use cunning and efficient methods to defeat their opponents. They are ruthless but not sadistic; murder is only a means to an end and is not employed if the dark one can simply pick a pocket instead. Dark ones zealously kill those who invade their home caverns,

though, and lightbearers provoke escalated violence under any circumstances.

Sneak Attacks and Sleight of Hand:

Dark ones use ambushes against lone scouts and stragglers, but sometimes they attack small groups, especially if the group uses artificial light. A band of dark ones usually splits its attacks. One group

NEW ALCHEMICAL ITEMS

Dark ones have a peerless understanding of the alchemical uses of fungi and vegetation native to the Underdark. Using the hundreds of strange and deadly plants that surround them, dark ones have created a wide variety of distinctive alchemical items. The majority of these items are splash weapons, the rules for which are on page 158 of the *Player's Handbook*.

BROWN MOLD OIL

Brown mold oil is ground brown mold neutralized by a compound of lime and algae. When exposed to air, the compound turns gummy and inert, allowing the brown mold to revive for 1 round to cause cold damage to any creature it touches. A flask or podskin of brown mold oil has a range increment of 10 feet and is used as a thrown splash weapon. A direct hit deals 2d6 points of nonlethal cold damage, while all creatures within 5 feet take 1d6 points of nonlethal cold damage from the splash. Brown mold oil may be created with a successful DC 25 Craft (alchemy) check.

Cost: 75 gp; Weight: 1 lb.

OIL OF NAUSEA

Odorous resins and slimes are used to create oil of nausea. Flasks and podskins of the oil have a range increment of 10 feet and are used as thrown splash weapon. Those directly struck by oil of nausea must make a successful DC 15 Fortitude saving throw or be nauseated for 1d4 rounds, while those within the 5-foot-splash radius must make a DC 10 Fortitude save or be nauseated for 1 round. Oil of nausea may be created with a successful DC 15 Craft (alchemy) check.

Cost: 60 gp; Weight: 1 lb.

POISON-FRIEND POD

These fungal spore pods are chemically altered so that their otherwise harmless clouds cause creatures to be more susceptible to poison. A poison-friend pod is a thrown weapon with a range increment of 10 feet. Upon striking a creature or square, these fungi erupt in a 10-foot cloud of spores that disperses in 1 round. Anyone caught in the cloud must make a successful DC 15 Fortitude save or take a -4 penalty on all saving throws against poison made in the next 10 minutes. Poison-friend pods may be created with a successful DC 25 Craft (alchemy) check.

Cost: 50 gp; Weight: —.

SHADOW HAZE DUST

Shadow haze dust is a potent eye irritant that obscures its victims' vision with dark hazes. One bag or podskin has a range increment of 10 feet and fills a 10-foot-radius cloud with the dust. Those within the cloud must make a DC 15 Fortitude save or suffer a -6 penalty on all Spot checks for 1 hour or until a gallon of water is used to flush the character's eyes. Shadow haze dust may be created with a successful DC 20 Craft (alchemy) check.

Cost: 30 gp; Weight: 1 lb.

SHADOW VEIL

Shadow veil is a black dust created from finely powdered crystals that grow only in the deepest reaches of the Underdark. When stored in bags or podskins, this dust can be thrown as a splash weapon with a range increment of 10 feet. Upon striking a creature or square, the dust erupts in a 10-foot-radius cloud. Although this cloud has no effect on living creatures, it reacts with all nonmagical fires no larger than a campfire within the area, snuffing them out. Torches, lanterns, candles, cooking fires and the like go out instantly, but magical fire (such as a *wall of fire* spell) is unaffected. Although its effect is swift, a shadow veil dissipates quickly, and extinguished fires can be relit on the round following its use. Shadow veil may be created with a successful DC 25 Craft (alchemy) check.

Cost: 40 gp; Weight: 1 lb.

SECRETS OF THE DARK ONES

Dark ones are inscrutable, mysterious creatures that keep their secrets with the same cold silence of the darkness they revere. Although sages, explorers, and those harassed by these Underdark brigands have long sought to unravel the dark ones' secrets, all methods of investigation, from the most potent magical inquiries to ingenious drow tortures, have revealed little. Over the decades, four enigmas have consistently perplexed those brave and foolish enough to pry into the secrets of the dark ones.

ORIGINATING IN SHADOWS

Many races know where they came from or how they came to be, and myths of racial creation are among the best known throughout the world. Such tales are not told of dark ones, however. Of how these creatures came to be, what events or beings affected that creation, and why they bitterly speak of the surface with knowledge akin to hateful memories, only dark ones know. This question is made all the more significant as dark stalkers appear so much like humans, perhaps too like them not to share a single heritage.

THE WORSHIP OF DARKNESS

Rather than worshipping a single deity, all dark ones hold reverence for the dark. To them, all shadows are one—dark slivers of an unfathomable whole that provides them with all they need. Although they keep the specifics of their worship a jealously guarded secret, it seems to serve them well. What force grants the dark ones their powers and claims them in its shadow clutch after they die remains an enigma—one that could challenge mortal understanding of divine power.

A SOCIETY OF SECRETS

All dark ones hide themselves, both in the shadows of their Underdark homes and behind concealing layers of clothing, masks, and other disguises. Constantly trying to hide their natural forms, dark ones consider revealing themselves to outsiders a deeply rooted cultural taboo. Although no one is sure, some who have studied this strange race believe that dark ones hide themselves out of shame for some ancient disgrace. However, the truth of why dark ones hide themselves, and to what end, remains another of their countless secrets.

TWO SPECIES, ONE RACE

Anyone who has encountered dark creepers and their secretive leaders, the dark stalkers, has noticed that the dark ones are in fact two distinct races. While dark creepers seem to be primitive sneaks, little more than cunning goblins, the dark stalkers are elegant and deadly, with the stealth and grace of living shadow. How these two radically different types of creatures have come to live together, and seemingly in such harmony, is perhaps the dark ones' greatest mystery.

Some sages suggest that, despite their lower standing, dark creepers are better adapted to life underground than dark stalkers. This has raised the theory that dark creepers are the result of natural changes affecting a new generation of dark stalkers. However, this possibility throws into question why some dark stalkers hold a respect for dark creeper elders akin to children for their parents.

initiates combat with ranged attacks and another uses sneak attacks to finish off dangerous enemies or pick their pockets. Wizards and sorcerers are prime targets for pickpocketing, as wands, scroll tubes, and potions are prized loot for dark one rogues with the Use Magic Device skill.

Evasion: Dark ones always have an escape plan and typically break off an encounter after only a few rounds. They slow down adventurers by impairing their vision, leading them through difficult or confusing terrain, or causing them more damage. Examples of these tactics include using a dark stalker's *fog cloud* ability at tunnel junctions, and

using pitfalls or underground streams to force pursuers into making Climb or Swim checks, especially after the adventurers have lost Strength due to shadow essence poison. Their evasion tactics are often designed to split up their victims so they have another chance at executing a second ambush on fewer numbers.

VS. DARK ONES

Adventurers should expect short fights intended to relieve them of their treasure and attempts to seriously wound or kill one of them. If the party is dedicated to wiping out dark ones, they

must prepare and execute a cautious search and destroy mission.

Detection: Between dark ones' shadow cloak abilities and bonuses to Hide and Move Silently checks, odds are that PCs will only notice them when they make sneak attacks. Having some kind of light source is a prime way to provoke them into doing this. Spells such as *detect chaos*, *glitterdust*, *owl's wisdom* (to increase a character's Spot check bonus), and *true seeing* are most beneficial when trying to detect dark ones. *Detect magic* is useful if dark ones use their shadow cloak ability.

Stealth and Trickery: Due to the dark ones' blindsight, it is very difficult to surprise them. Only a character affected by both *invisibility* and *silence* is likely to force a dark creeper or dark stalker to make a Spot check. The Disguise skill might also work in some cases, but the best way to get the drop on dark ones is for a PC to disguise herself as something harmless by using *polymorph* or the druid's wild shape ability.

Vision And Light: If someone in the party lacks darkvision, the PCs must protect their light sources from theft or destruction. Locked gauntlets can secure a light-shedding magic weapon or a torch, but the PCs should have access to several essential spells, such as *dancing lights*, *daylight*, and *light*. *Daylight* and *light* work best when cast on items that dark ones cannot easily take, such as breastplates and robes.

Protection: Although dark ones have to get close to take valuables from adventurers, PCs should expect poisoned ranged attacks. Spellcasters should prepare protective spells that can travel with their users, since most fights with dark ones are quick and mobile. Increase Fortitude saves with antitoxin, the Great Fortitude feat, and spells such as *bear's endurance* and *protection from chaos*. Treating poison using the Heal skill is more likely to succeed when supported by a healer's kit, the feats Skill Focus (Heal) and Self-Sufficient, and if the caregiver is under the effects of *owl's wisdom*. *Delay poison* and *neutralize poison* are also highly recommended.

Use Charm: Due to dark ones' weak Will saves, PC spellcasters have a good chance to overwhelm them with *charm person*, *color spray*, *command*, *hold person*, *lullaby*, and *sleep*.

Ranged Attacks: The average dark creeper does not have many hit points,

but it does benefit from its shadow cloak's concealment, good Reflex saves, and evasion. Dark stalkers are tougher, but they are in the minority, and they don't have the evasion ability (unless they're also rogues).

Magic missile is the best damage-causing spell to use against dark ones, since it ignores anything less than total concealment. Good secondary spells are *acid splash*, *chill touch*, *flame arrow*, *ghoul touch*, *poison*, *scorching ray*, *searing light*, and *stinking cloud*; these spells either do not allow a saving throw or are negated by a Fortitude saving throw, which is a dark one's weakest save.

Spectral hand is almost a necessity for delivering spells with a range of touch. If a spell allows a Reflex saving throw, it is likely to be ineffective against a dark creeper's evasion ability.

Melee: A dark one's shadow cloak concealment negates roughly half of all attacks directed at the dark one, so the more attacks a PC can make, the better. While Two-Weapon Fighting is helpful, a monk's flurry of blows ability paired with the Stunning Fist feat can offer several attacks that require dark ones to make Fortitude saves.

Stick Together: Characters should avoid the temptation of leaving slow or disabled party members behind to chase thieving dark ones. Lone PCs are prime targets to these bandits.

DARK ONES AS CHARACTERS

Most dark ones find other humanoids too suspicious or contemptible to join their company for anything longer than a short-term venture. A creeper or stalker who joins a group of outsiders for an extended period of time is exceptional, but if the character and his new companions are able to work out their opposing views on light, they can easily get along. These natural rogues fit in best with those they feel are kindred spirits, such as bandits and spies. In addition to underground settings, dark ones work well in nocturnal city adventures as well as those that take place in dense woodlands and shadowy hills.

Dark Creepers Humanoid

Dark creepers are known to be naturally stealthy and prefer the cool comfort of shadowy places. Spry and sinister-looking creatures, these dark ones' activities are usually assumed to

have some nefarious purpose often far worse than their actual intent. Feared in numbers and demonized alone, dark creepers are able pilferers, but not innately evil creatures. Their interests lie in maintaining their own comfort and the safety of their communities, regardless of the cost to other races.

Members of this class often focus on skills and feats that compliment their natural agility and stealth. Although their shadow cloaks defend them from many threats, dark creepers fear relying on innate abilities alone and develop their skills accordingly.

Racial Traits

- **Small:** A dark creeper gains a +1 size bonus to Armor Class, a +1 size bonus on attack rolls, and a +4 bonus on Hide checks, but they must use smaller weapons than Medium creatures do, and their lifting and carrying limits are three-quarters of those of Medium creatures.
- **Speed:** Dark creeper base land speed is 30 feet.
- **Blindsight:** Dark creepers can effectively see 60 feet without the need of light. Invisibility, darkness, and most kinds of concealment are irrelevant, although the dark creeper must have line of effect to the creature or object to discern it. See page 306 of the *Monster Manual* for a full description of blindsight.
- **Light Sensitivity:** Dark creepers are subject to a -2 penalty on attacks, saves, checks, and damage when they are exposed to sunlight or light equivalent to a *daylight* spell.
- **Skills:** A dark creeper gains a +8 racial bonus on Hide checks and a +4 racial bonus on Move Silently checks when in areas of darkness or shadowy illumination.
- **Automatic Languages:** Dark One and Undercommon.
- **Favored Class:** Dark creeper. The best multiclassing choices for a dark creeper are rogue and ranger.

Class Skills

The dark creeper's class skills (and the key ability for each skill) are Hide (Dex), Listen (Wis), Move Silently (Dex), Sleight of Hand (Dex), Spot (Wis), and Tumble (Dex).

Class Features

All of the following are class features of the dark creeper monster class.

Weapon and Armor Proficiency: Dark creepers are proficient with all simple weapons and light armor, but not with shields.

Feats: A dark creeper receives one feat at 1st level. After 5th level it gains feats normally according to character level, as shown on Table 3-2: Experience and Level-Dependent Benefits in the *Player's Handbook*.

Natural Armor: Dark creepers have thick hides and gain a +1 natural armor bonus to their armor class.

Shadow Cloak (Su): Dark creepers can conceal themselves in shadows the indicated number of times per day. This ability provides concealment in bright light and total concealment in shadows. Darkvision does not negate this concealment, but creatures that can see in magical darkness ignore this effect. Each use of this ability lasts 10 minutes per Hit Die, but the dark creeper can dismiss it at will.

Sneak Attack (Ex): A dark creeper of 2nd level or higher can sneak attack. This ability

NEW FEATS

These feats compliment the dark ones' style of banditry, but other characters (especially rogues) might find them useful as well.

CUTPURSE

You are able to pick the pockets of your melee opponents.

Prerequisites: Improved Unarmed Strike, Sleight of Hand 5 ranks.

Benefit: While engaged in combat, you may attempt to use the Sleight of Hand skill to pickpocket an enemy without provoking an attack of opportunity. This feat allows you to disguise your Sleight of Hand attempts as combat maneuvers.

Normal: Using Sleight of Hand in melee provokes an attack of opportunity.

DEEP POISONING

Your sneak attacks with poisoned weapons are more potent.

Prerequisites: Poison use, sneak attack.

Benefit: When making a sneak attack with a poisoned weapon, you may elect to exchange +1d6 sneak attack damage dice for a +1 increase to the DC of the victim's Fortitude saving throws (maximum 5d6 exchanged for DC +5). You sacrifice outright damage for accurately delivering poison to critical parts of the victim's anatomy.

EXPERT TUMBLER

You can tumble with exceptional deftness.

Prerequisites: Tumble 5 ranks.

Benefit: You may use the Tumble skill at normal speed with only a -5 penalty.

Normal: Using the Tumble skill at full speed incurs a -10 check penalty.

MONSTER CLASS BASICS

Monster classes first appeared in *Savage Species* and allow characters to play monstrous characters from 1st level with no level adjustment. Although monster classes are for the most part presented as character classes, there are several significant differences. Most notably, you must take a monster class as your first level, and characters who take levels in a monster class cannot multiclass until they have completed the full progression of the monster class. This rule keeps characters from gaining the benefits of a monster's type and then quickly switching to a standard class. Characters who take levels in a monster class do not gain Hit Dice, base attack progression, base save bonus progression, skills, and feats at every level, instead gaining them only when it is noted in the class progression. Also, monster classes are likely to alter a character's fundamental form, affecting their ability scores and natural armor. At every level a character gains an ability adjustment, this change stacks with all previous ability score adjustments. However, adjustments to natural armor do not stack. For complete rules and more examples of monster classes see Appendix 1 of *Savage Species*.

functions as the rogue ability of the same name. Sneak attack bonuses gained from the rogue class stack with those from dark creeper levels.

Evasion (Ex): At 3rd level, a dark creeper gains the evasion ability, which functions as the 2nd-level rogue ability.

Dark Stalkers Humanoid

Aloof and decisive creatures, dark stalkers are rarely seen. With a size and shadowy grace far beyond that of their dark creeper brethren, those who see a dark stalker often mistake them for some breed of Underdark elf or dark fey. Not caring what outsiders suppose of them, dark stalkers strive to make their communities as comfortable and prosperous as possible, all while avoiding the taint of foreign ways of thinking or the accursed light.

The mystery and deadly grace of dark stalkers is reflected in their class

progression by their continually advancing Dexterity and Charisma. While the former is often augmented by ranks in the stealthy and thieving skills these dark ones rely on, the latter is used to lead their dark creeper brethren. These traits, in addition to their shadow cloak ability, allow dark stalkers to remain hidden much of the time but be commanding presences when they do appear.

Racial Traits

- **Medium:** As Medium creatures, dark stalkers have no special bonuses or penalties due to their size.
- **Speed:** Dark stalker base land speed is 30 feet.
- **Blindsight:** Dark stalkers can effectively see 60 feet without the need of light. Invisibility, darkness, and most kinds of concealment are irrelevant, although the dark creeper must have line of effect to the creature or object to discern it. See page 306 of the *Monster Manual* for a full description of blindsight.
- **Light Sensitivity:** Dark stalkers are subject to a -2 penalty on attacks, saves, checks, and damage when they are exposed to sunlight or light equivalent to a *daylight* spell.
- **Skills:** A dark stalker gains a +8 racial bonus on Hide checks and a +4 racial bonus on Move Silently checks when in darkness or shadowy illumination.
- **Automatic Languages:** Dark One and Undercommon.
- **Favored Class:** Dark stalker. The best multiclassing choices for a dark stalker are rogue and sorcerer.

Class Skills

The dark stalker's class skills (and the key ability for each skill) are Hide (Dex), Listen (Wis), Move Silently (Dex), Sleight of Hand (Dex), Spot (Wis), and Tumble (Dex).

Class Features

All of the following are class features of the dark stalker monster class.

Weapon and Armor Proficiency: Dark stalkers are proficient with all simple weapons, short swords, and all light armors, but not shields.

Feats: A dark stalker receives a feat at 1st level, and another one at 7th level. After 8th level it gains feats normally according to character level.

Shadow Cloak (Su): Dark stalkers can conceal themselves in shadows the indicated number of times per day. This ability provides concealment in bright light and total concealment in shadows. Darkvision does not negate this concealment, but creatures that can see in magical darkness ignore this effect. Each use of this ability lasts 10 minutes per Hit Die, but the dark stalker can dismiss it at will.

Poison Use (Ex): At 3rd level, dark stalkers are able to utilize poisons without accidentally poisoning themselves.

Sneak Attack (Ex): A dark stalker of 2nd level or higher can sneak attack. This ability functions as the rogue ability of the same name. Sneak attack bonuses gained from the rogue class stack with those from dark stalker levels.

Fog Cloud (Sp): At 8th level, a dark stalker is able to cast *fog cloud* twice a day as a 5th-level sorcerer. ☞

Creature Codex

The Ecology of the DARKMANTLE

by Johnathan M. Richards • illustrations by Dennis Cramer

The eggs started to hatch in complete darkness. This was no surprise, for the subterranean cavern had never before seen the light of day, had never felt the warmth of the sun's rays.¹ In this pitch-black world, a small clutch of leathery gray eggs began warping and buckling as the squirming larvae inside struggled for release.² Finally tearing through the membranes of its shadowy prison, the first of the small, sluglike creatures squirmed out into the eternal gloom permeating the Underdark. Its black hide glistening with the slime of its egg, it instinctively crawled away from the other hatchlings, making its way alone into this new world of darkness and gloom. As it inched along, it scraped the ground with its raspy tongue, tentatively probing for the drab mosses and lichens that would support it during its few short months as a grub.³

Behind the departing grub, others of its kind began hatching. Each slowly inched its way across the cold, damp stone, making its solitary trek in a random direction through a world that knew no light.

"Barkeep, another round!" called Ardorrak heartily, slamming his

now-empty mug down on the table. On either side of him, Thorvin and Haaj swigged down the last of their ale and did likewise, sighing gustily and wiping their beards with the backs of their hands.

Across the table from them, Federico and his cousin, Javorik the Bold, Illusionist Extraordinaire, did their best to keep up. Federico practically inhaled his drink. Rivulets of ale cascaded down either side of his chin as he drank, but he didn't stop until his mug was empty and he could slam it on the table with as much force as his dwarven companions. Blasted if he was going to let a bunch of dwarves one-up him in a drinking contest! Javorik wasn't in quite as much of a desperate hurry; he drank quickly, but not so quickly as to spill any of the ale, wanting to savor its unique taste.

Shandrilla, meanwhile, quietly sipped her mug of dwarven ale and winced at the strong, unfamiliar flavor. She peered distrustfully down at the liquid, as if expecting to find something vile floating in her mug. This was her first time in a dwarven bar, her first sampling of dwarven spirits. Had it been up to her, she would have gone straight back to her room in the inn, maybe indulged in a hot bath. The dwarves, however, had

insisted on treating their new-found friends to a few rounds at their favorite watering hole, and she didn't want to offend them by refusing their hospitality.

The barkeep, a retired dwarven adventurer whose face carried a wealth of battle-won scars, strolled over to their table with a tray of heavy mugs balanced on one meaty hand. "Who're yer friends, then, Ardorrak?" he asked, squinting at Shandrilla and her gnomish companions as he plunked the tray down on the table.

"These here're our new best pals: Federico, Javorik, and Shandrilla," replied Ardorrak, grabbing up a new mug and quaffing down a large swallow. "Ran into a bit o' bother with a carrion crawler or two, we did, an' these three gave us a bit o' needed 'sistance. Wouldn't be here to tell the tale if'n it weren't for them!" The dwarf clapped Javorik heartily on the shoulder as he finished, nearly spilling the little gnome onto the floor.

"Shandrilly here rassled one to the ground, she did, all by herself!" offered Haaj, grabbing up a second mug himself. The bartender looked in disbelief at the slim woman, trying to imagine her in hand-to-hand combat with a carrion crawler. He couldn't do it. Shandrilla just

1. **Darkmantles are highly developed gastropods**, believed by some to have evolved from the common piercer (a classic monster from earlier editions of the D&D game—and, incidentally, the first creature ever covered in an "Ecology" article). They are found almost exclusively underground, lairing in subterranean caverns.

2. **Darkmantles are hermaphroditic**, each creature having both male and female reproductive organs. After mating, each darkmantle goes its separate way and lays a clutch of 6-8 eggs in a secluded crevasse, afterward abandoning them

forever. A darkmantle egg is about the size of a chicken's, but with a soft, grayish shell that allows it to blend in against stone surfaces.

About two weeks after they are laid, the eggs hatch into darkmantle grubs. Each grub is about 2 inches long and resembles a common slug. It has eight primitive eyespots along the sides of its head (three on each side; two toward the front) and a moist skin covered with mucus. Darkmantles leave slime trails behind them as they crawl around on the ground.

3. **A darkmantle grub begins life as a herbivore**, devouring mosses, lichen, and fungus with its radula—a tongue-like organ covered in rows and rows of tiny teeth that scrape away minute particles of edible fiber from the surrounding stone. Only after developing into its adult form does a darkmantle become carnivorous.

smiled at him in embarrassment and shrugged. "S'true!" insisted Haaj.

"This I gotta hear fer meself!" said the barkeep, grabbing up a stool from a nearby table and making himself at home. He scooped up Shandrilla's second mug of ale without thinking and claimed it as his own. As Shandrilla had yet to finish even half of her first mug of the stuff, she said nothing.

The grub had grown during its first few months of life, not just in size but in form as well. Now a full foot in length and as wide around as a human wrist, it crawled along the walls of a gloomy cavern near its birthplace, probing the stone ahead for edible plant fibers with its prototentacles. The grub's tongue-like radula had split in two a week after the creature's birth, then split again, and one final time, leaving a ring of eight writhing appendages wriggling from around the grub's lamprey-like mouth. The tips of each of the prototentacles were still covered in hundreds of tiny teeth, and each housed the creature's sense of taste. As it used its single foot-muscle to crawl along the cold stone, its prototentacles darted about, tasting the stone ahead of it for tiny morsels of vegetable matter.

As had happened several times already during its wanderings, the grub detected one of its own clutchmates clinging to the cavern wall a short distance away.⁴ Suddenly, from out of the darkness of the cave scurried a tenebrous worm, its wicked mandibles wide open in hunger. As its clutchmate was silently devoured by the giant caterpillar-beast, the grub instinctively flattened itself into a narrow crack in the wall of the cavern, vanishing from view.⁵ Peeking out of the crevice, the grub

watched as the tenebrous worm finished its meal and crawled off, finding its way out among the many branching corridors that led to other caverns and other prey. The grub remained safely inside its hidden niche until hunger once again forced it out in search of food.

"So when I find I kin finally move again, there's Shandrilla wearin' two of our packs, and she's got the critter's head pinned to the ground," said Ardorrak. "An' this one"—pointing a thumb at Javorik—"he's carving its guts out with his dagger. I tell you, it was a sight to see!" There was a roar of laughter as the assembled dwarves pictured the image in their minds.

Shandrilla noticed that several other dwarves had gathered around their table during Ardorrak's tale. She looked around at a sea of bearded dwarven faces, all gazing at her with looks of

admiration and respect. Nervous at all the attention, she focused her gaze on her mug of dwarven ale and drained it dry.

"Ah, now that was nothing," said Javorik, looking over at his flustered human companion with a mischievous twinkle in his eye. "You should have seen how she took care of these two puddings we ran into one time." Seeing that all eyes were upon him, Javorik began the tale.

"We were down in this tunnel network, the first time either of us had been in the Underdark, looking for some squimmerall. Anybody ever have squimmerall tea? No? Good stuff. Anyway, so Shanny and I are walking down this tunnel, when we see what at first we think is a pool of oil, oozing right at us..."

Embarrassed, Shandrilla reached for another mug of ale.

The creature, now in its full adult form, was ready for the next big step in its life. It hung suspended from the cavern roof by its muscular foot, hidden among the many stalactites reaching down toward the floor below. Despite its precarious hold it had an excellent sense of balance, thanks to an organ barely hidden underneath the front of its shell.⁶

In the half-light streaming in from the cavern entrance, it would be nearly impossible to distinguish the darkmantle from the stalactites: The creature kept its eight tentacles pressed together in a ring so that they tapered to a point below it. Its eyespots were now spaced evenly about its body, but they provided little more than a vague awareness of the sunlight streaming into the far side of the cavern. As always, the creature's sonic blindsight provided it with an excellent "view" of the surrounding

4. **Darkmantles, both in grub and adult stages,** have blindvision, a form of echolocation that uses high-frequency sound-pulses that are completely inaudible to most other creatures. These pulses provide a sonarlike "sight" to a maximum range of 90 feet. A magical *silence* effect negates the darkmantle's blindvision and effectively blinds the creature. With its blindvision, a darkmantle is able to detect the presence of invisible objects or beings.

The darkmantle's eight eyespots are vestigial, provide the creature with only the slightest differentiation between light and dark—just enough to realize when it has wandered out into the sunlight. (Since their blindsight sonar allows them to "see" only out to a 90-foot range, darkmantles tend to be agoraphobic; they prefer the cramped quarters of the Underdark to the open spaces of the surface world.) The eyespots do not provide the darkmantle with any sort of true vision.

Darkmantle eyespots can replace bat's fur as a substitute material component for the arcane version of the *darkness* spell.

5. **Darkmantles are born boneless** and remain so throughout their lives. As grubs, they can flatten themselves to a half-inch's thickness, squeezing through cracks to avoid predators. In maturity, however, the gastropod shell begins to develop, preventing adult darkmantles from performing such acts of extreme bodily compression.

territory. The shell that had grown from the creature's back⁷ was itself the color and texture of limestone, serving as excellent camouflage on the cavern ceiling. Even without the ever-present shadows that served to cloak the creature from view, the darkmantle's skin color shifted to blend in with nearly any stone surface; to any casual observer, there was no difference between the darkmantle and the stalactites among which it hung.

Then it dropped from the ceiling.

Instinctively, the darkmantle spread wide its tentacles. Doing so spread the tough membranes that had formed

of the bar; it must be getting late, for the crowd around her table had dispersed, leaving her two gnomish companions and their three new dwarven buddies to drink and talk quietly amongst themselves. Shaking her head to clear it, Shandrilla realized there was a drone of voices coming from her table. Looking bleary-eyed at Javorik, she saw that he was speaking. She focused her attention on him and caught him in mid-sentence.

"...never told us what you guys had been doing down there," he said.

"Splorin', mos'ly," replied Thorvin, tripping heavily over his tongue.

"Foun' us a way into this secret temple

Ardorrak. "There was this big old statue carved right outta the stone—some kinda snake-god thingy with glowing red eyes this big around!" He held his hands out, cupping an imaginary circle some four inches in diameter.

"Rubies, I betcha," suggested Thorvin, scratching absently at his beard.

"Rubies, I betcha too," added Haaj.

"Why'd you leave them?" asked Javorik.

"Couldn't get up there!" replied Ardorrak. "They musta been, oh, I dunno—mebbe thirty, forty feet up. We tried climbing the stupid statue, but none o' us is much fer climbing."

Javorik scootched himself forward across the table until he was face-to-face with Ardorrak. "Shanny could do it," he said quietly.

"Huh?" said Shandrilla, perking to attention at the sound of her name.

"You could climb a forty-foot statue, couldn't you, Shanny?" he asked. "A big, strong human like you?"

"Sure," agreed Shandrilla woozily. "No plarbrem—prollbim—kee hee hee hee hee!" She giggled at her tongue's sudden rebellion.

"All right then!" said Ardorrak, eyes shining wildly with the thought of retrieving the one piece of obvious treasure the dwarven trio had left behind.

"No. Prob. Lem," enunciated Shandrilla carefully. When finished, she smiled in triumph at her success and immediately passed out onto the table, much to the amusement of the dwarves.

The darkmantle crawled slowly across the cavern ceiling on its gastropod foot.⁸ Its tentacles dangled below it, tasting the moisture of a rainy night⁹ as it made its deliberate path away from the cave opening leading to the outside world.

As it crawled along the ceiling, the darkmantle suddenly sensed a flurry of motion below it. It was a flock of bats, preparing for a night seeking prey on

DROPPING TO THE GROUND IN SURPRISE, IT SCUTTLED QUICKLY ON ITS TENTACLE-TIPS BACK INTO THE COMFORTING SHADOWS OF THE CAVE, BACK TO THE WORLD IT KNEW.

between them.⁶ The membranes filled with air and slowed the creature's descent; then, by flapping the "wings" thus formed, the darkmantle flew erratically through the cavern for a short distance.⁹ Its aerial path took it briefly outside the cave entrance and into the bright sunlight.¹⁰ Dropping to the ground in surprise, it scuttled quickly on its tentacle-tips⁸ back into the comforting shadows of the cave, back to the world it knew.

Shandrilla realized with a bit of surprise that she was quite drunk.

She looked suspiciously at her empty mug—her third? fourth? it was hard to remember—with eyes narrowed, as if the ale had conspired against her. What time was it? She looked around at the patrons

or sumpin' down there. Real old stuff, nobody'd been around there fer cent'ries."

"Secret temple," echoed Haaj, tapping a finger to the side of his nose and winking suggestively.

"So's we figgered nobody'd mind if we helped ourselves," put in Ardorrak.

"Cleaned up pretty good, too, we did! Didn't leave too much behind us, no sir-ree!" Of the three dwarves, he seemed the least affected by the mass quantities of hard ale they'd all been pouring down their gullets for the past several hours.

"Cept them eyes," remarked Thorvin, belching loudly.

"Eyes," echoed Haaj, tapping under one of his own bloodshot orbs and nodding knowingly.

"Yeah, 'cept for them eyes," agreed

6. The statocyst is a small, baglike organ common in many gastropods. It contains numerous small, sandlike grain particles suspended in liquid, and it aids the darkmantle's sense of balance. In that respect, the statocyst is equivalent to a human's inner ear.

7. The darkmantle's shell begins growing at about the same time as the creature's prototentacles grow long enough to account for half of the creature's total body length. The shell results from mineral intake as the darkmantle's radula scrapes rock surfaces in search of food. Mineral secretions from the pores of the darkmantle's dorsal area gradually build up to form a hardened shell, which continues to grow and thicken as the darkmantle ages and the mineral buildup continues.

8. In its full adult form, the darkmantle's appearance becomes similar to that of an octopus: the narrow body, the long tentacles surrounding the mouth, and the flaps of skin between the tentacles all give the creature a cephalopodic look. However, an adult darkmantle retains its lampreylike mouth.

In addition, the flaps of skin connecting the tentacles reach two-thirds of the length of the tentacles. The darkmantle spreads its tentacles and can use the skin-flaps as primitive wings.

IN FUNCTION, THE DARKMANTLE COMBINES FEATURES OF MANY ANIMAL SPECIES—OCTOPI, SNAILS, AND EVEN FLYING SQUIRRELS.

the surface world. Without hesitation, the darkmantle released the grip of its suction-foot and swooped down upon an unsuspecting bat.

As the two creatures collided in midair, the darkmantle wrapped its tentacles around the hapless bat and squeezed tightly. Immediately, both creatures began plummeting toward the ground.⁹ The darkmantle didn't seem to notice, however, refusing to loosen its grip upon its prey even as both creatures struck the hard cavern floor. Absorbing the impact with its rubbery

tentacles, the darkmantle concentrated completely on its goal: crushing the life out of the bat it had captured. Only after the bat was dead did the darkmantle release its vicelike grip and transfer the carcass to its circular mouth, filled with many sharp, tiny teeth.

"I agreed to this?" asked Shandrilla for what must have been the tenth time, as she traipsed through the underground cavern network once again.

"You were very insistent," agreed Javorik, holding out a torch and hurrying

to keep up with the others. Up ahead, the three dwarven fighters marched at full speed through the roughly-hewn tunnel, eager to get to the secret temple they'd discovered and let their new human companion get about the business at hand—namely, prying the giant rubies from the statue of the weird snake-god they'd uncovered. Federico marched right along with them, determined not to let a bunch of dwarves show him up. If any of the four were feeling any after-effects from their night of heavy drinking, they didn't show it. Javorik

A darkmantle is about 2 feet long when it first reaches adulthood, and it continues to grow until attaining a length of 4 feet. Darkmantles live to about six years, provided another predator doesn't eat them first.

9. **Darkmantles are poor fliers**, flitting through the air at a speed of 30 feet. Because of their boneless bodies and relatively light shells, darkmantles can glide for short distances without moving their "wings," but must otherwise "flap" like a bird to propel themselves. Darkmantles can fly

only short distances at a time, usually only up to the ceiling from a cavern floor or from perch to perch. Darkmantles expose their round mouths while flying, occasionally catching quick meals of small flying insects while in flight near the surface world.

10. **Darkmantles spend almost all of their lives** in subterranean caverns or caves and can be found throughout the Underdark. Those that lair in caves near the surface might occasionally crawl outside at night or on overcast days, but they

rarely stray too far from their cave entrances. Sunlight does not actually harm darkmantles; they're just unaccustomed to it and prefer staying in dark areas. A *daylight* or similar spell can sometimes be used to drive off a darkmantle or at least keep it at bay for a time. However, darkmantles suffer no combat penalties in areas of bright light.

didn't seem particularly affected, either, come to think about it. Only Shandrilla seemed to carry a reminder of the previous night with her: a throbbing headache that wouldn't go away and a mouth that felt like it was filled with old socks. She'd had some tea in the morning, and that had seemed to help for awhile, but not by much, and not for long.

"I don't believe it," muttered Shandrilla to herself, for what must have also been the tenth time. "No more dwarven ale for me, Javorik, ever again!"

"Whatever you say, Shanny."

Since moving deeper into the subterranean passageways, the darkmantle had discovered that it was prey as often as it was predator. In a burst of frantic energy, it flapped its tentacle-wings, lifting it into the stale air and up to the top of the cavern ceiling, where it hoped it would be safe from the large, multi-legged predator that had stumbled

Temporarily out of the carrion crawler's view, it flapped to the ceiling again, snagged a stalactite with a tentacle, and found a quick perch on the ceiling. Getting a good grip with its gastropod foot, it spread its tentacles wide around it in all directions, covering its body with its skin-flaps. Tucked inside itself in this fashion, the darkmantle looked like nothing so much as a slight bulge in the rock of the ceiling.¹¹ Using only quick pulses of sonar to gain an idea of any movement around it, it watched as the carrion crawler entered the cavern, wandered around aimlessly for a short time, and exited by another passageway. The danger was over for now; it had managed to elude its hunter. Nonetheless, it rested motionlessly on the cavern ceiling for several hours, replenishing its energy and making sure that all potential danger was gone before uncoiling its tentacles and exploring the new tunnel network in which it now found itself.

"There it be," said Ardorrak proudly.

less'n you give us a sign!"

The six adventurers stood silently as the echoes of Ardorrak's last sentence reverberated around the huge cavern. Shandrilla looked up at the statue, as if awaiting a cue. It stood, silent and unmoving, gazing out across the cavern.

"I reckon it's okay with him, then," replied Ardorrak matter-of-factly.

"Whaddaya think, Shanny? Can you climb it?" asked Javorik.

"No problem," replied the young woman, smiling to herself as she half-remembered tripping over the simple phrase the night before. She took a deep breath to clear her head and then got down to business. Removing her pack, she started unloading its contents and distributing what she'd need into various pockets and loops on her belt. She checked that her dagger and short sword were in their sheaths; a small hammer went into her belt; a number of short spikes went into a pile on the floor.

"Light 'em up," she commanded Javorik, and the diminutive gnome bent to comply.

"IT'S BEAUTIFUL," SHE WHISPERED.

**"DO YOU REALLY THINK IT'S
RIGHT TO PRY OUT ITS EYES?
IT SEEMS—WELL, SACRILEGIOUS."**

across it.¹² No such luck: The carrion crawler merely altered its course, walking up the wall of the Underdark cavern on its way to the ceiling, its tentacles writhing hungrily before it.

As the worm-monster closed the gap, the darkmantle dropped from the ceiling, gliding a short distance before landing back on the floor. The carrion crawler was again forced to change course, diverting to the wall to once more reach the floor. The darkmantle took the opportunity to crawl down a narrow corridor and out of sight. It couldn't keep running for long; its only hope lay in camouflage.

Shandrilla looked up at the stone carving in appreciation of its fine craftsmanship, but she also noticed that the scale patterns on the serpent god would make suitable hand- and footholds during the climbing process. The red eyes of the stone beast glowed softly as if with an inner light.

"It's beautiful," she whispered. "Do you really think it's right to pry out its eyes? It seems—well, sacrilegious."

"Don't worry about it," responded Ardorrak. Then, in a louder voice he called out: "Hey! Snake-god! We're gonna pull them eyeballs outta yer face,

The darkmantle had slowly learned its way around these deeper caverns, far away from the world of sun and rain.¹³ In many ways these caves were different from those near the surface, but in all of the important ways they were the same. The stone passageways housed abundant life: bats, spiders, insects, lizards. There were stalactites among which to hide, pools of cold, clear water from which to drink, endless passageways and corridors in which to explore. Life was good, food was plentiful: the darkmantle was content.

Then it met up with an entirely new type of food.

Shandrilla paused in her ascent up the stone statue. Pulling one of the small spikes from between her lips with her left hand, she positioned it between her

11. Although the adult darkmantle retains its gastropod foot situated directly above its dorsal shell, it can reach a speed of 20 feet by employing its tentacles as "legs." This is the darkmantle's fastest method of transportation over longer distances; while its flight speed is faster, it is an awkward flier and can stay airborne for only short distances at a time.

12. The darkmantle uses its gastropod foot to climb along walls or ceilings at a speed of 5 feet. It cannot use its tentacles for this purpose, as they are not "sticky."

13. Even in its adult form, the darkmantle's tentacles remain its organs of taste. The last third of each tentacle (the part extending beyond the creature's skin-flaps) remains covered with thousands of tiny teeth, just as they did as a radula and prototentacles. This makes a strike from a darkmantle's tentacles more painful than it would be otherwise; darkmantles inflict 1d4+4 points of damage with each buffet from their tentacles, and such strikes are made with a +4 melee attack bonus.

14. Unfortunately for the darkmantle, it can use its tentacles as wings or as attack appendages, but not both at the same time. For this reason, darkmantles prefer attacking victims on the ground, swooping down from above and engulfing them in their tentacles. Being clumsy fliers, darkmantles rarely target aerial prey, although they might drop down on low-flying creatures that pass by below them. In either case, the darkmantle has a +4 initiative modifier due to the Improved Initiative feat.

IN THIS CONTROLLED ENVIRONMENT, THIS CAPTURED DARKMANTLE DEMONSTRATES ITS LASHING TECHNIQUE.

thumb and forefinger while gripping a jutting stone scale with the rest of her hand. Reaching down for her hammer with her right hand, she tapped the spike into place. The light spell that Javorik had cast upon the spike heads illuminated the side of the statue for twenty feet in all directions. There was another such spike down at the bottom of the statue, where she'd hammered it firmly into place before beginning her dangerous ascent.

She looked up: less than halfway left to go. Returning the hammer to its loop

on her belt, she found a good handhold and continued her climb, the last two remaining glowing spikes protruding from her mouth.

The darkmantle crawled slowly along the ceiling, curiously investigating the steady stream of air blowing its way.

Sure enough, along the edge of the cavern wall was a one-foot-tall gap, twice again as long as it was tall, from which emanated a steady current of air. The darkmantle squeezed its body into the gap, crawling along upside-down on

its gastropod foot and probing ahead with its tentacles.

There were voices coming from the narrow gap.¹⁵ The darkmantle did not recognize them as voices, merely as sounds made by some other creature; the concept of a language was beyond its animal intelligence. It scurried forward, through the gap and into a large chamber. Oddly, there was some sort of light source at work in the chamber; even the darkmantle's weak eyespots could detect the illumination.

Puzzled, the darkmantle crept forward.

15. **Short bursts of flight not only allow** the darkmantle to move faster than it can travel on its tentacle-tips but also breaks up its scent-trail. Many Underdark predators hunt by scent; these creatures often give up when the scent-trail suddenly ends.

16. **This is the second form of camouflage** employed by the darkmantle (the first, of course, being its stalactite "disguise"). Darkmantles usually cover themselves up with their skin-flaps when actively hiding from

predators; naturally, the stalactite disguise works only when the creature is among other stalactites, whereas looking like a lump of rock works just about anywhere.

When sleeping, or during the many months of hibernation, a darkmantle prefers hanging from the ceiling disguised as a stalactite, as it requires less effort for the darkmantle to hang from its foot than to find comfortable holds for each of its eight tentacles. Darkmantles also passively "hunt" in this fashion, hanging motionlessly from the

cavern ceiling and then dropping down upon unsuspecting prey that passes beneath.

When actively "disguised," either as a stalactite or a lump of rock, darkmantles have a +11 bonus to Hide skill checks.

Shandrilla pulled herself up onto the snake-god's head, using its carved teeth as a convenient foothold. Then, straddling the statue's broad snout, she hammered the last remaining light spike into its forehead, right between its red-glowing eyes. "I'm up!" she called down to her companions.

"Are they rubies?" called back Ardorrak.

"Yes, looks like it! Big ones!" replied Shandrilla.

"I knew they was rubies!" chuckled Thorvin, rubbing his hands together in greed and grinning at the thought of how much money a pair of four-inch rubies would fetch.

Up on the snake-god's head, Shandrilla pulled out a large iron spike and proceeded to anchor it into the statue's muzzle. This spike had a hole near the top, through which the young thief secured her thin coil of silken rope. After all, climbing up was one thing; she could see where she was putting her hands on the way up. Climbing down would be harder; she'd have to feel for each foothold in turn, and there

and forth of her slim blade, she felt the gem begin to give way.

Then the world went black.¹⁷

Shandrilla shrieked in surprise, then tightened her grip on the snake-god's muzzle with her legs, afraid of falling off now that she could no longer see. Her first thought was that Javorik had mistimed the duration of his light spells. As she opened her mouth to berate her gnomish companion about his spellcasting skills, she felt something solid strike the back of her head and wrap several ropy appendages around her face, preventing her from making a sound.¹⁸

Panic overtook Shandrilla. In the back of her mind she realized that she was balanced forty feet up in the air and that any sudden movements could potentially push her off the statue's head to a messy death below. Still, it was hard not to squirm around as she struggled to get free. She could feel separate bands of rubbery appendages wrapped around her head and throat, squeezing tightly; instinctively, she stabbed backward with her dagger in an attempt to dislodge the creature from the back of her head.

SHE COULD FEEL SEPARATE BANDS OF RUBBERY APPENDAGES WRAPPED AROUND HER HEAD AND THROAT, SQUEEZING TIGHTLY.

was no guarantee that she'd be back down on the ground when Javorik's light spells ran their course. Shandrilla didn't plan on being plunged into sudden darkness halfway down a forty-foot statue.

Satisfied that her line was secure, she scooted her way back up to the first of the snake-god's eyes. Pulling out her trusty dagger, she ran its blade along the bottom surface of the gem, trying to pry it from the stone. With a few grunts of exertion and some frantic wiggling back

Down below, the sudden lack of illumination up at the top of the statue hadn't gone unnoticed by the dwarves and gnomes. "What's that silly human girl up to now?" muttered Federico under his breath.

"Shanny? You okay up there?" called out Javorik, worry in his voice.

No answer.

"Shanny?" he called out again.

As if in response, an object came hurtling down from above, clattering to the stone floor with a metallic clang. The

little illusionist rushed over to it. "It's her dagger! She's in trouble!" he cried out.

The dwarves all whipped out their weapons—warhammer, short sword, and battleaxe—and looked helplessly up at the statue, its serpentine head now sheathed in total darkness. Federico had his short sword in hand as well, but he was hard-pressed to figure out anything to do with it. "We gotta get up there to help her!" he cried, approaching the base of the statue and attempting to climb it, to no avail.

Javorik, meanwhile, was mentally readying a magic missile spell, but he knew that without being able to see a suitable target, the spell was useless. He had no magical means of flying, levitating, or even spider climbing. Gnashing his teeth in helpless frustration, he cried, "Shanny!" at the top of his lungs.

Up on the head of the snake god, Shandrilla was starting to black out. She had lost her dagger in the struggle with the gods-only-knew-what, and in her panic had completely forgotten about the short sword strapped at her left hip. Blindly grasping around for a weapon—any weapon—her fingers brushed the multifaceted orb of the snake-god's left eye, which she had been prying loose with her dagger before the attack. Grasping it with all her might, she tugged and felt its solid weight fall into her hand. Without further thought, she swung it at the creature adhering to her face. There was a solid thunk as it hit something hard; pleased at the result, Shandrilla repeated the action and noticed the grip of the tentacles loosening up somewhat.

Then the ruby slipped from her fingers, to bounce off the side of the snake-god's head and plummet toward her companions, forty feet below.

The darkmantle was surprised at the initial ferocity of this new type of food. After stealthily creeping up to its intended meal along the cavern ceiling, it

17. **Given its flight abilities**, a darkmantle can travel over quite a wide area. For this reason, darkmantle infestations might seem to spring up overnight, as the creatures cover many miles of territory in their search for food.

The darkmantle, with its tendency toward a high activity rate, can last about a week between meals.

18. **Unlike most gastropods**, darkmantles have an excellent sense of hearing. Their "ears" take the form of numerous tiny grooves or pits spaced evenly through the exterior surfaces of their tentacles. As a result, darkmantles have a +4 racial bonus to Listen skill checks, as well as 1 rank in the Listen skill, for a total bonus of +5.

19. **Darkmantles can cast the equivalent** of a *darkness* spell once per day, cast as if by a 5th-level sorcerer, giving the sphere of darkness a 20-foot radius and a duration of 50 minutes.

Darkmantles habitually employ their *darkness* ability immediately before attacking. Like the spell of the same name, the darkmantle's *darkness* must be cast upon an object touched by the creature. Depending upon circumstances, the darkmantle either casts its *darkness* on a low-hanging stalactite (in low caverns where the

triggered its magical darkness on a hanging stalactite and then pounced to the attack. Gliding to its prey on wide-spread tentacle-wings, it landed smack on target and enveloped the victim's head in its crushing grip.

Then, without warning, the darkmantle's flesh was suddenly being ripped and torn. It was apparently some type of claw, but it tasted of metal when it bit deep into the darkmantle's tentacle. A quick buffet sent the strange claw flying away.

Then, just as suddenly, solid blows were striking the darkmantle's shell, hard enough for it to begin cracking. The darkmantle winced in silent pain,* but kept gripping its prey. Surely, the creature would tire before long!

Then, apparently, it did just that; slumping to the left, the victim slid off the side of its perch and fell toward the ground below.

Shandrilla felt the world start to spin and realized she was mere seconds away from blacking out. Her left hand brushed against her coil of silken rope; acting on little more than instinct, she grabbed it from somewhere in the middle, wound it around her wrist a few times, and leapt from the snake-god's head.

Her consciousness left her at some point on the way down.

Javorik saw her emerge from the inky blackness like a falling rock, some sort of bag over her head. It wasn't until she suddenly stopped her descent and crashed sideways into the statue that he realized she was hanging suspended from her thin line. She dangled by her left wrist, her toes some ten feet above the ground.

The bag was moving, tightening its grip around Shandrilla's head.

"Hands!" yelled Javorik at the dwarves, interlocking his fingers to demonstrate what he wanted, then spouting off the words to his magic mis-spell. Ardorrak and Thorvin dropped

their weapons and locked hands, while shafts of magical energy struck the grayish "bag" on Shandrilla's head.

"Up!" yelled Javorik, as he raced toward the two dwarves and placed his right foot in their interlocked hands. They straightened their postures and threw their hands up over their heads, flinging the gnomish illusionist high into the air.

Javorik landed on the back of Shandrilla's legs and climbed his way up to her shoulders. On the way up he slipped her short sword from its scabbard and stabbed the creature that

happened? What was—that—thing?"

"Beats me," admitted the little illusionist. Some kind of weird tentacle monster. It's dead, though. You sure you're okay?"

"Fine," rasped Shandrilla in response, swallowing hard. Her throat felt raw; it was difficult to get the words out.

"You think you can move, then? We're ready to go, if you are."

"Ruby?" croaked Shandrilla, casting her gaze up at the snake-god statue. Its head was still sheathed in darkness.

Ardorrak approached with a handful of tinted shards. The slivers glinted red

THE DARKMANTLE WINCED IN SILENT PAIN, BUT KEPT GRIPPING ITS PREY. SURELY, THE CREATURE WOULD TIRE BEFORE LONG!

was even now tightening its grip around her neck.

The results were as Javorik had hoped. The monster released its grip on the human to better deal with this new threat; Javorik pierced it under its hardened shell with the sword and flipped it, sword and all, off of his friend and into the air.

The darkmantle found itself unable to fly with a metal sword poking out from the side of its body; it plummeted to the ground and struck hard. Reacting quickly, it rolled up onto its tentacle-tips, ready to scurry away—only to be cut in half by a single stroke of Haa's battleaxe.

Shandrilla awoke on the ground, surrounded by five worried faces. There was a throbbing pain in her left shoulder, and the skin on her left wrist felt raw.

"Shanny? You okay?" asked Javorik, worry in his voice.

"Okay," croaked Shandrilla. "What—

and glowed slightly. "Colored glass," he said disgustedly. "The thing shattered when ye dropped it. Complete waste of yer time."

"Then—let's—go," gasped Shandrilla, pulling herself up to her feet. She cradled her left arm against her stomach, thinking she had probably dislocated her shoulder from the sudden lurch at the end of her descent.

Ardorrak picked up his torch and silently led the others back the way they had come. Javorik and Federico flanked Shandrilla protectively on either side, ready to catch her if she stumbled.

As they exited the forgotten temple, Shandrilla took one last look back at the giant statue. As if on cue, the darkness spell expired, and the snake-god seemed to wink at Shandrilla with its one good eye, glowing a faint red in the shadows.

Shandrilla shivered and turned away.

10

20-foot radius of effect is certain to encompass the darkmantle's intended prey) or upon a small pebble that the creature usually carries with it under its shell for that very purpose. The pebble is imbued with *darkness* and dropped down near the intended victim; the darkmantle follows immediately afterward and attacks.

A darkmantle's echolocation works perfectly within the area of effect of the *darkness* spell, allowing the creature to "see" well enough to attack without the standard chance of missing.

20. When a darkmantle attacks with its tentacles, it makes a grapple attack with a +4 bonus without provoking an attack of opportunity. Once attached, the darkmantle constricts for an automatic 1d4+4 points of damage each round until the victim is slain or escapes. Grappling is described fully on page 137 of the *Player's Handbook*.

If the darkmantle's initial attack misses, it usually flies up to drop onto its prey again.

21. Other than the subsonic pulses of sonar, darkmantles make no vocalizations.

Ecology of the Death Knight

BY MATTHEW SERNETT

ART BY MARC SASSO AND STEVE ARGYLE

“

From the dark into the light,
From the small unto the great,
From the valleys dark I ride
O'er the hills to conquer fate!”

— “Horseman Springing,” Lilla Cabot Perry

None can win the war with death, but losing the war does not mean the combatants have seen their last battle. Warriors who wish to fight beyond the limitations of flesh and blood can seek a forbidden way to steal their souls from fate. The cost of this immortality is death, but the fearless few who pay this price become death's allies. Indeed, death bestows power upon them. Their fleshless bones clad in skins of armor, their brittle fingers clasp weapons with a grip of iron, these knights of death take command of their souls and their destinies. When they charge from the shadowy afterlife into the lands of the living, death knights ride to wage war upon life itself.

HISTORY

The origin of the death knight lies in a period so ancient that only legends can speak of it with authority. Each race has its own version of the story.

For elves, the first death knight was a tragic figure who was tricked into becoming a death knight in order to win his love from the clutches of a rapacious rival. In this version, lies lead the story's hero to death. His rival is not a villain. His lady doesn't truly love him. The wicked fey creature who offers the hero a path to power leads him instead to damnation. After killing his apparent foe and learning the truth of his supposed love, the death knight embraces the flame of darkness in his heart by slaying the lady and turning his grief and rage upon the rest of the world.

To dwarves, the first death knight was a greedy king who could not release his grip on the throne. The king sullied his clan, his kingdom, and the many honored dead who passed on before him by seeking unnatural means of extending his life. Seeing foes and rivals everywhere, he arranged for his children, his relatives, and those who refused his commands to die in battle or exile. With no heirs and no kin, he claimed his throne for eternity by becoming a death knight and transforming his loyal retainers into undead servitors. Dwarven legend says the death knight still sits on his throne and rules over a kingdom of

undead, entombed behind miles of rock by those few dwarves who escaped his reign alive.

Humans relate several competing legends of the first death knight, but all bear a common theme: A man or woman wanted power and received it, and with that dark power, the newly made death knight accomplished its goals. The death knight might have been tricked or cursed, but in these tales the means are unimportant when compared to the ends. Sometimes tragic, sometimes triumphant, these stories teach that great power allows the wielder to achieve great things, even if the price is cursed immortality.

Halfling legend tells what might be the oldest story of the first death knight, and the story is so simple it might be closest to the truth. They say the first death knight arose in service to Orcus, Demon Prince of Undead. The tale's protagonist, a human warrior of considerable skill and renown, was plagued with an unquenchable thirst for vengeance. When denied a position of power he felt was his right, he sought revenge but was denied satisfaction. Bloodied and disgraced, he fled to fell lands inhabited by demons. There he proved his worth to Orcus first by defeating the Demon Prince's minions and then by killing Orcus's enemies. When cultists of Orcus offered the man the power to avenge the slights against him, he readily accepted and became the first death knight.

KNOWLEDGE OF THE DEATH KNIGHT

The following table shows the results of a Religion check as it relates to death knights.

Religion DC	Result
15	Death knights are skeletal warriors who retain the intelligence and combat skills they had in life. They often lead other undead soldiers in a war against the living.
20	Death knights are warriors who chose to become undead. Often they have a specific goal or vendetta that provoked their transformations, but some simply fear the afterlife so much that they instead choose an eternal living death.
25	A death knight carries its soul in its weapon. This weapon has the power to become ghostly and pierce armor as if it was not there. If you take a death knight's weapon, you weaken the knight. A death knight can also surround itself in a burst of unholy fire that burns the living and wreathes undead in dangerous green and black flames.
30	A death knight's soul weapon weakens anyone else who wields it as long as the death knight has not been destroyed. If you break a death knight's weapon, the knight can restore it with a touch. Death knights bolster nearby undead allies, so it's best to separate the knight from its minions.

BECOMING A DEATH KNIGHT

Those who desire the dark powers of a death knight in death must first perform the proper ritual. Discovering the right ritual to become a death knight can be extraordinarily hazardous. Good-intentioned individuals often destroy copies when they find them, and the most fanatical will kill those who seek its secrets rather than allow knowledge of the ritual to spread. False rituals abound—traps laid for the unwise and unwary by those who seek souls for other dark purposes.

Despite this, working versions of the ritual exist, each with its own peculiar requirements. One ritual might simply demand that the performer sacrifice a loved one, while another might stipulate that the caster must die in battle at the hands of a foe while in a graveyard or tomb. Frequently, the supplicant must have spilled the blood of innocents with the weapon that will become the soul weapon.

The rarity of the true ritual drives many to seek it from a surer source, such as the cultists of Orcus. These vile madmen despise the gods and bow only to Orcus, who they believe will one day make eternal undead of them all. As worshipers of destruction, demons, and undeath, cultists of Orcus can never be trusted . . . but they enjoy seeing destructive undead unleashed upon the world, and few undead can be as dangerous as a death knight. The demands made of supplicants are a mystery, but the rites are terrible enough that even most Orcus cultists avoid this particular fate. Perhaps they do not feel worthy, or maybe, like many, they simply fear death.

Fear of death is a luxury those seeking undead knight-hood cannot afford. Instead, they must seek death out. They must hunger for it. They must embrace death to gain its power. Through death, they become death.

SOUL WEAPONS

The ritual to become a death knight tears the ritual caster's soul from his body and binds it to the weapon used in the ritual. The ritual caster dies as the living parts of the body are consumed in unholy green fire. From that conflagration rise the soulless bones of the living person, guided by an evil intelligence that no longer needs a brain for its vile thoughts and an endless hatred that no longer requires a heart to drive its dark passion.

A soul weapon is similar to a lich's phylactery in that the death knight's soul resides there instead of in its body. But in most other ways, the soul weapon is the opposite of a phylactery. For a lich its phylactery is a weakness that allows its permanent destruction, but the soul weapon is the death knight's greatest strength. A death knight literally wields its soul as a weapon. The soul weapon's strikes burn with death, and at the death

knight's command it can become immaterial, passing through armor and shields to strike at its foes' unprotected flesh.

A death knight need never fear its soul weapon's destruction, for with a thought the knight can restore the weapon to wholeness and unwholesome power. If the weapon is taken, a death knight becomes weakened and distracted, distraught by the loss of its soul and consumed by the need to recover it. However, no other creature can wield a death knight's soul weapon without feeling despair, so few can withhold a soul weapon from a death knight indefinitely.

PHYSIOLOGY

Death knights have no flesh and blood and thus lack the needs of a living body. They are tireless warriors who only desire vengeance, conquest, and other bloody evils. Despite lacking muscle and heart, death knights maintain the strength and vigor they had in life.

Like many of the living dead, death knights can be destroyed by damaging their bodies. Although they feel little pain, enough punishment can break their bones. Unlike a lich, a death knight cannot take refuge in a phylactery, and it does not reform from its soul weapon. When its earthly body is destroyed, a death knight's soul leaves its weapon and travels to whatever dire fate awaits it in the afterlife. None can say with assurance what happens to the souls of death knights. Some death knights might believe they know the fate of their souls, and that knowledge spurs them to maintain their undead existence by any means. For the rest, the afterlife is an intangible and terrifying unknown. If no devil or vile deity seizes a death knight's soul, the knight can expect no quarter when its soul is weighed by the gods.

PSYCHOLOGY AND SOCIETY

Those who seek knighthood in death tend to be courageous and ambitious individuals. Either loners or leaders in life, in death they become both, leading lesser undead but isolated from mortal society. A group of death knights might form a cadre of dark riders, but even among such a collusion of evil, one death knight typically assumes leadership over the rest. The most ancient among them might even have been the one to corrupt the rest, creating a society of undeath.

Although on rare occasions a person has been transformed into a death knight through accident, deception, or outside force, most death knights hunted for their undead fate. They might have been motivated by fear of the afterlife, but those who seek to deny gods or devils their souls cannot be considered cowards. Rather, the desire for knighthood in death stems largely from a desire for power. Those who become death knights are often already powerful warriors, so the temptation

of undeath must offer them something mortality cannot: power unmitigated by age.

Most who turn to death as a means of power are frustrated in life, thwarted in their efforts to achieve their ambitions. Defeat is less tolerable than death, and they are willing to trade flesh and life for the power to avenge themselves or to accomplish a goal. Upon achieving unholy knighthood, such individuals relentlessly pursue the cause of their rage. Continued failure results in greater frustration and anger and drives the death knight to marshal superior forces. Since time has little meaning to a death knight, it might return for revenge generations after those who wronged it are buried and gone. Success provides a death knight only fleeting happiness, for after achieving its goal, a death knight can only look forward to a cold eternity of endless struggle.

Whatever their personalities in life, death knights become brooding and wrathful in death. They carry their souls in their bony hands, a constant reminder of a bargain that cannot be undone. For power to accomplish a single goal, death knights forego all other joys. That choice weighs upon its every immortal moment.

Newly made death knights and those who regret their decision usually act alone, but with time most death knights accept their status among the undead and use it as a tool for power. Death knights can command lesser undead, and though they

will work with dim-witted creatures such as zombies, most prefer minions that can accept and act upon complex commands. In particular, death knights prefer the services of undead that behave like warriors. Humanoid skeletons, battle wights, and sword wraiths serve them well as foot soldiers, captains, and bodyguards.

Of course, death knights are rarely welcome among the living, and as they gather forces about themselves, they must stay on the move or find refuge lest an army be brought to bear upon them before they are ready for battle. A death knight might take command of a ruined castle, or it might raid and claim a fortress from its inhabitants. If the death knight thirsts for conquest, such conquered territory might become the heart of a dark empire. If the death knight is still marshalling forces or nursing anger about a past defeat, the fortress might remain a haunted ruin, a source of dark rumors and whispered tales.

Although the majority of death knights work alone or as leaders, some become followers to greater forces. Death knights who became undead unwillingly or at the behest of others attach themselves to a superior who shows great purpose and initiative. Sometimes this is another death knight, but it might be a powerful undead such as a lich or vampire, or even a mortal who holds influence over the undead. Death knights might serve another for years or even centuries, but most eventually turn against their erstwhile masters, waiting until they are weak due to some loss. A death knight's loyalty and sense of honor can last far longer than any living person's, but with its soul in hand as eternity stretches out before it, a death knight finds few promises worth keeping and morality a farce.

If a death knight makes any long-term connection with a creature, it is most likely to be with a favored mount. Few horses can stand to carry such a horror, but evil beasts such as nightmares and undead mounts willingly carry a death knight into battle. The teamwork necessary for rider and mount to act as one is often a death knight's only source of lasting pleasure.

MONSTER EVOLUTION

The death knight has been making fearsome appearances in DUNGEONS & DRAGONS games for over 25 years. Since its creation, the concept of the death knight has appeared in novels, role-playing games, and computer games.

MECHANICS

Until 3rd Edition, the death knight changed little from its original form as envisioned by Charles Stross (also the creator of the githyanki) for the original *Fiend Folio*, published in 1981. Stross designed the death knight as an armor-wearing lich with a sword. It could cast eleven different spells, including *wall of ice* at will, a 20d6 *fireball*, and *gate* to bring in demon allies. When

the death knight reappeared in 2nd Edition, it lost the *gate* spell but retained virtually every other aspect of its mechanics. The death knight's translation into a template for 3rd Edition gave the lich some space by removing nearly all the death knight's spells, but it didn't really define the death knight as something other than an undead with a fear aura and 20d6 fiery blast.

In designing the death knight for 4th Edition, we originally developed the concept without including any kind of fiery blast or spellcasting. We wanted the death knight to feel more like an undead knight, so we gave it special weapon and shield abilities, an ability that activates when foes flank it, a special mount power, and a melee-oriented fear ability. Development of the concept stripped away some of the complexity, because the NPC that becomes a death knight should have interesting melee powers just like the NPC turned into a lich should have interesting spellcasting powers. The second design also brought back 3rd Edition's abyssal blast and added undead leadership powers. Yet that version of the monster still didn't feel right. It didn't emphasize melee, and it felt too much like a lich because the death knights employed phylacteries.

The final mechanics for the death knight template are easy to use and reinforce the death knight as a significant melee threat. The melee-oriented abilities augment any capabilities the NPC already has, rather than making a DM choose between using a death knight power or an NPC power. The death knight retains its supernatural nature without having abilities that feel like spells, and it can be a great leader of undead without necessitating undead minions. The new soul weapon concept gives the death knight its own space in mechanics and story, bringing new life to this decades-old undead.

APPEARANCE

The death knight has always been an armored warrior with a fleshless head, changing little in basic appearance since its original Fiend Folio depiction. The most significant change came with 3rd Edition's Monster Manual II. There the death knight clearly had green fleshy forearms and appeared to have similarly colored skin on its face. For 4th Edition's depiction, we returned to the classic appearance of the most famous image of a death knight, Keith Parkinson's Lord Soth's Charge. You can see one result of that effort on the cover of this issue.

FAMOUS DEATH KNIGHTS

The first named death knight was Saint Kargoth, introduced in a 1983 *Dragon* article, but the most famous by far is Lord Soth of the *Dragonlance* campaign setting. Here's a primer on some of the death knights D&D has named over the years.

Saint Kargoth: First introduced in *Dragon* and then adopted by the *Greyhawk* campaign setting, Saint Kargoth was a noble

human knight who, along with thirteen fellow knights, became a death knight after being corrupted by Demogorgon. Kargoth was jealous that another knight was chosen to lead the Great Kingdom's knight protectors, and his fury and envy lead him to seek the power of undeath to pursue his revenge. He became a hero to the worshipers of Hextor, hence his appellation as a saint.

Lord Soth: Like Kargoth, Lord Soth was also a great knight, but Soth's transformation into a death knight is a far more twisted tale. Soth's wife gave birth to a monster that was a representation of Lord Soth's soul. Thinking his wife had been unfaithful, Lord Soth murdered her and his child, even though Lord Soth was himself unfaithful to his wife. When his crime was discovered, Lord Soth was spirited away from his execution by knights loyal to him. While besieged with his knights, Lord Soth was informed that he could save the world from a great cataclysm. He left to pursue the quest that would save the world, but he turned back when told lies about his new wife's fidelity. Soth confronted his new wife and their child while the cataclysm occurred, refusing to save them from a fiery death. The fire that killed them engulfed the whole keep, killing Lord Soth and his allies, but the cursed Lord Soth arose as a death knight and his followers joined him in undeath.

Miltiades: Although not specifically referred to as a death knight, a skeletal undead paladin named Miltiades appears in the FORGOTTEN REALMS campaign setting. Cursed by Tyr, god of justice, after dishonorably slaying a foe, Miltiades sought to do good even after death. Tyr restored Miltiades to life after suitable heroics.

Vanthus Vanderboren: Vanthus featured as a villain in Dungeon magazine's "Savage Tide" adventure path. Appearing as a human foe throughout the first two adventures, he returns as a half-fiend after visiting the Abyss and being transformed by the Flesh Forge. Following his death at the hands of the PCs, Demogorgon turns him into a death knight, and he bedevils the PCs again only to meet a second death. Upon this second failure, he is transformed into a larva, and the PCs meet him in this lowly form during the last adventure.

SAMPLE DEATH KNIGHTS

Death knights can be used in many ways in a D&D game, as minions of a greater foe or as a main villain. As NPCs with an applied template, death knights have any number of options. Below are a few ideas to inspire you when you create a death knight for your game.

King of Brigadoon: The death knight might be the lord of a roaming fortress that appears at certain times in particular places. The death knight and his minions can threaten the PCs wherever they are, and the haunted ruin of the castle can offer an unexpected opportunity for exploration and

adventure. It might be like Brigadoon (<http://en.wikipedia.org/wiki/Brigadoon>), appearing for a time and then vanishing for years, or perhaps it's like the flying citadel of Dragonlance fame (<http://www.geocities.com/~kitiaria/LancePics/ArtOfDL.jpg>). The Ravenloft setting offers obvious possibilities, but if your players are familiar with Lord Soth's time in that land (http://www.amazon.com/Knight-Black-Rose-Ravenloft-Terror/dp/1560761563/ref=pd_bbs_sr_2/102-8602245-6680940?ie=UTF8&s=books&qid=1186605666&srs=8-2), you might want to try something different.

Ring Wraiths: In its initial inception D&D borrowed a lot from J.R.R. Tolkien, so consider borrowing a bit more. The ring wraiths, or Nazgûl (<http://en.wikipedia.org/wiki/Nazgûl>), were kings transformed into undead by the corrupting influence of the rings they wore and the One Ring. However they came about, you can arrive at the awesome image of a half-dozen death knight charging across the landscape. Your dark riders might be a legion of evil seeking to bring their brand of justice to the PCs, or they might be the servants of a more powerful master.

The Headless Horseman: The Headless Horseman from Washington Irving's *The Legend of Sleepy Hollow* (<http://authorsdirectory.com/b/sleep10.htm>) could very well have been a death knight. A dejected death knight might become the unseen menace of an area that the PCs frequent. Based on the PCs' actions in the area, the death knight might gain a purpose and abandon random murders in favor of a more strategic effort against the PCs.

King Haggard: Like King Haggard in Peter S. Beagle's *The Last Unicorn* (http://en.wikipedia.org/wiki/The_Last_Unicorn), a death knight could be the lord of a desolate kingdom that guards something the PCs need. The death knight might even have mortal servants who are not evil but serve out of a sense of loyalty to the former living knight. Dealing with this minion of evil without unduly harming his misguided followers could present an interesting challenge to players.

The Black Knight: A death knight ably fills the role of a stereotypical Black Knight (http://en.wikipedia.org/wiki/Black_Knight_%28disambiguation%29).

This works best if you disguise the death knight's status as an undead warrior, and the death knight works as an ally of the PCs for a time. Like some of the black knights of literature and legend, the death knight might follow a strict code of honor despite his villainous nature.

Genghis Khan: If you really want the death knight to make an impact on your players, put it at the head of an undead army. Your death knight might be like Genghis Kahn (http://en.wikipedia.org/wiki/Genghis_Khan), gathering warriors of the conquered nations into its army as it moves. These warriors might be the dead of the conquered, risen as undead warriors, or even living warriors who believe that serving the death knight offers a better chance of survival than opposing it.

Blackrazor: The adventure *White Plume Mountain* (http://en.wikipedia.org/wiki/White_Plume_Mountain) introduced Blackrazor, a magic sword that stole a character's soul and made him subject to its whims. In your game, you might use Blackrazor or invent a different magic weapon that steals its wielder's soul and transforms the person into a death knight. The magic weapon might be the true villain, with the death knight as its hapless pawn.

Lancelot and Guinevere: Consider pairing your death knight with an evil partner. Perhaps your death knight is a version of Lancelot who has fallen for an evil Guinevere (<http://www.sir-lancelot.co.uk/Guinevere-Lancelot.htm>), or your Guinevere might be the death knight and Lancelot an evil lord. One might be a vampire or demon who leeches off of the unrequited love of the other. In a dark turn on the Arthurian legend, Guinevere is secretly a vampire or succubus who preys upon the enthralled king while her dark knight Lancelot does her bidding, turning the shining kingdom into a growing blight of darkness and despair.

The Death Knight

Inject a little life into your campaign

by Ed Stark

Artwork by Robert Klasnich

"As you force the door to the tomb open, dust and cobwebs blow into your faces—"

"I hold up my cloak to ward it off!"

"I hold my breath!"

"I turn away and close my eyes!"

"Okay, okay. The dust and cobwebs don't hurt you, and the stale air from inside the tomb starts to dissipate. You push the door inward, slowly but firmly, and its ancient hinges groan —"

"I pull out some oil and splash it on the hinges!"

"I ready my crossbow! I'm also ready to throw a torch in the room!"

"Remember — we're not stepping inside the door! We're pushing it open from outside!"

"Fine. The door's open. Inside, you see dust and cobwebs covering two large mounds. Gold and silver, only partially covered by the dust, peek out through the cracks in the cobwebs. There appears to be a body lying on top of each of the piles—"

"I'm throwing some oil on the nearest pile!"

"My torch follows it, buddy! Oh, and I've still got my crossbow ready!"

"I pull out my holy symbol and peek out between the two fighters!"

"Good. Fine. The oil splashes on both piles, and the cobwebs catch fire easily. Old garments and death shrouds burn away, and you see gold and silver underneath. You also see the bodies of two large warriors, covered in ancient armor and clutching mighty swords. They are skeletal—any remnants of flesh left on their bones has been burned a way."

"All right—undead!"

"I put away my crossbow—it's no good versus skeletons."

"Hah! Don't worry about these skeletons, boys—I'm 4th level! They're going bye-bye as they start to move!"

"Right. And move they do. The body on the right stands up clutching a two-handed sword. It swings it once, as if to make ready, while the other pulls a morning star and a shield out from under its feet. Both are moving fluidly, as they were once practiced warriors."

"Yeah, yeah. C'mon, let's start counting the gold."

"Do I see anything that looks magical?"

"I hold up my holy symbol."

"Begone, foul creatures! Back to the sleep of death!"

"Nice. They don't seem impressed."

In fact, they seem so unimpressed that one strides forward and points at the fighter looking over its pile of gold. The other one doesn't seem nearly as dramatic—it steps forward and takes a swing at the thief."

"Wait a minute! I thought you said these were skeletons!"

"Yeah! What do you mean it swings at me? Skeletons are slow! I'd have plenty of time—"

"Hold it! I turn skeletons automatically at 4th level! These can't be—"

Silence.

"Death knights! Aaaah!"

Are you up to your armpits in nameless undead? Are low-level encounters with the spawns of evil becoming predictable and tiresome? If you hear one more player joke "Brains, we want brains..." when your supposedly horrific necromantic creations shamle forth to do battle, are you going to scream?

Well, then, inject a little *death* into your campaign.

A death knight, to be specific.

The Death Knight as NPC

Originally found only on the world of Krynn, death knights pervade the planes and worlds of the AD&D® game like, well, undead warriors out for blood. They do battle with the forces of good and evil alike, pursuing their nightmarish destinies

on their own terms. They make your game a little more interesting in the process.

The NPC death knight described in this article is based on the "Death Knight" entry in the *MONSTROUS MANUAL™* tome for the AD&D game. That book features the "basic" death knight—a powerful, interesting adversary for the heroes in its own right, and a good place to start with this terrifying new NPC class.

Creating the Death Knight

All death knights were once proud and able warriors, and their statistics reflect this. Even the most inexperienced death knight must have had *some* ability before it died, or it would not have been made a death knight in the first place. Incompetence is not the same as true evil, after all (though it may sometimes seem like it).

As a result, death knights seldom have *any* ability scores below 10. The following chart shows how to determine a death knight's basic abilities.

Characteristic	Die Roll
Strength	18+d100*
Constitution	14+1d4
Dexterity	12+1d6
Intelligence	8+1d10
Wisdom	8+1d10
Charisma	10+1d8**

* The death knight's Strength may improve (see below).

** Living beings may or may not find the death knight horrific in appearance, but there is no denying its presence or power of command.

All death knights are evil in alignment. Almost all are chaotic evil, but a few (10%) are able to resist the chaotic pull of undeath and stay either lawful (30%) or neutral (70%) evil.

Death knight NPCs seldom start out at 1st level. Whatever evil force creates them usually "rewards" them with power to reflect the evil might they had in life. And, because the death knight is an intelligent and fairly independent creature, it can advance in level after its creation.

Death knights use the same XP table as rangers and paladins, roll ten-sided dice for hit points, and have the same rules for proficiencies and weapon specialization as warriors. Their THAC0s are the same as for warriors of their level, though many death knights specialize in their chosen weapons and, therefore, gain certain bonuses.

Death knights make saving throws as either warriors or priests, whichever save is better. They have no level limits, though

death knights over 9th level are extremely rare (thank goodness!).

Unlife Abilities

The evil that creates and motivates a death knight rewards its servant with certain special abilities. All death knights have the following characteristics:

- When a death knight performs an act of pure, unmitigated, imaginative evil (like corrupting a lawful good character and convincing him to take evil actions), it gains +10% to its Strength. But with each such act, it becomes more and more difficult for the death knight to gain another bonus. Thus, death knights with high Strength bonuses are extremely inventive in their evil. The Strength incentive inspires them to new lows in evil. (There are rumors that some death knights, by achieving acts of unspeakable horror and depravity, have actually advanced their undead Strength *beyond* the 18/00 limit and up to 19 or 20.)

- Unlike most other undead, death knights cannot be turned by a priest of any mythos or level. Death knights can be dispelled by a *holy word* spell, however, and this one weakness makes them hate and fear all good priests.

- Each death knight gains a magic resistance equal to 30% plus 5% per level of experience. A 4th-level death knight has a 50% magic resistance, while a 9th-level death knight resists magic at 75%. However, no death knight may have a magic resistance higher than 95%.

- All death knights involuntarily radiate *fear* in a 5' radius. This sometimes makes their dealings with the living much more interesting.

- Death knights can use any magical items not prohibited to fighters. Some death knights (who were multi- or dual-classed in life but lost those abilities in undeath) can use wizard (10%) or priest (15%) items as well. No death knight can use a potion or item that must be ingested, since it has no natural bodily functions and cannot eat, drink, or breathe, even if it desired.

- The force of evil that creates a death knight often provides it with magical weapons, armor, and other equipment it can use in the fight against good. The most basic magical item a death knight usually has is a magical sword or other weapon.

- Every death knight has a 10% chance per level of gaining a roll on the table below. For example, if you create a 5th-level death knight, check five times to see if it gains a magical weapon; once at 10%, then 20%, 30%, 40%, and finally 50% to reflect the five opportunities the knight has to gain such a weapon. Swords are listed, but feel free to substitute other weapons with corresponding powers.

- A death knight's magical weapon is not acquired in the manner of other such items. The weapon is usually placed where the death knight will find it only if he commits a terrible, evil act. Once the death

knight has rolled successfully for a special weapon, he can never roll again on the following table, even if he loses his weapon.

Roll	Death Knight's Weapon
1	Long sword +2
2	Two-handed sword +3
3	Two-handed sword +4
4	Short sword of quickness
5	Short sword of dancing
6	Short sword of life stealing

Experience Before and After Death

As mentioned above, living warriors who become death knights retain some of their experience and abilities, depending on how evil they were in life and how terrible the force of evil is that creates them. For example, Lord Soth, the most famous (if not most powerful) death knight of all, murdered his wife so that he could continue an affair with an elf maid. The fact that Lord Soth was supposedly an honorable Knight of Solamnia made this an even more terrible crime, and it "earned" him great power at the beginning of his death knight "career."

It is unlikely that any force of evil, no matter how weak or powerful, would create a death knight at less than 4th level—except as an extraordinary punishment for a warrior who once fought against evil but finally succumbed. Begin your death knight NPC at the lowest experience total possible for the level desired, and let it progress using the ranger/paladin XP chart in the *Player's Handbook*.

Remember, death knights use the same rules for proficiencies and specialization as living warriors, so determine their abilities along those lines.

As do some living characters, death knights earn more abilities as they achieve higher levels of experience:

- At **4th level**, a death knight radiates *fear* in a 5' radius, and it can cast *detect magic* and *detect invisibility* at will.

- At **5th level**, it can cast *dispel magic* twice per day.

- At **6th level**, it can cast *wall of ice* at will.

- At **7th level**, it can cast one of the following spells, once per day: *power word stun*, *power word kill*, or *power word blind*.

- At **8th level**, it can cast *symbol of fear* and *symbol of pain* once per day.

- At **9th level**, it can cast *fireball* once per day.

All of the death knight's magical spells function at twice its own level of ability, to a maximum of 20th level. For example, a 2nd-level death knight casts spells as a 4th-level caster.

Companions of Evil

Upon achieving 9th level, a death knight becomes an extraordinary force of evil in its own right. It begins to radiate dread

and undeath wherever it goes, and other undead sense and seek out the source of the evil. The death knight attracts undead followers and allies that it can use to hatch and execute its schemes.

Undead Followers

The followers of the death knight include skeletons, zombies, ghouls, ghosts, wights, and other low-intelligence undead that may be wandering around the DM's chosen world. These creatures feel the evil in the death knight and rise from their resting places, wandering by twilight and darkness toward the death knight's abode, knowing only that they must serve a power greater and more evil than their own.

For every month that a death knight spends in a particular area, it attracts 1d20 undead followers of this type. Many death knights actually loathe these followers and either assign them menial or pointless tasks (like digging a hole through the earth or carrying water from the sea to an adjoining river) to get them out of the way, or send them on suicide missions against more powerful foes—like walled towns or armed citadels. The undead respond without question and obey the death knight; that's all they can contemplate doing.

But some death knights use their followers to set up a gruesome parody of a living court. Inside a death knight's castle, zombies and skeletons act as pre-programmed servitors, jugglers, and ghastly courtiers, playing out roles the death knight sets for them. They act out plays, fight duels, and guard the walls, all as if they were living, breathing men and women in a high court of the land.

The most common use a death knight has for its undead followers is to disturb the living. The death knight uses its minions to raid villages, carry off the living, and wipe out caravans. The death knight has no concern for its own losses—more undead find it every month. It is fortunate that the chaotic nature of most death knights makes them feel this way; if they merely waited a few months or years, they could build unstoppable armies of the dead.

Undead followers who must normally check morale do not do so when following a death knight. Perhaps this is because the death knight is such a charismatic leader, or, more likely, it is because the undead innately fear the wrath of the death knight more than any other possible fate.

Undead Allies

Once per month the death knight has a chance to attract a powerful undead ally such as a lich, vampire, skeleton warrior, or other creature. This chance is equal to 5% per level of the death knight. The ally arrives at the death knight's lair as a possible servitor, master, or partner in evil, depending on the death knight's power and prestige.

For example, a newly arrived death knight could attract a powerful lich that

would attempt to subvert it and force the death knight to do its will, resulting in a battle between the two creatures. Most likely, however, the force of evil that controls the death knight keeps the two from becoming deadly enemies, and they work together (at least at first) to plague the living. Once a death knight has attracted an undead ally, it will not attract another until the first has departed or been destroyed. It continues to attract undead followers, however.

The Lair of the Death Knight

Death knights can and do exist anywhere. They usually try to make their abode in undeath mimic the abode they had, or wanted to have, in life-if they do not still possess that lair, that is. But a death knight's strange nature wars with its desires, and the holding becomes a house of horror soon enough.

All death knights "remember" being great warriors and, possibly, lords in life. They seldom build castles or palaces, but they are happy to take them over after putting their occupants to the sword. On rare occasions, death knights construct their own castles, and these tend to be horrors of impossible architecture and torture, maintained only by the evil will of the death knight and the efforts of its undead followers.

The interior of a death knight's lair smacks of incongruity. All the floors and furnishings in a given room may be old and covered in dust and cobwebs-except for a vase full of fresh, red roses that seem to thrive in the dark, dank atmosphere. Or a wall might be covered by moth-eaten tapestries, majestic, sad banners from battles long lost or won-and the freshly killed body of a cleric, pinned to the wall with a spike through his chest. Something old, something new, something bloody, something blue-death knights lead the undead with their "fashion statements."

As a result of this strange life-and-death juxtaposition, hirelings and henchmen (and other NPCs) who venture into a death knight's lair automatically lose two ranks from their morale. The bizarre horror and twisting terror of the lair strike fear into even the bravest and most loyal souls.

Building the Death Knight

Begin with the living character. Who was he (or she)? What order of honor and goodness did he serve? What heroic deeds made his later fall so tragic and his betrayal so complete? How has he made himself so infamous since becoming undead? The following is an example of a death knight you can use to make your world darker and more deadly

Lady Jane Restfield, a.k.a. "Bloody Jane the Damned"

Lady Jane Restfield once served the forces of order and goodness with bright steel and an even brighter soul. A paladin, she fought to keep evil at bay and bring goodness and fair play to all the corners of her world. She numbered among the Twelve Knights of the Golden Realm, and she was chief in their order when darkness fell.

It began with an attack on her family. It was not a physical attack, oh, no-Lady Jane and the Restfields could handle any battle an enemy brought to them. Two of the three Restfield sisters (Lady Jane included) had distinguished themselves at the Battle of Broken Lances, and Jane's third sister, Antonia, was a wizardess without peer.

The attack was slander. First, Antonia was accused of dabbling in dark magic and forbidden lore. The family's own investigators, employed to clear the young woman's name, found evil tomes hidden among her belongings. Though Antonia swore she'd never seen or used them before, doubt began to grow.

Then Lady Jane's second sister was killed. That would not be dishonorable, but her body was found in a tavern of ill repute, a knife in her back and a tankard in her hand. Though her own retainers swore that she'd been nowhere near the tavern that night and that they'd never seen her drink a drop of ale in her life, the body (and the evidence) was plain.

Amidst all the scandal, Lady Jane strove to distinguish herself and shield her family. She became more aggressive in battle and won the nearly impossible Siege of Hightower almost single-handed. But when rumors of bribery and dishonorable battle practices shrouded even that victory in shadow, Jane found herself in despair.

No one knows what pushed Jane over the edge. Perhaps it was her mother's apparent suicide, or Antonia's lapse into madness. Whatever the cause, one day Lady Jane killed an entire audience of courtiers who had come to demand her presence at a trial of honor, and she rode off into the night.

The next time anyone saw "Bloody Lady Jane," she had changed dramatically. Her skin, once white and clear, was now bleached and gaunt to the bone. Her eyes were hollow and her beautiful, raven tresses were gray and brittle. She was undead.

Lady Jane the Damned, as the people of the Golden Realm call her, rode down on the estate of her birth with an army of undead. She slew the groundskeepers and those of her distant family who still inhabited the place, and she butchered all who came to fight her off. Now she holds court in that villa of the damned, content to sing of her terrible betrayal and expedition into unlife only so long as no one approaches her gates. If anyone ventures onto the lands of Bloody Lady Jane, they are never seen again . . . *Alive.*

Adventure Suggestions

Death knights come from anywhere and can go anywhere. Though they tend to be territorial, inhabiting places that remind them of their previous lives, a few wander the land almost like revenants, seeking some lost meaning for their undead lives.

Most death knights are not motivated by a hatred for the living but by a loathing for their own horrible existence. While no death knight would ever succumb to destruction voluntarily, they resent all those who have and cherish life, since they, at some point, despaired and embraced evil and unlife (consciously or not).

As a result, death knights exist to torment the living and sorely test the valorous. They desire to prove that they made the only choice possible to them during their lives by continually corrupting the good and noble and bringing them down to their level of evil. A death knight that succeeds in corrupting a truly good individual does not experience bliss or triumph, however. Something in its makeup forces it to loathe even *that* victory, and the death knight usually destroys anyone who succumbs to its evil.

Death knight adventures should be centered around cleverly woven traps and hard choices. For example, it would be characteristic for a death knight to kidnap the entire family of a good character and threaten to torture and kill those innocents, while at the same time sending its undead legions and allies against a village the PC has sworn to protect. The PC has time to save only one group, his family or the village-which will it be? If the death knight has its way, the PC's choice is always the wrong one.

Sometimes, death knights hatch even less straightforward schemes. Kidnapping and torture are always good motivations, and the death knight seems to have an uncanny ability to manipulate PCs into doing what it wishes. It might kidnap a loved one or loyal retainer and force the PC to "prove" his valor by fighting monsters, performing quests, and eventually choosing between good (and the death of his loved one) or evil (and the loved one's survival).

A Final Word

Though this article must end, there is no end to the usefulness of the death knight as an NPC villain. The death knight begins as a tragic character that the PCs might actually feel sorry for (make certain they know or learn of its history), but it becomes a terrifying evil that must not be allowed to roam free.

What's more, the death knight is not just a villain: It is a *promise*. PCs who ignore their alignments, break their vows, or make "the hard choices" too easily and without conscience can look at a death knight and wonder: How far away from that am I?

Ecology of the DERRO

Behold their
glorious
madness!

By Wolfgang Baur

The net fell without a sound, and the svirfneblin caught under it struggled for a moment, screaming, then fell silent. A steady rain of blue tears fell from one eye, but the three spike-haired creatures surrounding the net showed no sign of sympathy. "Are there more of them?" said one.

"I don't see them. This one is enough." The derro pulled at the net to tighten it just as an acid-filled dart flew by. It struck the captive, who twitched and lay still. "Bastard! Find him!" roared the derro, veins bulging against his pale skin. "They must learn despair!" His voice echoed from the cavern walls. The others scattered to obey.

The hidden svirfneblin saved his companion from a slow, lingering death. It was all he could do.

The derro are the only permanently insane species to live in the underdark. Ropers, scourges, aboleth, and the various aberrations are alien but not insane; their thoughts are ordered, if entirely foreign. The fishfolk are prone to insanity but not all of them suffer its lash. Even the endless despair of driders and the insatiable hunger of the ghouls are understandable, powerful versions of normal feelings.

The derro are different. They survive not in spite of but because of their particularly passionate embrace of madness, and they thrive on it. Saner species fear the strange little dwarves because they seem to believe themselves subject only to forces no one else can see. Each derro believes that he and his race are the masters of the underdark. Other races

believe that this is part of their megalomania; derro believe their superiority is just a fact, and act accordingly, as if they already ruled the underworld.

History of the Derro

In the dark caverns where the River Styx presses close to the surface world, time rolls slowly and history is an illusion. Without day and night, without seasons, time passes marked only by the cycles of sleep, birth, and death. Entire species slip into the worship of dark gods, into the contemplation of the dark and empty voids around them, and despair. This is what happened to the derro.

Long ago, the derro were the bastard offspring of humans and dwarves, no more loved than half-elves are, but toler-

ated by human society. Dwarven society shunned them as abominations and pushed them down into the darkness. Most perished quickly; they were eaten by ghouls, gobbled by purple worms, or they simply starved to death. The drow, aboleth, and duergar enslaved the survivors. They became a distinct dwarven race, scarred by their servitude.

Over centuries, the derro's resentment of their pitiful lot led them to the worship the ancient elemental gods and to enter into pacts with demon lords of madness and revenge. Among the drow, this distasteful gutter cultism was not considered especially dangerous, or even terribly unusual. They treated the derro as favored idiot children, too foolish to worship a proper demon goddess like their own.

Among the aboleth, they were treated with pride as proper acolytes of gods behind most creatures understanding. The duergar simply worked them until they died in place.

The derro slowly grew in numbers and found a place as bullies, slave overseers, and torturers. Each year a few gave in to their deviant appetites and were slain if they raised a hand against their masters. Over the years, the underdark races came to view that as “just the way derro are.” Even the madly violent ones were allowed to live.

Gradually, the derro turned from madness as a refuge from pain, to madness as a source of strength. Legends tell that some escaped from their masters and built a small settlement of their own, where their madness resonated more strongly the more of them gathered. The strength and skill they had learned from the duergar, the forbidden lore they had taken from the aboleths, and the tolerance for bitter suffering they had learned from the drow all came together as they toiled to create a metamagical planar resonating device called “the ship of night”, a piece of engineering combining dwarvish craft, stolen aboleth lore, and the evil of drow.

Through the use of its projectors and lenses, the derro called forth their gods, creatures from beyond the veil, and took a terrible vengeance on their former masters. Then, legends say, the gods retreated from the world. The derro vengeance was complete, but their gods had abandoned them in the cold and dark. The gods gave the derro freedom from slavery in exchange for this summoning, at the price of their minds. No derro was ever sane again.

Ever since, the derro have followed a path of cult frenzies, slaughters and slow torture to please their demon gods, to bring them back, to show themselves worthy of the rulership of the underdark, their destiny and gift. Torture and madness and despair are the derro’s pleading worship.

Other races don’t fear the derro because of their military or arcane power. They fear that the derro madness hold

deep and forbidden truths, knowledge that destroys other races outright. They fear that the derro gods might come back and teach their mad little servants new tricks. Certainly derro seem able to draw on reserves of strength and strange arcane lore that other races lack.

Derro Knowledge and Craft

Derro are famous for their knowledge of secret lore, their poisons, and their mastery of many underdark elements and resources that others do not care to discover, such as the proper care of oozes or the divinations to be read from thooqua entrails. The wisest savants often have ranks in a wide range of disparate skills, from Knowledge (Dungeoneering) to Craft (Stone), Profession (Worm Farmer), and Knowledge (Arcane). If you use Knowledge (Forbidden Lore) in your game, all derro savants have at least 3 ranks in that skill.

The body of derro knowledge does not come from books or scrolls. Instead, half of it is imparted to those who become the derro savants by the tearing of the veil, and the other half is learned through oral repetition. Some claim that the derro wisdom comes from creatures beyond the veil who speak to the derro; indeed, careful listening does reveal that savants often mutter to themselves for days and hours at a time, with pauses in their conversations as if something were answering them. No one else hears the answers given, and this condition is usu-

ally ascribed to their insanity.

Derro Anatomy and Appearance

Derro are short, stocky creatures with flat white eyes and spiky hair often glued into spikes using bat guano; this gives them both a strangely wild appearance and a peculiar smell. Many adult derro have cataracts that should completely obscure their vision, yet their milky eyes can see.

Derro insanity is the defining feature of the race, but it is not present at birth. Derro children are all clear-eyed and normal, but they are scarred and driven insane by their parents quite deliberately, usually at the age of 4, when their speech and motion are fully-formed. The ritual used goes by many names, again as a matter of preference from tribe to tribe and even year to year; sometimes they call it Staring into the Abyss, sometimes it is the Heartless Fire or the First Drink of True Knowledge.

In every case, the derro child is led away from the tribe into darkness and given a potion brewed by the group’s leader from centipede venom and hallucinogenic fungi. The result is vomiting and visions, and in many cases the end of the derro child’s life: roughly one in twelve is “taken by the gods”. The derro do not mourn these losses; they consider them a blessing by the gods of madness on the child, and the parents comfort themselves with the knowledge that their child is spared a long life of struggle and want.

Knowledge of the Derro

Characters with ranks in Knowledge (Nature) can learn more about the derro. When a character makes a successful skill check, reveal the following lore, including the information from lower DCs.

Table: Derro Lore

DC Result

10 Derro are monstrous humanoids, the warped crossbreeds of human and dwarf, who live below the earth.

14 Derro worship gods of madness and despair, and yet they are powerful sorcerers and clever fighters. They often use poisoned weapons and magic to trap victims for ritual torture.

18 Derro are insane, prone to terrible rages and unprovoked violence. They use repeating crossbows, nets, and spells to catch their victims.

22 Derro are easily swayed by power; Bluffs work well against them, and they adopt new leaders and new gods frequently. They use incantation magic.

Their madness makes attempts to get information from them simply by asking suspect. They often wander into complex delusional fantasies of personal power and megalomaniacal tirades of the injustices visited on them and their clan by outside forces.

Derro are short-lived, perhaps because of the filth and madness that they consider normal. Few reach the age of 40, considered the mark of decrepitude and the blessings of elder gods by the derro. Persistent tale that derro elders are sacrificed in powerful blood rituals have never been confirmed.

Derro Magic

Derro magic is most common among the savants, their cultish sorcerers, wizards, diabolists, and warlocks. Many if not most of them follow schools of divination, elementalism, illusion, clockwork magic, and evocation; relatively few are transmuters, necromancers, star and shadow mages, or enchanters.

Most derro understand at least a few incantations and can chant them with a leader to generate form of group magic. These incantations include Parting the Veil, Scuttling Wisdom, The Black Road, and Calling Forth the Dweller.

Parting the Veil

Enchantment

Effective Level: 4th

Skill Check: Knowledge (Forbidden Lore or Arcana) DC 20, 5 successes

Failure: Death

Components: V, S, M, F, XP

Casting Time: 60 minutes

Range: Touch

Target: One creature

Duration: Instantaneous

Saving Throw: Will (special)

Spell Resistance: No

This incantation open a channel between the mind of the caster, the mind of the target, and powerful, semi-divine extra-planar entities who reveal a momentary glimpse of the dimensions normally invisible to corporeal creatures of the material plane. As a result, the target's eyes turn milky white, and the

affected creature gains 1 rank in Knowledge (Forbidden Lore) – if it doesn't die of the shock.

To part the veil, the caster uses both symbols drawn on the target's face and eyelids, as well as chants and supplications to the elder elemental gods and the derro Mother of Madness.

If the incantation succeeds, the target learns to see normally through multiple dimensions and becomes an adult derro, doomed to both madness and secret knowledge.

Failure: If the caster fails two consecutive Knowledge (Forbidden Lore) checks, the Parting of the Veil adds one to the caster's ranks in Forbidden Lore and reveals far too much to the target. The target must make an immediate Will save in the face of this knowledge or die, their brain unable to correlate this alien knowledge with their own.

Material Component: Using a paste of bat dung, derro savant blood, and rare, fluorescent minerals, the caster inscribes lines and spirals around the eyes of the target.

Focus: An open grave, a cavern filled with centipedes, and other memento mori are used to bring the target close to the veil between planes.

XP Component: 200 XP.

Backlash: After Parting the Veil, the caster is fatigued.

Campaign Use: This incantation is purely a tool to reveal starry wisdom to the derro children and ensure their eventual insanity. However, the derro are ecumenical in their madness, and will gladly offer to share their wisdom with anyone who professes any interest in learning it.

Derro Equipment

Derro gear is rarely well-kept, but some of it is surprisingly well-made and inventive.

Clothing and Armor: Derro wear good armor and clothes, but care for them sporadically. The strangest garment common among the derro is their love of bone-inlaid helmets with openings for hair, ears, and eyes. The eye and ear openings make sense from a practi-

cal point of view, but the derro insist that their hair must also have a way to reach the air (and thus create a point of vulnerability) for their leader's voices to reach them.

Derro studded leather armor is often dyed and decorated much more elaborately than most: some suits are simply black with white spots, others have swirls in shades of brown, black, and grey.

Cave Dragonscale Shields: These size Small masterwork dragonscale shields weigh 4 lbs, provide a +2 bonus to Armor Class, have a 10% arcane failure chance, and grant a -1 armor check penalty. Only derro seem to make them; gluing cave dragon scales to a heavy metal frame requires a special technique. They sell for 250 gp or more when they are available.

Messenger Bats: Some derro have a strange affinity for small cave creatures, typically bats (though sometimes also cave scorpions, rats, or centipedes). Their trained messenger bats do go where they are told, and carry small messages in tiny scroll cases attached to their hind legs. Because they resemble all other cave bats, they are usually a safe way to transmit messages quickly; the bats cover 32 miles per 8 hours flying. Messenger bats usually sell for 25 gp.

Poison Net: The derro have learned how to weave a complex type of netting using a combination of monstrous spider silk and fibres from a dried mushroom they. They coat these nets with contact poison such as weeping poison or dragon bile (Fort DC 26, Initial 3d6 Str, Secondary 0, 1,500 gp), and use it to make it easier to capture living victims for ritual torture and sacrifice to their dark gods. Any creature caught in a poison net must make a poison saving throw during each attempt to escape the net. Creatures that help a victim out of such a net must make also make such a saving throw. The poison net is almost identical to a normal net, weighing slightly less (5 lbs) because of its construction. They are never sold to outsiders.

Weeping Poison: Brewed from a com-

bination of mineral toxin and vermin venom, derro bluetear or weeping poison is a powerful injected poison that is made only by derro elders and alchemists. It is named for the copious tears that its paralyzed victims shed, both when they are captured and when the derro begin their vile tortures. The poison is Fort DC 17, Initial 2 Dex, Secondary 1d6+3 Dex and paralysis, 750 gp.

Society of the Derro

Derro society is a place of extreme violence and free-form dictatorship; they recognize no law but the law of brute strength and power, and they often fall victim to leadership cults, wherein a particularly powerful derro (or just as often, a powerful outsider, undead, dragon, or other creature) becomes the undisputed and frequently worshipped leader of the clan.

The non-derro leaders include cave dragons, undead such as liches or powerful ghouls, and demons of various stripes. In every case, the derro submit entirely and unthinkingly to their new overlords until the day they turn on them and attempt to tear them apart: that day is usually the first day that the new overlord disappoints the derro, failing to provide food, victims to torture, or other forms of entertainment.

Derro and Cave Dragons: Both the derro and cave dragons love darkness and blind-fighting, and the two get along well, as long as the derro show themselves as submissive, fawning, and generally obsequious creatures — which they are usually quite willing to do. They frequently form alliances, with derro providing information and support to a cave dragon in exchange for dragon bile poison and cave dragon scales.

Derro and Drow: Derro serve as torturers and bullies to the drow, flaying, crushing, and breaking those whom the drow themselves do not wish to bother with (or those who they fear to destroy, if they are taking political or religious risks). Drow treat derro are mildly retarded, violent imbeciles, and kill any

so bold as to raise a hand to a female drow priestess or a powerful noble. What derro benefit because they gain the opportunity to torture many prisoners and they take payments in cash and foodstuffs. Derro also enjoy drow fungal wines, which they are too impatient or too demented to brew themselves.

Derro and Ghouls: Derro are foolish enough to sometimes follow the powerful darakhul ghouls who promise eternal life. The ghouls rarely make derro into ghouls, because their madness continues as undead, but the two do co-exist fairly well.

Cults and Religion

The derro worship a ridiculous number of minor, piddling gods, who can best be described as bitter and meddling — because none of them except Mother Madness retain the derros' attention for long. Most of these gods are evil and all of them chaotic and deeply insane. These derro cults are constantly changes; in the past, they have worshipped the Goddess of Night and Magic, elder elemental gods of the deep underdark, and the Demon Eater, as well as goddesses of redemptive suffering, bat gods, and great worm gods.

Perhaps because of their shallow, flitting piety, few derro have much of a connection with the divine; their religious passions are powerful but shallow, and they change their minds about gods as quickly as they do about leaders. Each season brings a new twisted god to their altars, and the old one is shoved aside at the least sign of failing to heed the derros' wishes.

Bandegreb, the Torture God

Bandegreb love inflicting pain, relishing the abuse of his power against the weak and helpless. His evil is complete; he hides his misdeeds under cloaks of darkness, but derro always attribute any strange echoes and screams in the underdark to "Bandegreb finding a new victim." Worship consists entirely of finding and torturing living things; everything else is secondary.

Domains: Chaos, Darkness, Destruction,

Evil

Addrikah, the Mother of Madness

Addrikah is a strange elderly derro who babbles constantly; her voice is said to "spill wisdom", but her hymns are nonsense and her voice seems to hear only itself. She is revered as the derro savior, who saved all derro from slavery through the gift of madness. She is also the derro's connection to much more alien gods, as an oracle and interpreter, but to other races she seems completely cracked.

Despite her age, Addrikah is said to crush skulls with her tiny hands, sucking out the juices within and then somehow transforming brain matter into gemstones and ioun stones. Her worship and legends are disjointed, even by derro standards.

Domains: Chaos, Evil, Madness, Strength

Tikalekka, the Lord of Vermin

The god of centipedes, spiders, cave crickets, and all things verminous resembles a mass of chitinous fibers held together by swarms of beetles and roaches. The mass has poisonous fangs, a variable number of limbs, and complex mandibles rather than hands. His voice is the buzz of decay.

Poison, nets, and the Black Road are all his domain, and he is a powerful trickster. He is also completely insane, but (in derro legend at least) he is not evil, merely concerned for the safety of his followers, who are scorned by all living things.

Domains: Animal, Earth, Madness, Trickery

Derro Tactics and Combat

In combat, derro make little use of the Black Road and other incantations; instead, they rely on the information they gain from the elder gods to craft their battle strategy and they make heavy use of false retreats. In this tactic, after a quick exchange of blows they fall back in a "panic" toward a prepared area that has already been rigged with poisoned nets or a crossfire of poisoned bolts.

***This fall...
the fey bare their teeth in***

***The Faerie Ring:
Under a Poison Moon***

www.zombieskypress.com

There they suddenly turn to make their stand, capturing as many foes alive as they can.

In larger fights when they need to seize and hold an objective, they often use their understanding of vermin and animal handling skills to capture and train the largest carrion beetle they can find. They use this beast as a fighting platform for overrunning positions, and they use their acid to melt the doors or obstacles that would otherwise require powerful magic or siege engines.

Derro Traits: As a small size humanoid, Ulthor gains a +4 racial bonus to Hide and Move Silently.

Sneak Attack (Ex): Any time Ulthor's opponent is denied his Dexterity bonus to AC, or if a he flanks his opponent, he deals an extra d6 points of damage.

Vulnerability to Sunlight (Ex): Ulthor takes 1 point of Con damage for every hour he is exposed to sunlight, and he dies if his Con score reaches 0. Lost Con points are recovered at the rate of 1 per every 24-hour period spent underground or otherwise sheltered from the sun.

Madness (Ex): Ulthor uses his Charisma modifier on Will saves instead of his Wisdom modifier, and immunity to confusion and insanity effects. Ulthor cannot be restored to sanity by any means short of a *miracle* or *wish* spell.

Chapter One

DERRO

SUNDAY, ROVA 20TH, 4709 AR—PATIENT 23 CONTINUES TO BELIEVE THE FATHER OF HER UNBORN CHILD IS A DEMON. LAST EVENING'S ADDITIONAL EXAMS DID INDEED PRODUCE SCARRING EVIDENCE ALONG THE LOWER ABDOMEN, AND RECENT DAMAGE TO THE BACK OF THE HEAD NEAR THE BASE OF THE LEFT EAR. SHE REFUSES TO SLEEP AT NIGHT, COMPLAINS OF "THE EMPTY MOON EYES THAT WATCH" AND "THE BLUE PIT TO HELL." SHE PANICS WHENEVER SHE IS BROUGHT DOWN TO THE BASEMENTS, AS IF SHE FEARS THE VERY PROXIMITY OF THE GROUND. THIS EVENING I SHALL VENTURE TO THE DISTRICT IN WHICH SHE WAS FOUND, BLOODY AND AMNESIC, AND ASK AROUND. IF I CAN FIND EVIDENCE OF THIS "BLUE PIT TO HELL," PERHAPS I WILL FIND MORE CLUES AS TO THE FRIGHTFUL MYSTERY THAT PUT HER IN MY CARE.

—FROM THE NOTES OF MISSING EGORIAN ALIENIST, AVAKAR SIVANCHI

It is something of an irony that civilization, a result of a society's reaction to the perils and dangers of living in the wild, brings with it new dangers of its own. The concentration of life in such relatively small locations as one finds in the world's towns and cities magnifies many perils present to a lesser degree in lower populations. A single fire that might burn down a house in the rural parts of the world can spread and wipe out an entire district. A sickness that could devastate a family of farmers on a frontier can lance through a tightly packed population with frightening speed. A deadly predator that picks as its hunting grounds an acre of land will find much more to sate its appetite in a city's slum ward than it would along a lonely moor road. And when that predator is a master at hiding, stalking, and snatching its prey, and has developed exacting methods of covering the traces of its presence, a city becomes not a bulwark against disaster but the very catalyst for despair.

Every city is haunted by missing souls—citizens who simply vanish on the way home from a day's work or while out on a mundane errand. Some are lost forever. Others are returned, alive or dead, their bodies and minds changed from their experiences while abducted. And it seems that for every missing person case that reaches a satisfying (if sometimes tragic) conclusion, two more remain forever mysteries without solutions. What then of society's morale should it be learned that, in a horrifying preponderance, the causes of these unexplained vanishings and abductions stem from the same sinister source?

Cities cast shadows into the depths of the earth as surely as their buildings drape alleys in darkness on the brightest day. In the world below, strange creatures dwell and listen and lurk, the perpetrators of so many vanishings—the derros. Even if the sound of the distant thrum of civilization doesn't carry down through the deep and forgotten tunnels, the heavy concentration of life seems to draw these diminutive but sadistic, pale-skinned, vacant-eyed maniacs near. They build their lairs below the sewers and secret ways of society, creating hidden holes to the surface if none exist and using these passages as highways to make secret invasions under the cover of darkest night. Possessed of a hideous familiarity with the fragile pathways of the mortal frame that allow even the smallest knife to cut deep and kill or maim, they snatch the unsuspecting from beds and midnight walks, dragging them down to the blue-litten catacombs of their laboratories below. For these monsters seek not only to sate their lust for pain, but to discover why it is that those who live above can abide the searing light of the sun, their experiments an attempt to discover the source of this unique quality that the derros lack. They do not always kill in the methodic pursuit of this quest, but those they return to the surface are only rarely released with their minds intact. For most, the time spent among the derros persists only as paralyzing night terrors and repressed memories of pain and fear.

ECOLOGY

The derros were not always the deranged lunatics they are today—in fact, they were once among the only denizens of the deepest vaults of the world who were not consumed with cruelty and hatred. In these ancient times, before the first derro emerged from its glowing cavern lair to look with jealousy upon those who lived under the sun's ruinous rays, their kind were known as the pech. Fey emigrants from the First World with strong ties to the Plane of Earth, the pech served even stranger masters as slaves. Under the direction of these now all but forgotten lords known today only as the Vault Keepers, the pech built and maintained immense caverns deep underground, their knowledge of earthcraft and its secrets allowing them architectural wonders that survive even to this day, untold eons after the Vault Keepers fled this world and abandoned the pech to their own fates.

Many of these pech grew angry and wrathful in the years following this abandonment, and turned on their kin in increasingly bloody and sadistic civil wars. It isn't clear which of the pech factions first abandoned their deep homes and began the long journey upward in search of a new place to live, but what is clear is that the further they drifted from the deep vaults, the more of this world they became. Just as gnomes have adapted to the world and have lost their deep connection to the First World, the wandering pech found themselves growing weaker and increasingly susceptible to mundane horrors like starvation and thirst. That the tunnels they ceaselessly climbed grew more and more barren further drove the pech to madness, and when it seemed that they must surely perish, for they had no supplies to return home for food or water, they came upon a savior—a pale blue fungus filled with life-giving nutrients and dripping with moisture.

Whether it was their long journey and evolution to be true denizens of this world, the effects of the strange blue fungus known as cytillesh (or "brain mold"), or a combination, the pech had forever transformed. Their bodies grew even lankier, pale and wiry with ivory hair and rough skin. Only in their basic humanoid frame, their white eyes, and their four-fingered hands did any real echo of the pech remain physically apparent—in their minds, no trace remained at all. And when the derros found that, not far above, the caverns opened into the limitless vault of the Overburn and that their flesh blistered and bled under the remorseless rays of the sun, they realized that they had come to their homes.

As centuries wore into eons, the derros spread throughout the upper reaches of the Darklands, yet they never grew numerous. Fecundity is a trait that eludes the derros, primarily because of the mainstay of their diets and the source of their bluish skin. Cytillesh causes brain damage, madness, and an inordinately high number of stillbirths, making the savior of the lost pech also their curse. Today, cytillesh holds an almost holy place in derro society—brain mold is their primary source (in many societies, the only

FACETS OF FEAR

Of all the monsters discussed in this book, the traditions of fear that fuel the derros are perhaps the most recent—for derros embody a combination of mass hysteria with the fear of abduction and unnecessary invasive surgery. Cattle mutilations and alien abductions are a very modern source of terror, one that despite persistent mundane explanations continues to haunt our nightmares. And tying derros to the themes of modern science fiction and horror as one encounters in shows like *The X Files*, movies like *Fire in the Sky* or *The Fourth Kind*, or books like Whitley Streiber's *Communion* isn't as far-fetched as one might initially think.

Although the derro race has been a part of the game for decades (since their first appearance in the first edition of the game in Gary Gygax's classic adventure, *Lost Caverns of Tsojcanth*), this was not their first appearance in literature. In the late '40s, *Amazing Stories* featured a series of tales by Richard Sharpe Shaver collectively known as the "Shaver Mystery." In these stories, Shaver claimed to have had contact with a sinister, ancient society of creatures deep underground. The stories were presented in the guise of fiction, but Shaver claimed that they were based on his actual experiences in the underworld, after he supposedly uncovered an ancient language that was the source of all languages on Earth. The creators of this language had long since departed the world, but they left behind their descendants—the rare and human-like "Teros" and the much more populous and deformed "Deros." Shaver claimed he had been imprisoned by the Deros, and that they had dealings with horrific aliens and could travel in spaceships. The deros kidnapped surface-dwelling people by the thousands for meat or torture and wielded strange powers and technology their masters had left behind long ago, and were responsible for many of the world's misfortunes and disasters. The stories were enormously popular, with many writing in to add their own experiences and encounters with the deros, leading to a strange sort of mass hysteria as the lines between fiction and reality blurred. Even after the stories faded from popularity, the myth of the deros persisted.

It's worth noting that the race we've chosen to approximate the role of the "Tero" on Golarion, the pech, also first appeared in the game alongside the derros back in *Lost Caverns of Tsojcanth*. Coincidence? Or Dero/Tero conspiracy?

source) of nourishment. They distill mind-altering drugs and poisons from its sap, dry its fibers into tough sheets for use as leather armor or the cords of their aklyses, light their caverns with its glow, and pen their rambling manifestos with brain mold ink. Much of derro society revolves around

the consumption of cytillesh, such that even if the race could shrug off the addiction to the fungus, they would be unlikely to want to change.

Those derros who survive the process of being born grow to maturity quickly, their growth likely enhanced by a diet of the strange fungus. A derro is full grown and ready to take part in raids or experiments by age 9, but can live as long as the oldest human if it doesn't succumb to violence before then.

Perhaps the most unusual feature of a derro's physiology is its violent allergy to sunlight. Bright light, while something of a discomfort for these creatures, holds no terror for them, but the rays of true sunlight can reduce a derro to a stinking pile of scabs, scorched bits of flesh, steaming blood, and dry bones in only a few days. Even exposure of an hour is enough to cause skin to blister and crack and hair to fall out in clumps, almost as if the creatures were suffering from an accelerated form of radiation poisoning.

HABITAT & SOCIETY

In their madness, the derros as a race have become obsessed with the sun—and with those creatures above who dwell in comfort under its rays. The driving racial goal of the derros is to discover what it is about the surface races that their own bodies lack—experiments with cytillesh deprivation or inflicting similar photogenic allergies upon surface dwellers have to date met with failure. Certainly, the race's endemic madness hurts their chances at progress, as progress by any derro conclave is quickly forgotten by its mad offspring. Yet still the derros toil on, ever driven to abduct new stock for their increasingly horrific experiments. They know their numbers pale in comparison to the denizens of the Overburn, and so are stealthy about those they take. They prefer to abduct only those whose presence won't be missed, focusing on prey found along waterfronts or in slums of the surface cities they invariably dwell below. On occasions when they need to return an abducted victim (either to test the results of their experiments in the world above or because of a fear that a victim allowed to go missing long enough for allies to notice might draw too much attention), the derros use mind-altering poisons to erase their victims' memories. When such unfortunates return to their homes, they often wake in unusual locations, disoriented and sometimes bearing strange aches or unusual scars (remnants of invasive surgeries hastily patched up by magical healing) and with patches of missing memory often stretching into several hours. Frightening and confusing, the long-term results of a derro abduction can be nightmares, personality changes, and even eventual madness—an insidious side effect of the creatures' attempt to keep their workings secret from the world.

Other strange occurrences can also be attributed to derro activity. Livestock mutilations are sometimes the result of derro hunting parties that steal out at night to procure exotic

meats for their platters or raw materials for their experiments, or might only be the derro version of a relaxing trip to the countryside after a particularly grueling week of work. In some places, folks tell fantastic tales of derros using strange circular flying machines to secure a vantage point from above to spy upon their victims, or rumors of derros with the ability to transfer their minds into the minds of human victims in order to live human lives for a day or a year. It is likely these tales are the result of hysteria—yet the derros are a creative and intelligent race infused with a heavy dose of insane insight, and it would be foolish to discount every tale one hears about them.

The derros are isolationists even among the other races of the Darklands, keeping to themselves and eschewing trade with races like the duergar or troglodytes. When a derro enclave finds itself in need of something it cannot provide, its first inclination is to take what it needs from its neighbors. In this regard, the derros generally look to nighttime raids of the surface above.

Derros need a constant source of new experimental stock, and are thus drawn to caverns below large surface cities—as a result, they are generally able to procure anything they need from these raids, targeting specific warehouses, merchant halls, or whatever happens to contain the objects of their desire.

Most non-derro denizens of an enclave are slaves. Morlocks and mongrelmen are the most common slaves found in derro society, simply because their flesh is not deemed edible by derros. Members of other races who find themselves captured by derros typically have only a short amount of time as prisoner, ending up on a derro platter, lightly cooked and seasoned with brain mold spores. Derros are consumed by a constant mental storm of new theories and ideas for their sadistic torture-experiments, and as such usually have little time for religion. Most derro enclaves leave matters of spirituality and faith to one or two priests—these derros invariably turn to a demon lord for enlightenment. Lamashtu is a favorite, for her association with madness and deformity, but other demon lords that derros favor include razor-lipped Andirifkhu, pustulant and fungoid Cyth-V'sug, master necromancer Orcus, or murderous and sadistic Shax.

Derros live in settlements known as enclaves—typically networks of caverns filled with traps and guardians along the outer edges, with derro living quarters and laboratories in the heart of the maze-like warrens. Their leaders are invariably known as magisters despite their actual class and training (typically alchemists, sorcerers, or rogues). In large enclaves, a triad of magisters sometimes shares responsibility of leadership, but this is somewhat rare—derros are nothing if not paranoid and quick to murder their kin for perceived conspiracies.

CAMPAIGN ROLE

Derros are an excellent race to use for an urban campaign that has ties to the Darklands. Whereas most of the races of the underground world are isolationists with little contact with the surface world (like the drow or duergar) or tend to dwell in remote regions when they do establish lairs in the upper reaches (like troglodytes or vegpeygmys), derros almost always select caverns under large cities as their homes. A derro enclave can feature numerous tunnels that wind up through the dark to connect with sewers, basements, and dungeons, often without the owners of such locations even knowing their homes have become the doorstep to a hideous horror from below.

Adventures focusing on derros should not bring the enemy on stage immediately. Instead, present the PCs with mysterious events that could well be the work of a more mundane maniac. Cattle mutilations, missing persons, and serial killers are all great “cover stories” that can develop into a conflict with a derro enclave.

Derros make great mid-level foes; they have an unusually high number of Hit Dice for a humanoid race, and when you start to stack class levels on a derro, he can quickly grow into a powerful foe. It can be fun

to have a long investigation into a sinister case of missing memories culminate in a horrific basement battle against a single derro. With their skill at stealth and their ability to use *darkness* and *ghost sound* at will, a derro can single-handedly “haunt” an old house. The PCs might track the clues left by a serial killer or an abduction to an old decrepit house rumored to be haunted, only to find that the house is in fact a front for an entrance to a derro enclave.

KNOWN DERROS

The most infamous of derros are generally their magisters. Yet when a lone derro gets separated from his society (either as a result of being the lone survivor of a cleansing raid from enemies or, perhaps more distressingly, after being exiled from his enclave for crossing some unknown extreme that even other derros might blanch at), these loners can make for incredibly dangerous foes. An example of each of these types of derros are presented here.

Mirgik: Whereas most derros are quite chaotic in their mannerisms, sometimes a derro emerges with the capacity to organize her thoughts and maintain well-laid plans. In many ways, these derros who manage to focus their evils are the most dangerous of all. Mirgik is one such magister, the leader of the derro enclave of Kmlin-Bru, the second largest derro settlement under Avistan. Located deep beneath the dungeons of an ancient dwarven Sky Citadel, Mirgik has formed a powerful alliance with Primarch Bremovir of Galt. Using

DERRO WEAPONS

The derros use several signature weapons designed to incapacitate foes for easy capture, but also enjoy using weapons that make clean slashing wounds that do not overly damage tissue on the mass scale that large bludgeoning weapons tend to do. Listed below are four of the more unusual weapons utilized by derros—all derros gain proficiency in the use of these weapons for free.

Aklys: The aklys is a short throwing club, usually of wood or bone, attached to a 20-foot-long cord. Most aklyses feature short iron hooks as well. An aklys has a maximum range of 20 feet, allowing the user to retrieve the thrown aklys as a move action after it has been thrown. Some derros wield aklyses drilled with holes so that, when thrown, they make eerie whistling sounds that can alert nearby derros of danger.

Crystal Chakram: Shaped and carved from quartz or stranger subterranean crystals, these circular throwing discs have jagged razor-sharp edges. When a crystal chakram strikes a foe, the weapon shatters into tiny sharp fragments; if it misses, there is a 50% chance the chakram shatters when it hits the ground or another solid object; otherwise it can be retrieved and used again. A crystal chakram is treated as ammunition for the purpose of creating magic weapons.

Fauchard: This polearm is similar to a glaive, being a curved blade affixed to the end of a pole. Unlike a glaive, though, the cutting edge of a fauchard is along the concave side, causing the blade to resemble that of a sickle or scythe. The resulting weapon is more awkward to utilize (and as such is an exotic weapon), but its increased threat range over a glaive and the ability to trip foes make it a dangerous weapon in the hands of a skilled user.

Injection Spear: The design of this insidious weapon, often stolen by surface races like gnolls or troglodytes (invariably resulting in lesser, one-use variants), allows the wielder to inject targets with poisons, drugs, or potions. The hollow head of an injection spear contains a reservoir that can contain up to five doses of liquid. When the head pierces flesh, a pressure-sensitive valve injects a single dose into the target. An injection spear is somewhat awkward to use; those without proficiency can wield it as a spear, but cannot use it to inject targets.

magic to appear as an attractive torturer and jailor, Mirgik has deceived the Primarch into thinking she is little more than the keeper of the massive underground prison known as the Dread Dungeons, a place where Primarch Bremovir can ensconce his enemies and various political prisoners and never worry again about their plots against him. Of course, these prisoners are little more than a steady and controlled supply of experimental stock and exotic food for the derro of Kmlin-Bru, and should she wish, Mirgik could organize the increasing number of lobotomized lunatic-thralls of the Dread Dungeons to mount a devastating assault on the world above.

Zyregek: Zyregek didn't survive a raid on his home, nor was he exiled by his magister. This violent and dangerous monster is a murderer among his own kind, a cannibal and sadist who quenched his thirst for pain by secretly slaying and then feeding on the bodies of his brothers and sisters in the small enclave of Voord under Ustalav's capital city of Caliphass. By the time the other derros of Voord found Zyregek out, he was able to hunt and murder them all before they had a chance to kill him.

He built a throne of their bones and now stalks the streets of Caliphass by night, seeking children, halflings, or gnomes that he can kidnap for his ever-consuming desire to surgically craft a bride and queen for his empty enclave. To date, his hideous attempts to turn a victim into a derro queen have failed, and he has gorged on their bodies and added their bones to his ever-growing throne.

DERRO POISONS

Derro create a unique poison from their favorite fungus.

CYTILLES EXTRACT

Type poison, ingested; **Save** Fortitude DC 18

Frequency 1/hour for 8 hours

Effect victim loses all memory of events that took place in the previous hour and cannot form new memories for 8 hours; these lost and prevented memories might return later as dreams, and can be returned with a *restoration* or *heal* spell;

Cure 2 saves. **Cost** 800 gp

SAMPLE DERRO

Presented here is a sample derro magister, a female sorcerer that represents the lower end of what one might expect to find leading a derro enclave. A derro magister like Evehxa is unlikely to be encountered on her own—she surrounds herself with loyal derro bodyguards or keeps close a charmed minion selected from her enclave's experimental stock to whom she may have taken a liking.

SPECIAL ABILITIES

Madness (Ex) Derros use their Charisma modifier on Will saves instead of their Wisdom modifier, and are immune to insanity and confusion effects. Only a *miracle* or *wish* can remove a derro's madness. If this occurs, the derro gains 6 points of Wisdom and loses 6 points of Charisma.**Poison Use (Ex)** Derros are not at risk of poisoning themselves when handling poison.**Vulnerability to Sunlight (Ex)** A derro takes 1 point of Con damage after every hour it is exposed to sunlight.

ECOLOGY OF THE DEVA

by Chris Sims

illustrations by Howard Lyon

Neither fire nor wind, birth nor death can erase our good deeds.

—Prince Gautama Siddhartha, Buddha

Do not be too moral. You might cheat yourself out of much life so. Aim above morality. Be not simply good; be good for something.

—Henry David Thoreau

Most immortal beings are separate from the world. They live on another plane altogether, detached from the worldly concerns. Angels and devils, gods and exarchs pursue otherworldly agendas in the Astral Sea, often without concern for the world.

Not so with devas.

Devas are immortals who chose to join the world on its perilous journey. Although a few of these strange beings transcend the mortal plane, most are bound to whatever fate the world suffers. As a people, devas struggle to make sure that destiny is a positive one.

HISTORY

As a race, devas are among the eldest beings in the world. In the earliest days of existence, they were goodhearted angels, some of whom served the good gods. Looking upon the forming world, these angels felt a yearning they could not resist. They descended from the heavens to take on mortal seeming out of a love for the world's countless wonders. Out of a desire to protect and nurture, they came. With a desire to experience the world, they manifested in the world.

To do so, legend holds, the would-be devas made contact with the great primal spirits awakening in the ancient world. With these spirits they struck a bargain. The angels gained the ability to manifest in a form like that of worldly humanoids, but they had to bind themselves to the world. Never could they return to the Astral Sea. Caught in the endless coils of the World Serpent, the would-be devas would make the world their home . . . forever.

Although the primal spirits recognized the purity of the angels' intentions, the spirits also wisely saw the changeability of creatures born into the world. They knew that this dynamism helped ensure the cycles of nature continued. So the spirits sought balance, naming another price as part of the bargain. As long as the angels manifested as devas expressed virtue, they could be reborn in immortal bodies marked by their astral heritage. In this "Wheel of Rebirth," as devas name it, each deva's memories would be preserved by tenuous connections carried from life to life. However, deviation from the high ideals the angels professed could cost a deva everything.

The spirits declared that a "fallen" deva—one who became corrupt and valued worldly desires in wicked ways—would not escape the Wheel of Rebirth. Instead, that deva would be reborn in a form that revealed his or her wickedness in bestial features. Such beings, bearing the memories of lifetimes with them and serving evil ends, would be the bane of devas and other mortals.

Assured of their ability to remain pure despite the temptations and trials of the world, the angels who became the first devas agreed to the bargain. Their immortal forms fell away as they passed into the earth and into the care of the primal spirits. After a period of vague dreaming, each awoke alone and in an unfamiliar body. Each made his or her way in the early world.

These were but the first among a host of angels that made the world their permanent home in the dawning of time. When the Dawn War began to rage across existence, more good angels came earthward to defend, lead, and teach other mortals. Among these astral warriors were more servants of the good gods than came in the earlier days. All struck a pact with the primal spirits, an agreement that evil angels seemed unable or unwilling to make. They then took up the cause of the gods against the primordial.

When the primal spirits declared an end to the Dawn War, the gods and primordials left the world behind. It became a middle place where matter and spirit can coexist in a vibrant manifestation of possibility. Devas endured as they had before—as zealous astral spirits tied to the mortal world and to fate.

Another myth attributes the emergence of devas to this particular time. During the war across the world, numerous angels had developed affection for the place and its creatures. They had relationships they refused to sever and desires they could not fulfill as immortal servants of the gods in the distant Astral Sea. Although this tale differs in its timing, the manner by which the devas tied themselves to the world remains much the same. This fable indicates that only some gods, none of them evil, gave their servants this freedom of choice. It also suggests that only the noblest angels were willing to give up the glory of life in the Astral Sea for a series of incarnations in the world.

No matter what the truth of deva origins, it was by the leave of the primal spirits that angels could

manifest in the world as devas. The assent of the primal spirits for such a transition between planes disappeared when the Dawn War finally ended for good. The same ban that holds the gods and primordials away from the world prevents the creation of new devas.

From their beginning, devas have led lives largely isolated from one another. Unlike tieflings and dragonborn, devas have never been numerous enough or in close enough contact with each other to raise a deva empire. Regardless of this, few devas have lived quiet and peaceful lives in which they influenced little in the way of goodness and progress. Devas are drawn to oppose evil and to thwart oppression, as well as to ease suffering.

Some of the world's greatest heroes have been devas or those with deva heritage. A few of the vilest villains known to history have also been devas. A deva seldom falls so far from a state of grace that he or she cannot reincarnate as a deva. Those who do fall know it, and the certainty of reincarnation as a rakshasa leads such devas to embrace evil without regret or remorse.

Devas cannot die, but most sages suspect that devas are a still race in shallow decline for a couple of reasons. Those who become rakshasas diminish the number of devas in the world, to be sure—but it seems likely that devas still outnumber their evil counterparts. Devas can also transcend the world (see "Culture" and "Religion"), evidenced by the few legendary devas who have reached such a state. Still, one might consider a transcendent deva to still be a deva. Further, devas and those who study them suspect that a parallel reincarnation cycle affects rakshasas, which begs numerous questions. What happens to a rakshasa that redeems itself? Can a rakshasa become a deva again? If so, how?

PHYSIOLOGY

The physiology of a deva is much like that of other humanoids—humans in particular. As living creatures, devas have physical needs and capacities for which their bodies are shaped. Much of this shape is a result of the deal the original angels made with the primal spirits. To experience the world, devas received a form suitable to the world. Their striking differences from humans and other humanoids are what set them apart and mark them as worldly creatures with a truly otherworldly origin.

APPEARANCE

Deva bodies are almost always perfectly formed by the standards of attractiveness humans and similar races, such as elves and eladrin, hold. As a being with a soul from a realm where form follows thought, devas have some unconscious influence on the form in which they manifest. Therefore, a typical deva is tall, slim, and athletic. He or she has an imposing air, along with poise and grace few can match. Combined with the pleasant personality most devas have, this physical perfection makes devas extremely attractive to other humanlike humanoids.

An ideally shaped body is essential for working well within the world. When a deva deviates from this expected norm it is because he or she has suffered grievous harm, such as the ravages of a disease or severe injury. Even so, where life continues, a deva's body eventually recovers from all but the most debilitating injuries, reshaping itself according to the soul's superlative model. Occasionally, however, the deva has elected—in a past life, and perhaps even unconsciously—to experience the world in a different way during a particular incarnation (see “Psychology” for why). Further, even the most robust devas can't regrow lost limbs and organs.

Despite the fact that deva bodies are usually ideal, devas are clearly marked as “other” by their unusual

skin, hair, and eyes. Deva skin harkens to the coloration of the heavens, varying in hues of blue, violet, gray, or black. A deva's body also has lighter areas that are white or pale gray, and the lighter or darker areas might be dominant. The two colors that make up a deva's skin tone form patterns unique to the individual. These hues, or only one of the two, also color the deva's hair, although some variance has been seen, often stemming from a past-life event. Although the weight of a deva's gaze is always apparent, deva eyes are pale gray or white, without an iris or a pupil.

Deva coloration and patterns are thought to be marks primal spirits imparted to show a deva's particular past-life experiences, lineage, and/or destiny. Therefore, they are sometimes referred to as “signs.” Similarities in signs can indicate a pair of devas is related in some way, but the rarity of the deva species and the devas' habit of concerning themselves with tasks that are more important than academic pursuits make detailed study of signs difficult. Another limiting factor to subjects for study is that a single deva is immortal, and so he or she might outlive generations of a would-be studier's people.

LIFE CYCLE

Devas are immortal beings, and from the beginning of their existence as a people they have sprung into the mortal world as fully formed adults. A deva's immortal nature manifests as agelessness. It, along with the tie to the world from the bargain with the primal spirits, also shows up in the uncanny deva ability to reincarnate.

Although a deva comes into the world as an adult and does not age, a deva can die. Disease takes a few. Violence takes a greater number—rare is a deva who remains passive in the face of threats to people, places, and objects he or she loves. Those who make it to an age other races might consider elderly are

frequently still hale. But world-weariness or a desire for a fresh perspective can lead such devas to “drop the body,” which is a deva phrase describing the transmigration of a deva soul out of a physical body without the presence of any other condition normally required for death. Such devas simply choose to die for the sake of achieving some other desire.

When a deva dies, his or her body remains like those of other mortals, although some who drop the body have been said to disperse as motes of light. Whatever the case with the body, a deva's soul doesn't go to the Shadowfell like the souls of other mortals do. Instead, the soul stays in the world where it is bound by the ancient primal pact. The soul undergoes the “bodiless dreaming,” as devas call the period between incarnations. During this time, the soul wanders the spirit realm of the world, and some claim it experiences up to an entire lifetime in that ephemeral region of time and space. What the soul does in the spirit realm is a mystery, but the few revelations that exist suggest that the deva acts as a powerful ancestor spirit and caretaker of the world even in this in-between space.

Stories of this “bodiless dreaming” come from various sources, including druids, shamans, and others who interact most directly with the primal spirits. It is said to be a blessed state wherein the deva remembers all lives lived and can put that knowledge to use. The most compelling proof of this state comes from a small number of devas who have had what devas call “bodiless waking,” “waking dreaming,” or “disincarnate.” Such devas are between physical bodies, but through strange fate, outside influence, or powerful willpower, they can interact with the material world as ghostlike beings. These “disincarnates” often remember more than one past life. They usually work to fulfill some unfinished task from the previous life or to help the progress of the world. Some serve the aims of mighty primal spirits, while others strive to avoid or hasten reincarnation. A fraction of such disincarnates is wicked or corrupt,

sowing mischief from the spirit realm and perhaps trying to evade reincarnation as a rakshasa.

The time a deva spends between bodies is variable, but it is almost always more than a year and often seven years, or more. Tales have spoken of devas who die and fail to reincarnate for more than a century, but such legends include an unusual factor, such as a particularly horrible death or a long period of disincarnation. During this time between incarnations, a dead deva can be raised from the dead if he or she is willing and if the ritual is powerful enough. Rituals also exist that allow a ritualist to speak to a departed deva's wandering soul.

When the bodiless dreaming comes to an end, the deva reappears in an explosion of dazzling light at a safe place sacred to the spirits and, at times, the gods. A humanoid body spontaneously forms from available elements in the environment, aided by the primal spirits. The deva's new physical body-mind, more limited than a spiritual form, cannot contain the weighty memories of myriad lifetimes. These slip away so the deva can experience life anew, unpolluted by notions formed in another time and place. However, such memories remain ingrained just out of conscious reach, accessible in meaningful visions, insights, and dreams. The deva's new body and mind are wholly different, perhaps even down to the sex.

Even though they have sexual characteristics, devas cannot propagate their own species. This being the case, a few among the wise have wondered why devas incarnate in bodies that are clearly and functionally masculine or feminine. Strangely, devas can and do mingle with some other humanoid species, passing a measure of angelic power into nondeva bloodlines. Those who have a deeper understanding know the primal spirits intended this manifestation of the astral within the natural humanoids of the world all along—perhaps even as a balance to the elemental genasi, who have a history at least as long as that of the devas.

PSYCHOLOGY

When a deva is reborn, his or her personality is mostly formed. Although past life experiences and drives influence this new personality, it is wholly new. The deva can function as a mature and responsible adult, with morality according to the current incarnation's inclinations. Life's trials and experiences, of course, shape a deva's views, but the typical deva is simply born good.

From this beginning, a deva has a strong personality and, most often, an overwhelming yearning to do good. A powerful will coupled with strong desire and purity allowed a deva to incarnate in the world for the first time. Multiple lifetimes, perhaps uncountable, have shaped that resolve and drive. Each deva is unique, but they share common personality traits rooted in the truths of their being.

Purpose drives a deva's daily existence. Although the purpose might differ from deva to deva, few devas while away the years idly. The principles and aims driving a deva's life are sometimes mysterious, linked to unfulfilled goals and flashes of memory from previous incarnations. More often, however, a deva has clear goals related to his or her current incarnation, personality, and circumstances.

Dedication to a goal, ideal, and/or cause comes easily to devas. Immortality facilitates this tendency in more than one way, tempered by the deva tendency to fix problems. First of all, a deva realizes he or she has time to accomplish a task, but a deva is rarely content to wait and see when direct action might work. Secondly, a deva knows that death is not the end, and therefore he or she pursues aims with a fearless zeal. This keenness can border on or spill over into fanaticism in some cases.

Even so, thoughtfulness and tolerance tempers the zeal of most devas. Numerous lifetimes in the world give each deva a broad, subconscious sense of the wondrous diversity creation holds. A deva's heart

KNOWLEDGE OF THE DEVAS

Arcana

DC 10: Devas have a talent for various forms of magic power. This natural talent comes from their incisive minds and curiosity. Their power is honed through each deva's perfectionist nature.

History

DC 10: Devas appear regularly in chronicles from very early times, and they rarely play merely minor roles in major events. It seems they are a people given to action and greatness.

DC 15: Devas are few in number. Their population is spread widely across the world so much so that two devas are seldom in close proximity to one another.

DC 20: Devas are bound to the world through an ancient pact good angels made with primal spirits. This is the source of their ability to reincarnate. The primal spirits no longer allow angels to incarnate as devas in this way.

DC 25: The Vale of Descending Stars, a lush region of primal wilderness, contains a platform and henge shaped of rocks that seemingly emerged from the earth fully formed. Around this location are the remains of an ancient settlement. Legend has it that this is where angels who became the first devas made their bargain. The word spread from the vale across the world among angels who wanted the same transformation. Some remained or came to the valley in the early days, until time scattered the devas. Some whisper that rakshasas have since claimed this holy place, which has connections to the Astral Sea.

Religion

DC 10: A character with this level of knowledge knows the general traits of devas—such as the fact that they are immortal humanoids who reincarnate when they are killed.

DC 15: A character with this level of knowledge knows the details of deva physiology and development, as well as the intricacies of their society. For instance, devas have strong ties to the Astral Sea because of their origins as angels that chose to incarnate in the world in humanoid form.

DC 20: A character with this level of knowledge knows the details of deva reincarnation, such as soul recognition, bonded incarnation, and corrupted devas reincarnating as rakshasas.

DC 25: The Raven Queen bears no ill will toward devas, despite the fact that devas seem to be outside the normal cycle of life and death. Devas experience death and loss, as well as the renewal that death allows. Some devas break the cycle of reincarnation, and a few of those have truly passed into death.

smiles at the possibilities the world holds, and he or she feels a strong pull to nurture these possibilities.

Most devas are fine with the practices of a culture or individual, as long as such customs or deeds do no harm. Further, devas stand up for the rights of others to express their beliefs and desires in progressive and positive ways. A deva judges events and creatures situationally, rather than according to traditions or preconceived notions. For instance, a deva is unlikely to help quash a cult if that cult is improving the lives of others—even if the religious authority in an area disapproves of the cult. A deva is more likely to pay for the bread a street urchin stole to feed himself and his sister rather than punishing the desperate child for stealing.

Love and a desire for bettering the world deeply color the actions of the typical deva. Even a zealous deva tries to find the good in a situation and to bring that good to the fore. A deva also gives freely of skills, time, and resources, seeing everything as transient but wishing to ease suffering. Open-mindedness and enthusiasm lead a deva to apply this giving nature across all aspects of life.

This is because devas enjoy being in the world, and they love exploring and experiencing it. They like to have contact with a diverse set of acquaintances and friends, and they prefer variety in their experiences. The deva capacity for love, influenced by the willingness to explore life, also leads devas to engage in deeper relationships, even marriage, with other humanoids that are much like them in physical structure and size.

Any kind of relationship with a deva—enemy, friend, or lover—is intense. Devas are ardent in their emotions, although the typical deva is seldom given to outbursts of so-called negative feelings. Righteous outrage is more likely than self-indulgent wrath, for instance. But when a deva feels an emotion, those close to him or her know it. A deva is honest about his or her feelings and thoughts, only holding back when the truth might injure another or decorum demands

restraint. Even then, a withering glare or smile shown in the eyes might give the deva away.

Most devas are too collected, however, to give away any emotion unintentionally. Devas are exceedingly self-aware. What seems like self-control and preternatural calm to others is really just a deva's willingness to look at his or her emotions and points of view with a measure of detachment. This objectivity stems from the deva's intuitive connection to the experiences of countless lifetimes, as well as a willingness to be honest despite appearances. Again, things of the world are transient—especially emotions—and oftentimes a deva can't shake the feeling that this has all happened before.

Deva calmness isn't altogether mystical, however. Their unique origin and history provides the mental space for devas to foster grace and sophistication. Their tendency toward kindness allows devas to see the best in situations and people. Reincarnation carries with it the fleeting influences and tastes of past lives, meaning that devas are also born with sensibilities refined in ways a human couldn't hope to acquire in one lifetime.

Striving for perfection is also part of the deva psyche. What a deva lacks in natural inclinations or mystical refinement, he or she makes up for by living purposely in a way he or she considers right. In fact, devas believe that focusing on smoothing out rough mental and spiritual edges ensures outcomes—in this life or the next—that are more favorable. A few devas also seek perfection in the belief that reincarnation has this as one of its purposes, and that one can transcend reincarnation through perfection.

For this reason, devas don't shy away from unpleasant experiences—although neither do devas seek or perpetuate such. Suffering can point one in the right direction to go in a worldly life. Such events shape the deva's personality going forward in time, and they can lead to enlightenment through the understanding and overcoming of suffering or

disability. In such sorrows, a deva also expands his or her compassion.

Although suffering is sometimes necessary as a pointer, devas know it is not essential to existence. Few devas allow others to suffer if the deva has the power to lend a hand. Unknowable are the paths of fate, and when destiny places the needy under the eyes of one who can help, the message is clear. Devas recognize that part of perfection is harmony with the world and its inhabitants. Part of harmony is working together for the good of all.

Devas strive for perfection. For various reasons, few have accomplished such an ideal. Devas are fallible. Enthusiasm and curiosity can lead a deva astray, away from ideals, toward pleasure, or into worse fates. Some stumble into wickedness and find they cannot turn back, while a few walk knowingly toward evil and become irredeemably corrupted. Less grim, perhaps, is the fact that devas are bold doers all too willing to stand in the breach to save and protect others. Countless devas die before perfection becomes a realistic option. Then reincarnation forces them to start over, at least in a manner of thinking.

All devas know that with death comes the loss of all concrete connection to the life they now know and love. This disconnect—the disappearance of memory, of all that one is, into the hazy past—is a typical deva's greatest dread. (Few tread a path so dark that they actually fear reincarnation as a rakshasa.) Yet so fearless are these immortal folk that one would quickly choose a courageous death over survival at the cost of allowing others to suffer and die. Loss of memory is a price worth paying to make the world a better place.

CULTURE

Time, space, and the fickleness of memory separates devas. They have no lands to call their own, and few threads of history unite them. A deva might die only to reincarnate half a world away from the place of

death. Nevertheless, devas have a shared ancestral memory all the way back to their original incarnations as angels. Through this, devas share traits that can be described only as cultural.

SOCIETY

No overarching deva society exists. Incarnated as fully socialized adults, and advantaged with unearthly beauty and a wholesome reputation, devas have little trouble integrating into other societies. Most non-evil humanoids welcome a deva among them. A deva lives where he or she feels comfortable and useful, usually in a larger settlement. In such a place the deva builds a home and relationships, and mixes with the population.

This is not meant to suggest that a deva disappears among the masses, becoming one with the crowd. On the contrary, devas are exemplars and leaders among their fellow citizens. A deva might champion social causes that increase health, justice, and prosperity. He or she might devote time and talent to defending the populace from monsters and evil. Often, a deva does both.

In this active role, a deva quickly makes friends and gathers hangers on, and he or she surely makes a couple of enemies. Amiable and giving, a deva is likely to have a large circle of admirers, fond acquaintances, and boon companions. In a deva's mind, close friends form his or her family or clan.

Devas can also have actual families, although this practice can be hard on those involved. A deva might marry, and he or she can even have children with a nondeva. When this happens, the family unit is very important to the deva. Devas nurture their loved ones, taking proper responsibility and teaching youngsters with the utmost care so that they know right from wrong. Immortality, however, can force a deva to watch a beloved spouse and children age and die. The deva's family must relate to their ageless

member, as well as his or her nature as a heroic seeker of spiritual perfection.

Some of this applies equally to normal friendships. Getting along as or with a deva isn't always easy. More than one deva has fallen while attempting to relate to the world.

REBIRTH AND DEATH

Devas aren't reborn just anywhere. Specific areas in the world seem to be focal points for reincarnation. These places are usually sacred in some way, either

to the primal spirits or to the gods. Most commonly, reincarnation occurs in a hidden, pristine natural locale. Guardian primal spirits keep the vicinity free of danger and provide the deva with what he or she needs to move forward in a new life. Occasionally, such a place has humanoid stewards as well, and these persons are likely to be helpful toward the deva. Even when a place is sanctified to the gods, the primal spirits are involved somehow. A godly reincarnation spot is more likely to have humanoid keepers who see the deva's arrival as a holy omen. If the spirits don't provide for the newly born deva, these humanoid caretakers are likely to do so.

The occurrence of reincarnation is unpredictable, and thousands of possible sites exist across the mortal world. Only rarely does a location become a target for evil creatures, much less become lost to corruption. Even when one is, devas simply cease reincarnating at that spot until it is reclaimed. The spirits and forces of good move aggressively to do so.

BONDED INCARNATION

In exceedingly exceptional cases, two or more devas have a strong bond that sees them reincarnated at the same time and in the same place. Two is the usual number. Devas and primal spirits refer to the rebirth of two devas in this way as "twinning," while the birth of more devas is called "bonded incarnation." The link for bonded incarnation might be as simple as love or a shared set of beliefs and goals, or as complex as a plan concocted by two deva souls during a period of waking dreaming.

SOUL RECOGNITION

Clear memory fails devas when they reincarnate, at least until one approaches or achieves transcendence. Still, devas have been known to instinctively recognize creatures, objects, and places important to them in a past life. Similarly, those

who knew a deva in a past incarnation might have a similar experience when they meet the same deva in its current incarnation. Animals are particularly affected by this occurrence. Devas call this phenomenon “soul recognition.”

Soul recognition occurs most often to facilitate renewing of contact among old acquaintances or to impart an important piece of information to the deva. Fate seems to have a hand in soul recognition, too. Seldom do two devas meet each other, a rare event on its own, and fail to have a soul recognition moment.

DEATH

Death usually comes quickly to devas, since many die in battle against evil. A deva is rarely concerned with what happens to his or her body after death, seeing the body as a mere shell to contain the soul. On the other hand, a deva is very respectful of the dead, honoring them in whatever way seems appropriate or necessary.

A deva who plans to drop the body might surround the event with some ritual or celebration of life. When transcendence is assured but the body must pass, a deva might undertake similar rituals or celebrations before dying. Devas are unified in preferring that their loved ones not grieve for them, since death is surely not the end. To nondevas, this philosophical point of view is easier said than done.

MAGIC

Devas are magical creatures—of this there is no doubt. They are also incisive, clever, and altogether strong of mind. The arcane power that flows through the planes sings to some devas, drawing them to experience its flow. As with all aspects of life, a relationship to the arcane is personal and spiritual to a deva. Mastery of arcane forces, like the mastery of the self, requires exploration and firsthand

knowledge. No path of arcane skill reflects the deva mindset better than that of the wizard. Being a wizard means dealing with arcane forces without intermediaries, such as a warlock has, or taking a connection to the arcane for granted, as a sorcerer might.

A deva uses magic with precision, favoring astral and angelic energies that are unlikely to go out of control, such as cold, lightning, psychic, radiant, and thunder. On the battlefield, a deva magician is composed and deadly. Guided by careful study and clear intent, he or she directs magical forces to bring conflict to a favorable outcome. In doing so, a deva is careful to manage collateral damage to friends, innocents, and the environment. Control comes naturally to devas in the way they practice spellcasting, as well as the way they help their allies and hinder their enemies.

RELIGION

To devas, life is a personal spiritual journey for the individual and for those with whom the individual has contact. Religious beliefs and practices are private to devas, and each deva prefers to keep a relationship with gods and/or godlike entities as he or she sees fit. Equally, a deva respects the beliefs of others—unless those beliefs are malevolent or harmful. Deva clerics, for instance, gain converts by being a shining example of the tenets of good deities rather than by actively seeking or preaching. Few devas are members of any specific religious order, and anyone a deva influences is unlikely to be directed toward an institution. Instead, such a one might be encouraged to seek the holy on a very personal basis, as the deva does.

A deva might show respect at a shrine or even offer sacrifices at a temple. However, devas live their spiritual beliefs instead of saving their piety for holy days and the temple sanctuary. They are also open with displays of religion when doing so is not offensive to

others. For instance, most devas devote time to restful meditation. A deva might openly vocalize small prayers throughout the day, even invoking differing deities for different events and tasks. He or she might make a ritual offering at a certain time of day or when omens dictate. A specific action could be ritualistically performed. Each deva has quirks surrounding his or her individual spirituality.

Direct connection is important to devas. Divine power is the ultimate expression of such a link to the deities, so that source of power is particularly appealing to devas. This is one reason why invokers—unequivocal conduits of divine power—are common among devas, as are clerics. Similarly, direct ties to the primal spirits might appeal to a deva, and a shaman has the closest relationship to these spirits. The druid is a close second.

TRANSCENDENCE

Eventually, and sometimes intuitively, devas learn of the concept of transcendence. Stripped to its most basic meaning, this word refers to a deva rising above the normal state of deva being. It connotes removing oneself from the Wheel of Rebirth by reaching an ultimate level of spiritual perfection. A deva who reaches transcendence invokes a secret part of the agreement with the primal spirits. Such a deva is no longer bound to the world and resurrection. At the next death, the deva is free to choose another path. Commonly for a transcendent deva, all the details of all the deva's past lives can be recalled at will.

Although few devas accomplish this sort of transformation, the outcome for each transcendent one is different. A deva who becomes an exarch or other sort of immortal being, maintaining his or her current incarnation across the ages, is a transcendent being. So is one who breaks the bonds of reincarnation and passes into legend and beyond the mysterious veil of death. Other devas transcend the

Wheel of Rebirth but voluntarily remain in the world among its greatest spirit guardians and teachers.

ART

Deva artistic expression, from architecture to smithing, is cerebral, simple, and elegant. It also is only a part of the average deva's active life—devas have and engage in diverse interests. Spiritual themes are common—angelic, primal, and godly. Devas engage in artistic endeavors for the experience and refinement doing so offers. They are careful and patient, creating elaborate works that evoke precise emotions or present otherworldly beauty. Many deva artisans see performing the work of creation as a form of meditation on the nature of existence and reincarnation.

Thus, even if it is later displayed or used, a deva's artistic work is intensely personal—a labor of love. If the work is intended as a gift, it expresses what the deva feels about or sees in the receiver. Whether a created object later brings social or monetary reward is of little concern to a deva. This fact doesn't change another: The end result of a deva's toil is usually breathtakingly exotic or beautiful, and often suited only to a specific person.

In this vein, devas take the most care with their personal look and environment. Although devas prefer a simple lifestyle, they take the time to give everything a touch of beauty. A deva wears fine clothes and uses fine tools, and keeps such items in good condition. A deva's living space is clean, with even utilitarian objects given an ethereal or angelic flair.

LEISURE

When life is about accumulating experiences and learning, how one spends one's leisure time becomes important. Devas are relaxed about leisure activities, even though they like to spend their time well. Devas

don't feel they always have to have something tangible to show for their leisure activities—a closer bond of friendship might be more valuable than learning something new. Further, devas usually feel they have plenty of time to engage in each activity to the fullest. Devas love celebrations (and sweets), sporting events (as participants or spectators), games (especially intellectual ones), and the like. They also enjoy whiling away the time with a good conversation, the more philosophical the better. Crafting and decorating is also another deva leisure pursuit.

Devas have little use for what some consider to be leisure activities. They avoid dissipation and indolence, although they might tolerate such in others. However, a deva cannot abide activities that harm or abuse some of the participants. For instance, no normal deva would put up with a gladiatorial event in which the bouts are unfair or the participants unjustly coerced. That said, most devas work within the law to change distasteful aspects of society. Doing so might be another “leisure activity” for a heroic deva, who takes up sword or spell against darker facets of life.

FEATS

Devas and those related to them have access to an array of feats in every tier.

BLOODLINE FEATS

The Deva Heritage feat and related feats are bloodline feats. All bloodline feats are noted as such in the feat's name. You can have bloodline feats of only one type. If you choose the Deva Heritage feat, you can have only Deva Bloodline feats.

If you are a deva, you have a couple of considerations with regard to bloodline feats. You can choose Deva Heritage, but you don't need to do so to access Deva Bloodline feats. Taking Deva Heritage just means you have focused on your angel heritage, strengthening its expression. Since devas don't have

deva children, bloodline feats other than Deva Heritage are hard to come by without a unique story. It's ultimately up to the DM whether you, as a deva, can acquire other bloodline feats.

HEROIC FEATS

Any feat in this section is available to a character of any level who meets the prerequisites.

BATTLE INTUITION

Prerequisite: Deva

Benefit: You can use your Wisdom modifier in place of your Dexterity modifier to determine your initiative bonus. Additionally, you gain a +2 feat bonus to initiative checks.

DEVA HERITAGE [DEVA BLOODLINE]

Prerequisite: Living humanoid race

Benefit: You gain astral splendor as a utility power. Also, you gain a +2 bonus to Perception and Insight checks against angels, devas, devils, and rakshasas.

Astral Splendor	Feat Utility Power
<i>You take on an imperious aspect, and silvery light—that of your astral soul—shines from your eyes, mouth, and heart</i>	
Daily ♦ Stance	
Minor Action Personal	
Requirement: You must be not bloodied	
Effect: Until the stance ends, enemies take a -2 penalty to attack rolls made against you. You also shed bright light within 6 squares.	
Special: This stance ends when you become bloodied.	

HEAVENLY HERITAGE [DEVA BLOODLINE]

Prerequisites: Wis 13, deva or Deva Heritage

Benefit: When you take cold damage or fire damage, you gain a number of temporary hit points equal to your Wisdom modifier.

IMMORTAL SKILL

Prerequisite: Deva

Benefit: When using *memory of a thousand lifetimes* to modify a skill check or ability check, you treat a result that is lower than the average for the die you roll–3 for d6 or 4 for d8—as the average.

RADIANT RECOVERY [DEVA BLOODLINE]

Prerequisites: Con 13, deva or Deva Heritage

Benefit: When you hit with or are damaged by an attack that has the radiant keyword, you gain a number of temporary hit points equal to your Constitution modifier.

SCOURGE OF THE FALLEN

Prerequisites: Deva, good or lawful good alignment

Benefit: When using *memory of a thousand lifetimes* to modify an attack roll against an evil immortal creature, you can also add the result to your damage roll.

UPRIGHT REVIVAL

Prerequisite: Deva

Benefit: If you drop to 0 or fewer hit points and fall unconscious, when you regain 1 or more hit points and become conscious, you stand and shift 1 square as a free action.

PARAGON FEATS

Any feat in this section is available to a character of 11th level or higher who meets the feat's other prerequisites.

IMMORTAL RESILIENCE

Prerequisites: 11th level, deva, Immortal Skill

Benefit: When using *memory of a thousand lifetimes* to modify a saving throw, you treat a result that is lower than the average for the die you roll–3 for d6 or 4 for d8—as the average.

REMEMBERED MOTHER TONGUE

Prerequisites: 11th level, deva

Benefit: You can speak, read, and write Supernal. If you wish it, listeners who don't speak Supernal can understand your words as if you used their native language.

SHARED CHANNELING

Prerequisites: 11th level, deva, Channel Divinity class feature

Benefit: Your Channel Divinity powers that have a range of personal gain a range of close burst 5, enabling you to target yourself or one ally within the burst. If the power has a trigger, you or the ally can trigger the power, but the triggering creature must also be the power's target.

EPIC FEATS

Any feat in this section is available to a character of 21st level or higher who meets the feats other prerequisites.

IMMORTAL PROWESS

Prerequisite: 21th level, deva, Immortal Resilience

Benefit: When using *memory of a thousand lifetimes* to modify an attack roll, you treat a result that is lower than the average for the die you roll–3 for d6 or 4 for d8—as the average.

WINGED REVIVAL

Prerequisites: 21th level, deva, Upright Revival

Benefit: As a free action triggered when you stand due to Upright Revival, you can fly a number of squares equal to your speed.

ENEMIES AND ALLIES

Devas are champions of the innocent and the righteous. Since they live among other races, and they have personality traits that make them easy to like, devas work well with a variety of people. Equally, nondevas usually admire devas and look to a deva as someone who can be relied upon to do right and abide by the law. Long-lived races, such as eladrin, have a better handle on the deva mindset. Through this like-mindedness, some devas end up in the Feywild, enjoying a circle of friends less likely to dwindle and disappear over time.

A deva is likely to be the center of a party of heroes. When that's not the case, a deva is often a lone do-gooder. When one meets a deva, an honest request for the deva's aid in a good cause is apt to be answered positively. Normally, devas stand against all evil—especially that of the Astral Sea and Elemental Chaos. Most evil beings return this hostility, although some—devils, for instance—prefer to target devas for corruption.

It must be remembered that devas are indeed corruptible. The existence of rakshasas proves this, which most devas willingly admit. Good-hearted devas consider their corrupted kin only marginally

better than rakshasas. Both are capable of great wickedness, yet legend holds that both are potentially redeemable. Still, an evil deva is a fearsome opponent. He or she has the fearlessness and zeal of any other deva, but these qualities are turned to iniquitous ends. Evil devas, knowing the fate that awaits them, are more likely to fear death and fight viciously to avoid it.

Even in between incarnations, a deva can be an ally or an enemy. Some deva disincarnates can manifest in the world to pursue their goals. When one does, the disembodied soul might seek out agents to influence or students to teach, for good or ill. The wisdom imparted from the world of the spirits is profound indeed, made more so when it comes from a being that can remember multiple lives in the world. An disincarnate could guide or thwart heroes or villains, only to reincarnate later as a potential ally or enemy in physical form.

Devas maintain an affinity for angels—those who have the form devas once held. To good angels, typical devas are polite and respectful, like one might be to a kind elder sibling. (Corrupted devas vary in their approach to angels.) Angels recognize the nature of their worldly kin, and as such, they show a deva some deference in turn. If the angel and deva do not share a bond of common morality, the relationship can range from fine to tense to antagonistic.

ENCOUNTERS

Devas are natural warriors in the broadest meaning of that term. Each deva meets a challenge with courage born of immortality and fierceness birthed of a desire to end conflict quickly and, often, with minimal suffering. Most devas try to manipulate the battle to assist their allies and to deal with enemies efficiently.

DEVA SEER

The deva seer is deeply connected to the world and the primal spirits as a way to eventually transcend ties to either. Learning, experiencing, and seeing clearly is the goal, rather than the normal deva pursuit of goodness.

Deva Seer	Level 8 Controller (Leader)
Medium immortal humanoid	XP 350
Initiative +8	Senses Perception +14
Clarity Shared aura 5; each ally within the aura gains a +4 bonus to Perception and Insight checks.	
Convey Weaknesses aura 2; each ally within the aura who can hear the deva seer has combat advantage against enemies within the aura.	
HP 87; Bloodied 43	
AC 22; Fortitude 19, Reflex 20, Will 21; +1 to all defenses against bloodied enemies; see also <i>seer's trip</i>	
Resist 9 necrotic, 9 radiant	
Speed 6	
⚔ Quarterstaff (standard; at-will) ♦ Radiant, Weapon	
+13 (+15 on opportunity attacks) vs. AC; 1d8 damage plus 1d8 radiant damage, and the target slides 2 squares.	
⚔ Forced Detachment (standard; at-will) ♦ Psychic	
Melee or ranged 10; +12 vs. Will; 1d8 + 4 psychic damage, and the target cannot take standard, immediate, or opportunity actions until the end of the deva seer's next turn.	
⚔ Seer's Trip (immediate reaction; usable when hit by an attack; requires quarterstaff) ♦ Weapon	
Targets the attacker (if possible); +13 vs. AC; 1d8 damage, and the target is knocked prone. <i>Effect:</i> The seer can shift 1 square, and one ally that can see the seer can shift 1 square closer to the target.	
Resonant Memory (usable when the deva or an ally would fail an attack roll, saving throw, or check; recharges when first bloodied)	
Add 1d6 to the triggering roll.	
Alignment Unaligned	Languages Common
Skills Acrobatics +9, Insight +13, Religion +15	
Str 10 (+4)	Dex 10 (+4) Wis 19 (+8)
Con 15 (+6)	Int 17 (+7) Cha 16 (+7)
Equipment robes, quarterstaff	

DEVA SEER TACTICS

A deva seer engages enemies fearlessly, facilitating allies with auras and *resonant memory*. Although the deva likes to regularly use *forced detachment* to pull an enemy's attention from the battle, fighting in melee is fine too. Doing so enables the most effective counterstrikes with *seer's trip*, which is otherwise only useful for a little free movement.

DEVA DISINCARNATE

Between the world of the living and the dead, the deva disincarnate pursues clear goals until the day it reincarnates or dreams the bodiless dream again. These creatures are careful, because violence cannot destroy them, but it can force them into dreaming again and delay reincarnation.

DEVA DISINCARNATE TACTICS

When a deva disincarnate attacks, it starts off by moving among its enemies and using *psychic wave*. It then uses an action point and chooses one foe to bring into a waking dream. This foe is lost in the wonder and horror of the world's spirit lands where the disincarnate lives. Set up in this way, the disincarnate simply employs *disincarnate's fury* to maneuver and attack until it has the ability or the reason to use its other powers.

DEVA CATSPAW

The deva catspaw is caught between wicked existence as a deva and reincarnation as a rakshasa. Serving as an ally to the worldly fiends who will one day be allies, this deva has betrayed all the deva race stands for.

Deva Disincarnate	Level 11 Elite Controller
Medium immortal humanoid (undead)	XP 1,200
Initiative +10	Senses Perception +15; truesight 1
HP 160; Bloodied 80	
AC 24; Fortitude 23, Reflex 24, Will 24	
Resist insubstantial	
Saving Throws +2	
Speed fly 6 (hover); phasing	
Action Points 1	
Ⓢ Disincarnate Touch (standard; at-will) ♦ Psychic, Radiant +15 vs. Reflex; 2d4 + 5 psychic and radiant damage, and the target cannot make opportunity attacks against the deva disincarnate until the end of the deva disincarnate's next turn.	
Ⓢ Spirit Roots (standard; at-will) ♦ Lightning, Radiant +15 vs. Will; 1d8 + 5 lightning and radiant damage, and the target is slowed until the end of the deva disincarnate's next turn.	
⚡ Disincarnate Fury (standard; at-will) The deva disincarnate makes two basic attacks, or it shifts 3 squares and makes one basic attack before or after shifting.	
⚡ Waking Dream (standard; recharges when no target is affected by this power) ♦ Psychic +14 vs. Will; 1d8 + 5 psychic damage, and the target is dominated until the end of the deva disincarnate's next turn. <i>Aftereffect:</i> The target is dazed (save ends).	
⚡ Psychic Wave (standard; recharge ⓈⓈⓈ) ♦ Psychic Close burst 3; targets enemies; +14 vs. Fortitude; 3d6 + 5 psychic damage, and the target is pushed 3 squares and knocked prone.	
Salient Memory (when the deva disincarnate would fail an attack roll, saving throw, or check; recharges when first bloodied) Add 1d6 to the triggering roll.	
Alignment Unaligned	Languages Supernal
Skills History +17, Insight +15	
Str 8 (+4)	Dex 14 (+7) Wis 21 (+10)
Con 18 (+9)	Int 20 (+10) Cha 16 (+8)

DEVA CATSPAW TACTICS

The deva catspaw prefers to take foes unaware, whether through guile or stealth. Striking when close to opponents, the deva opens with *betrayer's lunge*, tackling and stabbing an enemy from hiding or after surprising that target. The deva uses *faceless* on its next turn, fading from view and memory to perform

betrayer's lunge again on the next turn. Only if the deva cannot repeat this process, or another need arises, does he or she use other powers.

ENCOUNTER GROUPS

A deva seer travels the world and its echoes in search of knowledge, listening to the spirits and discerning illusion from reality. Along the way, the deva also explores different ways of living among differing creatures. This encounter group finds the deva seer among the fey, probably at a sacred site.

Level 9 Encounter (XP 2,000)

- ♦ 1 deva seer (level 8 controller)
- ♦ 1 eladrin fey knight (level 7 soldier, see *Monster Manual* page 102)
- ♦ 1 flameskull (level 8 artillery, see *Monster Manual* page 109)
- ♦ 2 satyr rakes (level 7 skirmisher, see *Monster Manual* 228)
- ♦ 1 unicorn (level 9 skirmisher, see *Monster Manual* 257)

This next encounter group shows a deva catspaw in the usual place—among rakshasas prepared for battle. Among disguised rakshasas, the deva works to strengthen the ruse, lulling enemies into a false sense of safety before any conflict starts. Such a team could also work as a strike squad or guardians of a site that rakshasas value.

Level 15 Encounter (XP 6,400)

- ♦ 1 deva catspaw (level 15 lurker)
- ♦ 1 rakshasa archer (level 15 artillery, see *Monster Manual* page 216)
- ♦ 1 rakshasa assassin (level 17 skirmisher, see *Monster Manual* page 217)
- ♦ 2 rakshasa warriors (level 15 soldier, see *Monster Manual* page 216)

Deva Catspaw	Level 15 Lurker
Medium immortal humanoid	XP 1,200
Initiative +14	Senses Perception +15
HP 114; Bloodied 57	
AC 29; Fortitude 26, Reflex 27, Will 28; +1 to all defenses against bloodied enemies	
Resist 12 necrotic, 12 radiant	
Speed 5	
Ⓢ Retractable Katar Gauntlet (standard; at-will) ♦ Weapon +20 vs. AC; 2d6 + 3 damage (crit 15 + 1d6), and ongoing 5 damage (save ends).	
⚡ Betrayer's Lunge (standard; requires combat advantage; at-will) ♦ Weapon +20 vs. AC; 3d6 + 3 damage, ongoing 10 damage (save ends), and the target is knocked prone.	
⚡ Kinslayer Dart (standard; at-will) ♦ Psychic, Radiant, Weapon Ranged 10; +18 vs. Reflex; 2d6 + 3 psychic and radiant, and ongoing 5 psychic and radiant damage (save ends).	
⚡ Faceless (standard; at-will) ♦ Charm, Illusion Close burst 5; +18 vs. Will; the deva catspaw is hidden from the target until the deva catspaw attacks. <i>Effect:</i> The deva catspaw can shift 2 squares, including through enemy spaces, and is subject to no attacks for doing so.	
Killer's Memory (when the deva rolls a 19–20 on an attack roll against a target granting the deva combat advantage; at-will) If the attack hits, it is a critical hit.	
Alignment Evil	Languages Common
Skills Bluff +18, Insight +14, Stealth +15	
Str 16 (+10)	Dex 16 (+10) Wis 14 (+9)
Con 18 (+11)	Int 20 (+12) Cha 22 (+13)
Equipment leather armor, 2 retractable katar gauntlets, cloak

THE ECOLOGY OF THE DEVOURER

"Hunger is misery; a full stomach is trouble."

—Haitian Proverb

Souls are the root of all life. Whether mortal laborer, profane lich, or serene astral deva, nearly all creatures of the multiverse possess this animating spark. All, except devourers. Lacking such vital animus, these undead scour the planes, glutting their impossible hunger in an endless blasphemy against all the laws of existence.

HISTORY OF THE DEVOURER

Githyanki life ends in one of three ways: death in combat, execution by mandate of cruel racial laws, or sacrifice to Vlaakith, their dreaded Lich-Queen. Beyond service and glory in battle, there is little future for the servants of the

githyanki empire. Even the most successful and skilled must eventually submit to the "ultimate honor," their souls consumed by the Lich-Queen to fuel her profane immortality. Such is the way of the githyanki—a bleak, hopeless march to glories few survive to see. Those who rebel are hunted with the utmost prejudice.

In the sixth century of the last Vlaakith's rule, a cunning warlock named Xinfyrit rose through the ranks of the Lich-Queen's legions. The intense warlord became a hero to his people, leading his armies to victory after hollow victory at the Lich-Queen's whimsy. Drove of sycophants flocked to the warlock, and any who survived his rigorous testing gained places as his apprentices. Buying his armies' loyalties with the spoils of conquered worlds and promises of eternal glory, Xinfyrit's legions became more akin to cults of devoted followers. Yet the

ambitious general had no care for his supporters nor his race's great empire, only for personal power and complete control—goals directly impeded by the continued existence of the Lich-Queen herself. Thus, subtly, Xinfyrit's popularity became the seeds of rebellion.

Yet Vlaakith was not blind, and the ageless queen was intimate with the ways of deception and rule. Upon returning to Tu'narath after the purging of a world-spanning illithid enclave, Xinfyrit was publicly beckoned to the Lich-Queen's palace, Susurrus, to receive the Great Reward, the consumption of his very soul—a high honor. Graciously accepting, the general and an escort of his finest apprentices and knights entered the Palace of Whispers, intent on murdering the githyanki queen in a bloody coup. Just as Vlaakith expected.

The resulting battle devastated Xinfyrit's forces, and only by sacrificing the vast majority of his troops did the warlock and his closest apprentices manage to escape to the depths of the

KNOWLEDGE OF THE DEVOURER

The following table shows the results of a Knowledge (religion) check as it relates to devourers. A Knowledge (the planes) check might reveal the same information, but the check DCs are always 5 higher. Information about devourers is most likely to come from a planar scholar, loremaster, or githyanki. The devourer appears on page 58 of the *Monster Manual*.

Knowledge (religion)

DC	Result
21	The creature you face is a devourer, a powerful undead being from another plane.
26	Devourers can drain life force from a distance and can trap and consume a creature's very soul. This soul energy fuels a variety of death-related magical abilities.
31	Devourers are resistant to magic and, when bearing an imprisoned soul, are immune to numerous magical effects.
36	A devourer can only consume one soul at a time. As long as a figure appears within its ribs, it won't try to devour another. If no such figure is visible, it doubtlessly hungers for a new soul to feast upon.

Astral Plane, pursued by the Lich-Queen's most zealous champions. The renegades' flight took them far and lasted six grim years, but finally they were captured by Vlaakith's agents, their souls stripped and shackled within black gems, their bodies left

to drift in the far-flung reaches of the Astral Plane.

Xinfyrit's rebellion did not end so quietly, though. Eventually, the husk of the githyanki rebel drifted near a color pool of fathomless onyx. Infused by astral winds and emanations from

the Negative Energy Plane, Xinfyrit's soulless, plane-warped form reanimated with full memory of his death and a hungry emptiness unlike any he had ever known. Not fully understanding what had happened, the deathless warlock resurrected his apprentices in the aura of the black color pool and, together, they plotted their revenge and an attempt to reclaim their stolen souls. Thus, the first devourers were born.

Untold numbers of shocked githyanki died in the devourers' assault on Susurrus, their souls fueling newly discovered and even greater powers among the undead. In the end, Vlaakith and Xinfyrit did battle over the corpses of their followers. It is unknown who fell, but during this decade the current Lich-Queen took a vacant throne (the exact span of a Vlaakith's reign being purposefully obscured). As Xinfyrit did not take control of the githyanki empire, it seems unlikely that the newly spawned devourer was victorious, though his fate remains unknown even to this day. What is known is that several of Xinfyrit's devourer apprentices escaped their second attack on the Lich-Queen without their souls, fleeing into the Astral Plane, the Ethereal Plane, and beyond. Though his coup failed, Xinfyrit's rebellion brought a dreadful realization to the githyanki race, a newly-realized choice in regards to death: that their lives can end in either pain or in horror.

PHYSIOLOGY OF THE DEVOURER

As undead creatures, devourers do not have a functional physiology and have no place within the natural environment. Although they do not age, sleep, or reproduce, they do hunger. Devourers are literally soulless husks motivated by the hate-filled echoes of their living memories. All devourers seek to reunite with their lost souls, whether that essence be held prisoner somewhere

or has departed to the Outer Planes. To fuel their hunt, and any of countless insidious schemes they might concoct to regain their essences, devourers temporarily sate their infamous hunger with the stolen souls of other creatures. Such souls are consumed, digested, and ultimately annihilated, denying their victim any form of afterlife.

Should a devourer ever regain its soul or attain proof positive assurance that its soul has been destroyed, it is unknown what might occur. Many scholars posit that, if a devourer frees its captured soul, the abomination would simply die, the soul departing to the proper Outer Planar realm. Others, though, contest that any creature tenacious enough to cling to existence—even without a soul—would not be content to pass on and, upon completing or finding its quest fruitless, would likely succumb to madness, becoming an even greater terror upon the planes.

Although the first devourers were doubtlessly spawned of the githyanki race, devourers of other races have likely formed. The method by which devourers are created remains unclear but seems to rely upon three elements:

a body killed by the draining of its soul, energies from the Negative Energy Plane, and a third mysterious animating force. As the first devourers animated on the Astral Plane, some source there unquestionably provides the requisite vim, perhaps the astral winds, influences of countless planar energies, or the echoing memories of the dead gods floating in the astral depths. The ghostly energies of the Ethereal Plane and sinister emanations of the Plane of

Shadow both also make those transitive planes fertile grounds for the creation of devourers. These strange energies cause a variety of unusual alterations in a devourer's physical (and possibly mental) state—including hastened desiccation, the visible collapsing of the corpse's chest cavity, and an increase in size.

Despite the unusual nature of some of the requirements necessary for a devourer's animation, the most important is a body with a fundamental will to survive, even beyond the removal of its soul. As these terrible corpses fuel their selfish hunts with the destruction of other living souls, only bodies inspired by the thoughts and willpower of the most evil individuals arise as devourers. Hypothetically, a devourer could also arise from a body whose soul was removed and has since passed onto the Outer Planes. Such a departed soul might be wholly unaware of the reanimation of its body. Few things are more terrifying than the prospect of a soul that's passed on to its eternal reward being hunted by its endlessly hungering corpse.

PSYCHOLOGY AND SOCIETY OF THE DEVOURER

To understand devourers, one must understand their hunger. As the creatures possess no souls, they are victimized by a yearning perhaps no other creature in existence understands. They are incomplete, and the very laws of existence implant their unnatural animate forms with the fundamental

DEVOURER PLOTS

Devourers are insidious in their methods and plots to regain their lost souls.

To Consume a God: Rakis-Ka has come to the ruins of an ancient aboleth city, Golismorga, hoping to gain increased insight and power by feasting upon the essences of one of the aquatic race's ancient, unfathomable gods known as the Elder Evils (see "The Lightless Depths," in *DUNGEON* #144).

Corruptor: A bargain with a dark religion left Radraz'im the guardian of an unholy relic known as the *cauldron of corruption* (see "Tears for Twilight Hollow," in *DUNGEON* #90). The devourer was told the exact location of his soul but is magically compelled to guard the cauldron for 10,000 years or until it has spawned ten thousand undead. Thus, he tempts any creature who discovers the cauldron to raise legions of undead servants—not mentioning his power to control such horrors.

Soullessness: An ancient, abandoned githyanki fortress is rumored to be a lost storehouse of imprisoned souls and is haunted by undead githyanki call *kr'y'izoth*, the result of necromantic experiments by the Lich-Queen herself (see "The Lich Queen's Beloved," in *DUNGEON* #100).

What's not known is that the devourer Drazramml is the one spreading these rumors, intent on interrogating and consuming any creature attracted by such tales. Although the other resident undead are free willed, the devourer has subjugated them into working for it.

Undead Revenge: The devourer Omaz'vrii has awakened a legion of undead heretics and compelled them to attack a nearby temple. As his undead warriors deal with the temple's faithful, the devourer scours the catacombs below, seeking to corrupt a relic capable of summoning back the souls of the departed.

drive to correct the grievous wrong. Thus, devourers temporarily sate this yearning with stolen souls. While a devourer suffers no perceivable hindrance for not having a trapped essence, the longer one goes without a soul to feed on the greater its sensation of hunger grows. A devourer is driven to feed within hours of losing a trapped essence and is nearly mad with hunger in a matter of days. Although smart enough to avoid suicidal efforts to garner food, a starving devourer is increasingly willing to take risks for a worthwhile soul to devour. While they can burn the essence of simple beasts or even other undead, only the "taste" of thinking, living creatures can sate their unliving hunger for long.

As most devourers actively scour the planes for their lost souls, these undead are nomadic hunters, most often encountered on the Transitive Planes as they roam from world to world. When encountered on the Material Plane, they are most commonly hunting for souls, searching for clues as to their souls' whereabouts, or in the midst of some plot to reveal their essences' locations. Often being quite intelligent, devourers are able to see the benefits of allying with living creatures. Powerful clerics, sorcerers, and wizards, especially those with potent divination magic or the ability to question deities, prove most helpful to devourers, as such magic-users might aid in locating their souls. Alliances with mortal

spellcasters rarely end well, however, as impatient and unstable devourers are quick to let their anger and hunger take hold at the slightest delay or failure. As such, devourers are most comfortable in the presence of outsiders and other undead, creatures whose souls are fundamentally different from those for which they hunger. Some githzerai have come to surprisingly beneficial agreements with the eldest devourers, possibly the apprentices of Xinfyrit's rebellion. These monks employ devourers as guardians of monasteries in Limbo, feeding the undead horrors a steady stream of souls from captured githyanki as they meditatively search for the creatures' lost essences.

Even when temporarily taking up residence somewhere, devourers do not surround themselves with symbols of death. Indeed, those seeking them are less likely to find devourers in a crypt than a forest. Devourers want to be where the living are, and thus they avoid places shunned by their meals. They most often lair near communities or major trade routes, luring mortals to secluded places

using their *suggestion* ability. Fortunately for all living creatures, though, devourers are not gluttons and are driven ever onward by their searches. Thus, unless a devourer believes its soul is hidden nearby, its incursion is likely short and its victims few.

If forced into battle or facing a victim more powerful than it expected, a devourer with a trapped essence uses its spell-like abilities freely, confident it can trap a new essence as soon as the current one is expended. In fact, consuming its current essence quickly makes its most powerful attack—trap essence—available sooner. If it has time to prepare, a devourer casts enough spell-like abilities to leave its trapped essence nearly depleted. It can use its *spectral hand* ability to deliver both a touch attack, such as *ghoul touch*, and its own energy drain, as a single attack. Once a foe has been energy drained several times the devourer moves on to a new target unless it needs to feed. A devourer facing numerous armored opponents tries to catch as many as it can in the area of its *confusion* ability, hoping to reduce their effectiveness. In the aftermath, a devourer can “smell” the most powerful soul, burning any essence already trapped for a more savory meal.

DEVOURER ALLIES

Typically, devourers have no treasure because they have no lairs nor do they need to linger in one place for long. Any treasure a devourer gathers from its victims is quickly used to pay off vile creatures summoned with its *lesser planar ally* spell-like ability. Although devourers spend no experience points when using this ability, they must take 10 minutes to use it and pay their summoned ally for services as outlined in the spell description. Obviously, a devourer rarely has a spare 10 minutes during a combat to call for help, but one planning an attack or knowing it's being hunted is a different matter. A devourer able to gather as much treasure as a monster of its CR typically carries could pay one 6 HD planar ally to serve in a series of raids taking up to 12 days or three 5 HD planar allies to serve for a task taking up to 11 hours.

For multi-day attacks devourers typically favor a bearded devil (6 HD) to serve as a bodyguard and shock trooper, with the devil entering a battle frenzy to hold stronger foes at bay while the devourer consumes a weaker target. A devourer seeking to infiltrate a town might summon a succubus to gather information for it or lure victims from the relative safety of civilization. Alternatively, a devourer simply needing muscle for a single raid most often summons three xill for 11 hours. While the xill aren't as dangerous in combat as the devourer itself, their ability to make four attacks a round, paralyze, and planewalk allows them to deal with numerous lesser foes (or gang up on one powerful enemy), freeing the devourer to focus on one victim.

Devourers also often use other undead as allies, especially ghosts and wraiths. They work well with ghosts, as those undead only want to feed on the dead and devourers feed on the living. Should doing so suit their plans, devourers might establish control over packs of lesser undead with *control undead*. More powerful beings sometime employ devourers to act as commanders of lesser undead.

Devourers rarely ally with one another, unless the same event spawned them both. Otherwise, their goals prove too divergent to weather a competitor with the same hunger.

ALTERNATIVE DEVOURER ORIGINS

Little enough is known about devourers that a DM could give them origins more appropriate to a specific campaign. A few possible optional origins are outlined below.

Missing Mortality: The transition from life to lichdom is fraught with peril. A powerful spellcaster seeking to make the transformation into undeath unleashes potent magical forces as he attempts to transition his soul to a phylactery. Should he lose control of these forces, the soul-laden phylactery might be flung to some random corner of the multiverse, cursing the spellcaster to an existence as a devourer.

Ravenous Genesis: Devourers are created when a barghest is killed by ghoulish fever contracted from a ghast. The devourer inherits the hunger of both creatures, although it remembers little of its former life.

Soul Reapers: A few senior clerics of Nerull have access to a ritual that can turn anyone who died of starvation into a devourer, although they refer to these undead as soul reapers. The ritual cannot be performed on the Material Plane, resulting in devourers being native to the Astral and Ethereal Planes.

ADVANCED DEVOURER

Shivra of the gish caste was one of Xinfyrit's first apprentices, a sorcerer of great skill but possessed of a deep-rooted fear of dying. Hoping to free herself from the Lich-Queen's inevitably fatal edicts, the githyanki spellcaster stood with her master when he attempted to overthrow Vlaakith, fled with him to escape the tyrant's wrath, and ultimately died by his side. When Xinfyrit and his minions returned to Susurrus as devourers, it was Shivra's mission to locate and confiscate the stolen souls of the newly spawned devourers. Before their assault was turned back by the Lich-Queen's forces, Shivra discovered that the Lich-Queen had not consumed their souls, but rather had sent the black gems to some hidden githyanki holding on a back-water Material-Planar world. Escaping the Palace of Whispers with this information, the devourer now hunts the planes seeking more clues, both to the location of her soul and regarding the survival of her master, Xinfyrit.

Possessions *wrappings of armor* +5 (as *bracers of armor* +5), *ring of blinking*, *ring of force shield*

Energy Drain (Su) Living creatures hit by Shivra's claw attack or *spectral hand* ability gain one negative level. The DC is 26 for the Fortitude save to remove a negative level. The save DC is Charisma-based.

Trap Essence (Su) Shivra can consume an enemy's life essence. To do so, she must forgo her normal melee attacks and make a trap essence attack. This requires a normal attack roll but deals no damage. The affected creature must succeed at a DC 28 Fortitude save or die immediately. The save DC is Charisma-based.

A slain creature's essence is trapped within Shivra's ribs, and the figure takes on that victim's features. The trapped essence cannot be raised or resurrected, but a *limited wish*, *miracle*, or *wish* spell frees it, as does destroying Shivra. Shivra can only hold one essence at a time.

The trapped essence provides Shivra with enough power to use five spell-like abilities for each Hit Die or level of the trapped creature. As this energy is expended, the twisted soul fades away until it evaporates completely. The trapped essence gains one negative level for every five times Shivra uses one of her spell-like abilities. When the essence's number of negative levels equals the creature's total Hit Dice or level, the essence is destroyed. If an essence is freed, the restored creature must succeed on a DC 28 Fortitude save for each negative level or lose that level permanently.

Spell-Like Abilities At the start of any encounter, the trapped essence within Shivra is assumed to have 5d4+3 levels.

Spell Deflection (Su) The trapped essence provides a measure of magical protection. If any of the following spells are cast at Shivra and overcome her spell resistance, they affect the imprisoned essence instead: *banishment*, *chaos hammer*, *confusion*, *crushing despair*, *detect thoughts*, *dispel evil*, *dominate person*, *fear*, *geas/quest*, *holy word*, *hypnosis*, *imprisonment*, *magic jar*, *maze*, *suggestion*, *trap the soul*, or any form of charm or compulsion. In many cases, this deflection effectively neutralizes the spell. Some of these effects might eliminate the trapped essence, depriving Shivra of her spell-like abilities until she can consume another victim. ■

The ecology of the displacer beast

by Bill Mickelson

The following was taken from the lecture notes of the mage and naturalist Jen-Ahb, after he was mauled to death by a rogue displacer beast in the bestiary of the University of Sarkawan.

The displacer beast is a magical creature that resembles a large black panther, save for its six legs and the pair of horned tentacles sprouting from its shoulders. Its name derives from its ability to appear up to a full yard away from its actual position, caused by subtle vibrations emitted from its flesh that apparently refract light to distort the beast's apparent location. This enables the beast to avoid most initial attacks, which are directed at the illusionary form which usually appears closer to the attacker. From this power and from their own stamina, ferocity, and lighting skill, they are also highly resistant to magical effects, poison, and attacks that may be dodged (such as a dragon's breath). They are devilishly hard to kill.

In order to learn more about these strange creatures, I had to capture one alive — a task made most difficult by their rarity. What few displacer beasts there are prefer to live in the deep wilderness — in old forests, mountains and hilly regions, on vast plains, and even in the desert. Occasionally a pack of them is found in a swamp. The swamp variety tends to be somewhat larger than other sorts and swims very well. It is especially dangerous because of these facts, and because the swamp provides excellent cover for ambushes.

I was able to obtain a grant from our lordship and a leave from this university to obtain a specimen of this creature for study. I gathered a force of porters and armed men and proceeded into the Broken Spire country, where we searched for three weeks. Finally, we sighted a large male displacer on a mountainside, and one of my more zealous followers cast a net at the beast — missing, of course. It then ran off with incredible speed, apparently without using its front legs for travel. The beast looked for a few moments like a feline centaur.

After a few more luckless days, we were blessed to come across a displacer beast cave, which I identified at once by the abrasions left on the cave mouth from the beast's habit of sharpening its claws and tentacles on bare rock. Realizing our danger as well as our fortune, I deployed the twelve mercenaries with us about the cave in pairs, arming them with short swords as well as their nets. Two of my assistants

What you see is not what
(or where) you hit

carried long darts, especially prepared with a sleeping venom approved by the Council of Scholars and our lordship for use against rogue creatures who share no humanity.

Having prepared my spells and said my prayers to the gods and the university's alchemical staff (who had mixed the sleeping venom), I gave a signal and every man present gave out a roaring shout. We abruptly discovered, as the displacers emerged, that we had found a family lair. An enormous male, purple-black in color, a smaller female of blue tone, and two cubs rushed forth. My amazement could only be imagined, as no young displacer beasts had ever been known in these lands, and it had been assumed that such creatures were somehow generated full-grown. I was barely able to recover myself to raise the iron nail in my hands and speak the words to the spell of holding. The mercenaries hurled their nets at the male, almost forgetting about the rest of the pack in their haste to bring down the greater threat, and chaos

reigned for the space of perhaps a minute.

Merciful are the gods of the university, and wise are the old men in the alchemical department! At our moment of greatest peril, the male beast's natural resistances failed him as the iron nail vanished from my hands and the male displacer vanished — only to reappear several feet away, flat on the ground, paralyzed! Only one of the many nets hurled had even struck him, entangling his horned tentacles and perhaps sparing the life of a soldier that the beast had begun to maul. The soldier himself was caught by the spell, but was no worse for the experience and was quickly treated by Brother Synon of Saint Ardan's, who accompanied us. The blue-black female succumbed to a dart from one of my aides, and the cubs were quickly netted as they tried to escape.

A marvelous find, I must admit. The male was huge, measuring 11' from nose to tail, with 7' tentacles. It weighed in at about 600 lbs. The female was quite a bit

smaller, only about 8' long and 450 lbs., but was in excellent health. Each cub was about the size of a large housecat, but lacked the characteristic tentacles, having only knobby growths instead. In captivity here at the university, the cubs quickly developed their adult size and appearance within a matter of weeks. Their growth rate was astonishing. It appears that they reached full maturity at the ripe old age of four months.

The displacer beast's claim to fame is, of course, its power to appear 3' away from its actual location. The sage Dunmeyer has written extensively of displacers, though he had not studied live ones, and he once conjectured that his remarkable effect was somehow caused by molecular vibrations. Until I was able to shed new light on this mystery, anyone else could do nothing but guess, though my research is far from complete itself. It seems now that the molecular vibrations, stimulated by a specialized group of nerves, occur only in the outer layers of the beast's skin cells. Where as the vibrational movement is too minute to be normally noticed, it is sufficient to bend and redirect the rays of colored light. The refracted light rays form the illusionary image while the true form is masked, virtually invisible. This magical power is automatic, but it may be consciously directed by the beast itself.

It is still unknown, even to me, precisely how the light rays are deflected by the vibrations. Due to the beast's magical nature, I would not be at all surprised if the supernatural had a fair hand in the origin of the talent. Interestingly enough, displacer beasts are able to see each other's true forms and are not deceived by displacing — in fact confirmed by watching them in captivity.

Although only full-grown displacer beasts are found in packs outside the lair, obviously there are young. They never leave the lair until they are full-grown or the family moves to another locale. It seems as if the beasts do not want the young to be out before their displacing talent has been acquired. As violently disposed as they are to other creatures, they do not fight among their own species and exhibit no sense of rivalry among themselves, except for the play of young cubs. This playful behavior vanishes with adulthood. I am currently attempting to familiarize one of the grown displacers in the bestiary to my presence, though without much success.

Given the observations of other explorers who have recently visited the Broken Spires on other quests, we have a more complete picture of the life of the average displacer beast. Lairs contain two adult displacer beasts — male and female, of course — and perhaps as many as four cubs, though usually only one or two are produced. The birth rate among displacers appears to be quite low, given their small numbers. Little is known about their mating or birthing procedures. Unlike most carnivorous mammals, displacer cubs are born with their eyes open and a set of usable teeth for eat-

ing meat right away. Adult females have mammary glands and nurse their cubs until they leave the lair at the age of four months. Newborn kittens have no tentacles and are about the size of small housecats, though after the first eight weeks their tentacles sprout and grow at the rate of an inch or so a day until after about 30 days more have passed. At this time, the cubs will measure close to 4½' long, weigh near 90 lbs., and generally be the same size as a large lynx. At the end of the first year, length and weight will be approximately 7½' and 350 lbs., respectively.

From then on, the length of the tail will be around one-third of the overall body length, and tentacles will typically equal half the total length. When the beast reaches full maturity after two years, 10' is average length for a male, with 9' being the norm for females. Weight is about 500 lbs. for males, females 450. The extremely fast growth is even more impressive when one stops to consider that the beast's average lifespan is perhaps close to 100 years.

Distantly related to the true cats, the displacer beasts hunt in a similar fashion but often for more powerful game, such as giant deer, boars, cattle, buffalo, bears, and (as every child knows) blink dogs. They move silently until within striking distance for a lightning-fast attack made by several adults at once. They generally use only their tentacles, but their fangs and talons may be brought into play in close combat. Though they walk at a quick pace on all six legs when fighting or running, they raise their forelegs to claw at victims if they so desire and can run on their rear four legs without difficulty.

Displacer beasts can leap 20' straight up, 25' across on a standing jump, and double that on a running jump. Unlike many other creatures with more than four legs that have slow metabolisms, the displacer beast can move with great speed and with high dexterity despite the extra pair of legs that might get in the way.

I regret to say it, but a great many of those who have followed my work care little about my discoveries on how the displacer beast hides its form and creates an illusionary one, being more interested in the creature's violent temperament. "Why are they so vicious around blink dogs?" is the most often-asked question that comes from visitors to the university bestiary. Indeed, the murderous fury of a displacer beast is fit only for nightmares, of which I had several after our successful hunting expedition. Not being especially intelligent or cunning, displacers are not subtle when they burst into attack. They have been seen to maul any beast that comes within striking range of them, from humans to small dragons, and rumors abound of howling battles between some large carnivore and a hungry pack of displacers, shrieking and screaming their fury as they savagely tear their prey to shreds.

I know of few things to compare such madness to in the animal kingdom, not

even excepting the behavior of certain berserkers and were-beasts. I have evidence that some process connected to their maturation, likely a growth hormone, affects their minds as they go from amiable kitten to adult killer. From the moment that the tentacles of the two kittens we had captured began to grow, the kittens became irascible and violent. I have scars on my left arm from wounds caused by Emerald Fire, the larger of the pair, that have only recently healed. This terrible nature only grows worse over time, though, as I've said before, they will not attack their own kind. Perhaps the scent of one another is the key element in preventing these attacks; I cannot say, though I have further experiments planned.

As foul-tempered as it is, the displacer beast reserves its most intense hatred for blink dogs. There seems to be a particular reason for this, as my research has shown, but the explanation was hard to come by. The two species both prefer temperate climates, but the displacer beast usually lives in the forests and mountains, whereas the blink dog is generally a creature of the open plains, so there are no territorial disputes or fights over prey on a species-wide basis. The "dog-and-cat" hypothesis holds no water here, as you might guess, since cats and dogs are not enemies by nature.

My explanation is based upon prolonged experimentation (and the deaths of several blink dogs). The very actions of displacement and blinking seem to interfere with the nervous and mental systems of the opposing creatures. I have seen a blindfolded displacer beast jump and yowl when a blink dog was allowed to teleport itself within several feet of the former's cage. The blink dog, in turn, began to snarl and bark in the direction of the displacer even though it, too, was blindfolded, had its sensitive nose covered, and was within the area of a spell of silence. Detection of the other is automatic for each, and appears to trigger hate, ferocity, and violence in both animals, especially the displacer beast, whose special nerves are spread throughout its entire body. This occurs whenever the creatures are within 150' of one another.

Even if the blink dogs are not using their power or if the displacer beasts are asleep and not using theirs, both have learned to identify the other by scent and sight, provoking automatic flight or attack, depending upon the circumstances. Both species can also detect the approximate location of their enemy should their respective special powers be brought into play, and some rather sophisticated wild blink dogs have learned to not use their powers when preparing ambushes for the displacers. Blink dogs get a general feeling for the direction in which a displacer beast lies, but the displacers can find a blink dog as soon as it blinks in with unfailing accuracy.

As a side note, I would be curious to learn the effect upon a blink dog of wearing one of those remarkable displacing cloaks that adventurers talk about. I would wager

that being caught by a pack of the creatures would not be a pleasant experience!

A truly unique and interesting creature, the displacer beast. I am more than happy to spend the rest of my life studying it.

Appendix

1. To determine the orientation of a displacer beast and its illusionary form, roll d10. On a result of 1-5, the illusion is in front of the creature (positioned between the creature and an opponent it is facing). On a roll of 6-7, the illusion is to the creature's left; 8-9, to the creature's right; and on a roll of 0 (10), the illusion is behind the creature's actual position.

2. A lone opponent facing a displacer beast has a -2 penalty "to hit" on any occasion except when the displacer beast has scored a hit earlier in the current round of combat. If more than one opponent is involved against a single beast, additional foes have their "to hit" penalties reduced by 1 for each extra foe involved: the second opponent hits at -1, and the third and all subsequent opponents have normal chances to hit. (This assumes that the multiple opponents have arranged themselves so as to partially or entirely surround the creature.) If a beast is hit by any attack against it in a given round and it does not move, then all opponents who viewed the successful hit can attack at no penalty in the following round. Infravision will reveal the actual location of a displacer beast, as will *true*

seeing or other similar magical means.

3. Displacers rarely use their claws and teeth unless near death or fighting a very large opponent. Each claw attack does 1-6 hp damage, and each bite 2-12 hp damage. Such an attack routine involves two tentacles, two claws, and a bite, though it can claw with the middle and rear pairs of feet as well if it can leap down upon an opponent or attack a prone one. Very large beasts will also be attacked with all available clawed feet.

4. When it is running on four legs, the beast's movement rate is doubled (30") for 3-12 rounds.

5. Attacks for immature displacer beasts are as follows: Treat those 1-4 weeks in age as a normal cat (*Monster Manual II*, and those 5-8 weeks old as a wild cat. The growth spurt begins here, so those kittens from 9-12 weeks old attack as a lynx (with the middle set of claws doing 1-2/1-2 on rakes), but cannot use their tentacles effectively (1-4/1-4 for attacks in the 11th and 12th weeks). Attacks between claws, teeth, and tentacles are evenly divided at this stage. As the cub grows older, it comes to rely heavily upon its tentacle attacks, using them as whips. Displacers 13-16 weeks old attack as adults, using their tentacles to cause 1-6/1-6 damage. Attacks are normal at the end of the first year. Those kittens under one week old have no effective attacks.

6. Although listed as neutral in align-

ment, some displacers have truly evil natures, and this will show up in *detect alignment* spells.

7. Blink dogs will attack anyone wearing a *cloak of displacement* with great ferocity. Displacer beasts, however, are not bothered by those who cast the spell *blink* upon themselves. The cause for the latter's distress lies in the magical biology of the blink dog, not in the nature of the spell itself.

8. A displacer beast's illusionary form is not like a regular illusion, in that it is not dispelled upon contact and it cannot be "disbelieved" out of existence. Striking the illusionary form will not reveal the actual location of the beast, but will of course reveal the illusion for what it is.

SOME REFUSE TO DIE

in the AFTERMATH!

AFTERMATH! is a role-playing excursion into a post-holocaust world for 2 to 6 players and a referee in search of a different kind of adventure

- Basic Rules book with multiple examples of play.
- Players' Handbook detailing character generation, equipment, and life after the Ruin.
- Referee's Handbook detailing construction of the environment and running the game.

AFTERMATH! provides for modern firearms, NBC weapons and protections, mutations, survival, high technology and more. The game is structured to allow the referee to decide the nature of the holocaust that destroyed civilization in the world in which play will occur. The boxed set also includes an introductory adventure, character sheet, and judge's screen with the three volumes of rules. AFTERMATH! is a step forward in the art of role-playing games. **\$24.00**

ALSO AVAILABLE:

- INTO THE RUINS: the city of Littleton. Adventures 20 years after the ruin. \$6.00
- OPERATION MORPHEUS: a university setting some 100 years after the Ruin. \$8.00
- SYDNEY: THE WILDERNESS CAMPAIGN: an entire city campaign pack. \$7.00

CAN YOU SURVIVE?

Available from better shops worldwide, or direct from Fantasy Games Unlimited at P.O. Box 182, Roslyn, New York 11576.

Please add \$2 for postage and handling. New York residents, please add appropriate sales tax.

as translated by Sammaster the Mad, circa 887 DR

The Ecology of the DRACOLICH

Who does not fear the great unknown that is the night, when spectral winds carry strange sounds from the darkness? That time when dread clutches the stomach and fear tingles along the spine of even the most stout-hearted; where every mundane shadow becomes a sinister, alien visitor. Night terrors have haunted the living since time began, and with good reason, for many imagined fears are all too real. None, though, commands the dark of midnight skies and abyssal caverns with the horror and the authority of the immortal night dragon—the dracolich. The most powerful creatures of nature and magic transformed into ever-living, undead monstrosities, they are threats to all who fall under their sway and few can flee beyond their skeletal claws.

HISTORY OF THE DRACOLICH

Many sages and magical practitioners—"experts" in the realm of dragons—claim that Falazure the Night Dragon created the first dracoliches. There might be some truth to this, considering that "night dragon" is a commonly accepted term when referring to a dracolich. As wholly unnatural, created beings, however, a common heritage is hard to trace. The origins of dracoliches are as varied as the locales in which they appear, whether they come about through the machinations of madmen and demented cults or by dragons instigating the unnatural process through their own arrogance and naked ambition.

The earliest known dracolich, the infamous Dragotha, was created from the body of one of Tiamat's favored consorts. The god of undeath, Kyuss, granted him unlife in exchange for his eternal servitude. Since then, mortal adepts have developed dim echoes of Kyuss' magics in the form of a powerful ritual accompanied by the consumption of a foul magical concoction—part poison to slay the imbiber and part elixir to bring about the cold existence of undeath—called The Damnable Libation, or more simply, *dracolich brew*.

One other commonality in the origins of dracoliches is their absolute reliance on a magical phylactery in which to store their souls. In this they parallel their humanoid counterpart in undeath, the lich. No one is sure how they came to follow this path and no other form of undead is so reliant upon such a receptacle—except perhaps vampires' connections to their coffins. Perhaps dracoliches rely upon these essential repositories for their nigh invulnerability, although

KNOWLEDGE OF DRACOLICHES

The following table shows the results of a Knowledge (religion) check regarding dracoliches. Those who study the magic of necromancy, dragons, and the most ancient of occult tomes might possess this information. A Knowledge (arcana) check can still reveal information about the type of dragon a dracolich was in life.

Knowledge (religion)

DC Result

- | | |
|----|---|
| 15 | A dracolich is a fearsome foe combining all the powerful abilities a dragon enjoyed in life with those granted by an undead existence. As skeletal beings, they are most vulnerable to bludgeoning weapons. |
| 20 | Dracoliches are formed when a dragon drinks a foul concoction called <i>dracolich brew</i> and then partakes in a vile ritual of reanimation. The complex ritual requires the cooperation of clerics and wizards in addition to the dragon. |
| 25 | Like lichs, dracoliches hide their life force in phylacteries. Only if the phylactery is found and destroyed can a dracolich be permanently slain. |
| 30 | Dracoliches are masters of the dead, possessing paralyzing abilities and mastery over lesser undead creatures. A slain dracolich can possess the body of any draconic corpse within a short distance of its phylactery. |
| 35 | When inhabiting a body other than its own, a dracolich spends a few days as a weakened proto-dracolich. If the proto-dracolich can be found during this time it is more easily destroyed and might serve as a clue to the hiding place of its phylactery. |

they trade it for extreme vulnerability at the hands of anyone who should locate their soul-storing phylactery. Perhaps this crucial vulnerability

holds some symbolic significance, such as being a representation of the Hades Pyxis, the receptacle of Fala-zure hidden somewhere within the

THE FIRST DRACOLICH

While the dracolich as a monster was introduced in 1986 with *DRAGON* #110 and Ed Greenwood's article "The Cult of the Dragon," this was not the first appearance of an undead dragon in D&D. Some 7 years earlier, with 1979's *White Plume Mountain*, an arrow pointing off the map of the mountain's environs bore a sketch of a fearsome skeletal dragon and the note, "Beyond to the lair of Dragotha, the undead dragon, where fabulous riches and hideous death await." In June 1988, this note led to William Simpson's article in *DRAGON* #134, "Lords & Legends," which presented stats for Dragotha, the one-time consort of Tiamat and a unique undead menace. Dragotha rears his deathless skull again as part of the Age of Worms Adventure Path, coincidentally in *DUNGEON* #134, with the adventure "Into the Wormcrawl Fissure."

shadowed plains of the Gray Waste and said to hold the accumulated knowledge of all dead dragons.

PHYSIOLOGY OF THE DRACOLICH

Dracoliches have no metabolism and therefore no need to eat. Old habits die hard, however, and the desire and racial hunger to consume lesser creatures might still exist. Some dracoliches still carry out the function of devouring prey, but the flesh simply falls through their rotting skeletal forms, leaving mountains of mangled corpses. Sometimes, a dracolich eats foes simply out of malice or to feed parasites that cling to its remaining flesh. A dracolich is aware that its maw makes for a fearsome weapon—what better way to make an example out of an enemy than consume him before his friends' eyes? In all other physiological aspects dracoliches follow the same path as liches, having no need to eat nor having any inescapable cravings or dependency on diets. Dracoliches are magically created and, therefore, have no ability to propagate.

PSYCHOLOGY AND SOCIETY OF THE DRACOLICH

Consider a creature that lives almost forever agreeing to its own excruciating

murder to assure complete immortality. Could it be that all dragons, tortured by the knowledge of their own transience, face this death gladly? Could their near endlessness be a living curse; the very nearness of immortality being a madness that mortal minds cannot conceive? Dare they trust those who promise them immortality in the final moments before their deaths?

Some believe that a dracolich must, by necessity, be insane: a dragon driven by such insatiable need and ego that it cannot perceive its own death and is willing to go to any lengths to avoid it—including the tortuous ritual of death followed by an appalling undead rebirth. Others say that lichdom is something most dragons some day strive for, as the thought of their own mortality is unbearable to such narcissistic creatures. Perhaps they are to be pitied—creatures so unable to face rest that they willingly go to any lengths to avoid it, so fuelled by greed and desire that they cannot conceive of such hungers ending. Avoiding death becomes an obsession, a need so great that it causes them to face their own agonizing poisoning to achieve it.

Dracoliches, as creatures of great intelligence, are consumed by needs and quests, driven by the knowledge

that one day they will succeed in all their goals and face the ultimate terror of torpidity. They are thus creatures of great distraction, able to juggle a thousand plots at any time, almost needing to do so. They are also, therefore, many things to many people: a tyrant ruling a kingdom, a benefactor to sages engaged in unfathomable studies, a fearsome battle lord conquering vast territories, and a terrible legend. Uniquely driven, dracoliches are terrible creatures indeed, sometimes seemingly mad in their goals and desires—which are almost as endless as their own lives.

When two or more of these ferocious, proud, and terrible creatures meet, such engagements frequently end in one's destruction. A dracolich is a terrifying foe, and other dracoliches rightly avoid their own kind for fear of being matched. As such, they use their ancient cunning to lure others to do their dirty work for them, spreading rumors of boundless treasure along with their opponents' possible weaknesses, all the while doubling and redoubling their already obsessively thorough defenses.

PHYLACTERIES

The one true weakness of a dracolich is its phylactery. As the destruction of this relic spells calamity for its draconic owner, a dracolich obsesses about its phylactery and weaves plots of astonishing complexity around its whereabouts. The destruction of a kingdom or loss of a hoard means nothing to the dracolich compared to the safety of its precious soul.

Dracoliches thus devise an amazing array of lies and ruses, rumors, false leads, and fakes to prevent their true phylacteries from falling into the wrong hands. Alternatively, some dracoliches prefer to keep their phylacteries with them—cunningly hidden beneath the strongest metals, or held within their form—sometimes melded to appear like parts of their own skeletal bodies. Other dracoliches prefer more obvious approaches, like horrendously trapped dungeons guarded by the toughest

monsters. Some prefer the double bluff approach—hiding their phylacteries in places so obvious that no one would think to find them—wreathed beneath protection spells within a cathedral, for example, or perhaps built into the foundations of some huge civic building in the center of a city.

Phylacteries are as unique as the dracolich to which they belong; examples include sheets of paper-thin iron covered in sigils and bizarre illustrations, a length of horn from some impossible creature woven into an incredible knot of rune-inlaid ivory, or a stone puzzle-box with a hundred different possible shapes. Regardless of how a phylactery looks, most possesses the same statistics—a Tiny object with 40 hp, hardness 20, a break DC of 40, and immunity or resistance to a variety of energies, often related to the color the dracolich possessed in life. If the phylactery is destroyed, the dracolich suffers no physical harm but it is unable to create a new phylactery. Thus, if it is slain, its death is permanent. (More on dracolich

phylacteries can be found on page 120 of the *Draconomicon*.)

EXAMPLE DRACOLICHES

No two dracoliches are alike, either physically or mentally, and each individual creature makes a special lair with unique followers, and shaped by its motives and desires. In creating lairs for dracoliches, bear in mind that such places are littered with so many potential escape routes that reaching their residents at all could be a task worthy of several adventures. Such lairs are guarded not only by the dracolich but by the surrounding terrain and devout followers both secret and overt.

THE BREATHER OF LOCUSTS

At the heart of the rainforest lies a steep hill strangled by twisting jungle boughs. This hill is alive: a brooding draconic terror that merely appears to be held amid the overgrowth. Yellow bones and decaying green flesh fester in the vines—a rotting olive spider in

the heart of its web, a living building of bone, decay, and hate. Vast canvases of skin flap from the frame, like sails on some huge vessel, and ribs like towers rise sharply upward to a gablelike back and a great green head. Two huge blackened sockets stand like caves at the top of this terrible form, and from within them burns a malicious green fire.

The Breather of Locusts is an evolved great wyrm green dracolich (see *Libris Mortis*) capable of vomiting from its rotting stomach huge plagues of bloodfiend locusts (10 swarms at a time). Of almost unfathomable age, it dwells in the legendary Twilight Mires, part of a great rainforest from where it plans, occasionally sending its children—swarms of bloodfiend locusts or hullathoin (both from the *Fiend Folio*)—into the world to do its bidding.

The Twilight Mires are a nightmare land of bottomless, sucking pools, of floating bogs where whole horizons seem to sway like bloated skins, of rivers that twist like mazes through deep canyons, and twisted rainforests filled

DRACOLICHES IN FAERÛN

In Faerûn, the first known dracoliches appeared nearly 500 years ago through the machinations of Sammaster First-Speaker—mad archmage, former Chosen of Mysteria, and founder of the Cult of the Dragon. While studying an ancient work of the seer Maglas, Sammaster mistranslated a key passage that led him to believe he alone had uncovered the destiny of Faerûn—to be ruled by undead dragons. As a result of this and the influence of one Algashon Nathaire, Sammaster devised the means to create dracoliches. Virtually every dracolich in Faerûn has some connection to the cult. All known dracoliches were originally “Sacred Ones” created by the cult and either serve a cult cell, lead a cult sect, or have rebelled and now plot their own schemes outside the scope of the cult’s activities (often involving the destruction of the cult that created and tried to dominate them).

A recent development in the continual plotting of the Cult of the Dragon involves the Grail of Shargrailar, a cup fashioned from one of the horns of the first dracolich created by Sammaster and the mightiest dracolich to ever walk the face of Faerûn. It is believed that somehow some part of that great night dragon lives on in the cup that bears his name, and the cult seeks to use the jeweled goblet as a phylactery for a new dracolich (preferably Nartheling, the ancient fang dragon that dwells atop Umbergoth in eastern Aglarond). It is believed that such a dracolich will possess the animating spirit of Shargrailar, restoring the most fearsome of all dracoliches to once again terrorize the lands. The leader in this scheme is the necromancer Winn Kardzen of Glarondar (CE male half-elf necromancer 7). Unfortunately, his plans have hit a snag, as the fabled grail has disappeared somewhere in the Yuirwood.

The 1998 release, *Cult of the Dragon*, details more of the cult’s history and activities, as well as the ongoing plots of numerous dracoliches currently active across the Realms.

with ancient trees that weep in the dark. In the deepest quicksand abyss of this place the Breather of Locusts hides his phylactery, a sphere of fused animal skulls. Nothing else lives in the forest, its floor of fallen leaves hiding uncountable numbers of bones.

SIN FEASTER

Sin Feaster—the LychSpider, Slayer of Harvests, the Nightmare that Watches and Waits—dwells in an abandoned cathedral on the edges of a cliff overlooking the ruins of a city the dracolich destroyed on a whim. The Feaster, a corrupted wyrm black dragon dracolich (see the *Book of Vile Darkness*), has made an alliance with the followers of Lolth and claims to be a consort of the Spider Queen herself. Its ruinous cathedral is choked with vast webs, with the dracolich lair in the spire itself, hundreds of feet up, where it watches and broods over its phylactery, an iron sphere that sits at the top of the spire. Driders and spiders live

in vast numbers in the dreadful city of webs, making it a nightmare of arachnid horrors. The spiders have spread their influence over the rocky hills and deep valleys, giving the region its name: the Ill-Woven Vales.

AURGLOROASA

Within the lost dwarven city of Thunderhome—a realm she personally destroyed—the shadow dragon dracolich Aurgloroasa scrys all those she calls foes. Vain and powerful, Aurgloroasa is an obsessive schemer and calculating adversary—traits exemplified by her

fixation with collecting every scale she has ever lost and fusing each brittle obsidian shard back onto her undead form, partially disguising her undead nature. Through her subtle manipulations from deep within the mountain, Aurgloroasa controls a vast network of worshipful agents, dictating events through them and from the shadows that cloak her every movement. The poisoned whispers she hisses from the darkness and her mastery of shadows have led her to be known as the Sibilant Shade.

DRACOLICHES IN EBERRON

Who knows what intrigues work within the mysterious land of Argonnessen? Some historians claim to have found evidence implying that some dragons allied themselves with the forces of Khyber during the Age of Demons, the cost of their allegiance being a dark gift of immortality—the secrets of creating dracoliches. Some wonder if the draconic stewards of this knowledge still secretly create undead dragons for their own unfathomable purposes. Perhaps they seek to retain the wisdom of their elders like the elves of Aerenal, or possibly an army of undead dragons now bides its immortal time deep within the draconic continent.

As an aside, the Keeper, one of the Dark Six, also takes the form of a skeletal dragon, and makes his lair in the Demon Wastes.

+39, Knowledge (dungeoneering) +34, Knowledge (history) +34, Knowledge (local) +24, Knowledge (nature) +24, Knowledge (religion) +43, Knowledge (the planes) +43, Listen +31, Move Silently +35, Sense Motive +39, Spellcraft +43, Spot +29

Possessions bracers of armor +8, crystal ball with true seeing, darkskull, gem of seeing, ring of wizardry III, wand of gentle repose (44 charges)

Breath Weapon (Su) Aurgloroasa's breath weapon is a 50-foot cone of billowing smoky shadows. Those affected by this breath attack gain 6 negative levels. Those who make a successful DC 37 Reflex save gain only 3 negative levels. Removing a negative level requires a DC 37 Fortitude save 24 hours later (see the rules for energy drain on page 308 of the *Monster Manual*).

Paralyzing Gaze (Su) Aurgloroasa's gaze can paralyze victims within 40 feet who fail a DC 35 Fortitude save. If the saving throw is successful, the victim is forever immune to her gaze. If it fails, the victim is paralyzed for 2d6 rounds. The save DC is Charisma-based.

Paralyzing Touch (Su) Any creature struck by one of Aurgloroasa's physical attacks must make a DC 35 Fortitude save or be paralyzed for 2d6 rounds. The save DC is Charisma-based.

Invulnerability If Aurgloroasa is slain, her spirit immediately returns to her phylactery, a single unremarkable onyx gem she hides in plain sight upon a towering obsidian pillar within her lair. If no dragon-type corpse lies within 90 feet for her spirit to possess, the dracolich is trapped within her phylactery

until such a time—if ever—that a corpse becomes available. If her phylactery is destroyed while it contains the dracolich's spirit and a suitable corpse is not within range, Aurgloroasa is permanently slain. Likewise, she is unable to possess the corpses of other dragons if her phylactery is destroyed.

Shadow Blend (Su) In any condition of illumination other than full daylight, Aurgloroasa can disappear into the shadows, giving her total concealment. Artificial illumination, even a *light* or *continual flame* spell, does not negate this ability. A *daylight* spell, however, does.

BECOMING A DRACOLICH

Although the *dracolich brew* and accompanying ritual is by far the most common method of becoming a dracolich (if such a thing can be considered common), there are other, even less-known, paths to this form of immortality.

The Well of Dragons: Hidden in an ancient caldera deep within a range of violently active volcanic spires, the Well of Dragons is difficult to reach even by draconic standards. This stagnant lake has been a dragon graveyard for untold centuries, its murky black waters riddled with ash and islands of dragon bones. Unlike other dragon graveyards, though, this place has been forsaken by all goodly dragons, and thus only chromatic dragons come here to die.

A cursed place said to have once been a brooding pit of the great dragon Tiamat, the dragon mother beckons her most powerful children back to the Well of Dragons as they near the times

of their deaths. The Chromatic Dragon is not a nurturing mother, though, and seeks the service of her spawn even in death. Most dragons who drink directly from the Well of Dragons are stricken down and die immediately, animating as mindless zombie dragons (see the *Draconomicon*, page 198) in 1d4 days. Those with exceptionally powerful personalities (Charisma of 25 or greater) sometimes manage to retain their minds, awaking in 1d4 days as dracoliches, the skulls of nearby lesser dragons spontaneously becoming their phylacteries. The waters of the Well of Dragons have no effect if removed from their tainted caldera.

Through the centuries the Well of Dragons has become a legend among dragonkind, leading countless wyrms on fruitless and often fatal searches for its location. Those who find the caldera must still contend with the dead wyrms that have come before them, now total slaves to Tiamat's will and protectors of the foul well.

Spiritgorgers: After uncounted eons of undeath some liches'—and even some dracoliches'—physical forms decay to dust, leaving only their phylacteries behind. In most cases such undead reform in some hateful new body, refreshed and more powerful

ALTERNATE DRACOLICHES

Not all dracoliches are true dragons. In fact, any creature with the dragon type can become one of these undead horrors, opening the door for dracolich wyverns, dragon turtles, and all manner of half-dragons. Surviving the process of becoming a dracolich is an incredibly painful and trying experience for a mortal spirit, and one that not even all dragons survive. Thus, while non-true dragon dracoliches do exist, they are incredibly rare. For an example, find Sakatha the Deathless, a half-black-dragon twelve-headed hydra dracolich in this issue's web enhancement available at paizo.com/dragon.

than ever—but occasionally they return to their phylacteries as trapped souls. Such phylacteries, known as spiritgorgers, are dangerous to deal with. The hateful unlife within the phylacteries whisper and make promises to anyone who has the misfortune to find them. If the owner makes a willing pact with the phylactery he curses himself with lichdom—his physical form is instantly destroyed and he rises as a lich with two minds in one corrupt body. Such schizophrenic abhorrences are usually driven mad by their impossible double mind or are wholly overwhelmed by the lich's ancient sentence.

Rare cases exist of demented dracoliches being created in such a way. The mad dracolich of the Corusk Mountains calling himself the Infernal Skald is one such example of this sort, combining the essence of the ancient dragon Prystis—these the White with the frost giant sorcerer/bard Beostagg. Able to assume either form, the Skald

alternates between visiting the giant holds of the mountains as a lorekeeper and entertainer or razing them as a draconic attacker—often both on the same lodge within a week.

Soul Substitution: On very rare occasions, when the circumstances are just right, a dragon skeleton that has been necromantically charged and kept in long proximity with a receptacle holding the essence of some powerful evil being—such as an entrapped fiend or bound soul—can spontaneously arise as a dracolich. One occurrence of this phenomenon bides its time at the Silphar Royal Museum in the Kingdom of Raoke. For long years this museum has displayed the treasures of the ancient priest-king Ramaket, looted from his hidden burial site by graverobbers. Among these treasures is a jeweled urn said to hold Ramaket's ashes. Yet also within the urn resides Ramaket's soul, which has been helplessly imprisoned in the vessel for millennia. In an adjacent gallery hangs a display featuring the mounted skeleton of an old blue dragon. The curator of the museum, a sorcerer, secretly cast *animate dead* on the skeleton to guard the treasures of the museum against thieves. Unbeknownst to the curator, the powerful will of Ramaket's entrapped soul has slowly begun influencing the necromantic magic animating his mindless guardian, gradually transforming the undead thing into a dracolich with the mind of the evil priest-king—the ancient urn serving as its phylactery. It is only a matter of time before the soul will have attained sufficient control of its new body to launch a second reign of Ramaket. ■

Phylactery

The CULT OF THE DRAGON

by Ed Greenwood

Describing the dreaded dracolich
and the sorcerers who create them

The series of DRAGONLANCE™ modules and novels from TSR, Inc., have given us a detailed campaign setting dominated by warring dragons: the world of Krynn. This world is an admirable setting in which to begin an AD&D® game campaign, or “a nice place to visit” (via interplanar spells) for player characters in an established campaign.

Krynn is otherwise rather difficult to integrate into an ongoing AD&D campaign. It is too polarized a world for casual adventuring, and comes complete with its own gods, powerful magic, and large-scale strife-in-progress. For those DMs who like their dragons less dominant, but still fancy some sort of dragonkind organization or power group (rather than using dragons as a succession of isolated, unsuspecting targets), I present some details of the mysterious Cult of the Dragon, from my *Forgotten Realms* campaign.

Less powerful — thus, necessarily more secretive — than the forces at work in Krynn, this group of human dragon-worshippers (and a splinter group or independent sect, the devil-worshipping Dragon Lords who serve Tiamat directly) has been one of the behind-the-scenes continual adversaries for a group of quite energetic players over the last five years or so. There is no reason its activities could not serve as a similar incentive to challenging adventures in other campaigns.

Respectful non-believers refer to the Cult as “The Followers of the Scaly Way.” “Dragon-lovers” is a less complimentary term. The Cult serves as a communications network between members of evil dragonkind throughout the Realms, as well as directly aiding (by physical defense and healing magics) and monetarily enriching (by means of offerings of precious objects of all kinds) the creatures of their veneration. The sign of the Cult, used as a way-marker or recognition signal among members, is a claw grasping a crown — the crown representing rulership of the Realms, the claw representing the dragons revered by the Cult. There is also a gesture used by Cult members to identify themselves to colleagues and allies — extending a hand, palm down, from one’s chin directly outward and forward, fingers held straight out and together, and blowing along these extended fingers from one’s lips. Cult members include many powerful evil mages, fighting-men of all levels of skill, and a few evil clerics. Most of the more powerful Cult members can converse in one or more evil dragon tongues (most commonly red or blue).

The origins of this cult can be traced precisely to the writings of the long-ago mage Sammaster (the same who, much later, was destroyed as a lich by “The Company of Twelve” paladins in the ruined city known as “The Gates of Hell”). Sammaster translated a particular passage of *The Chronicle Of Years To Come*, written by the legendary oracle Maglas, and took from it a meaning different from most. Here is the

passage as rendered by Elminster and most other sages:

“And naught will be left save shattered thrones, with no rulers but the dead. Dragons shall rule the world entire, and . . .”

Sammaster, however, interpreted the passage thus:

“And naught will be left save shattered thrones, with no rulers. But the Dead Dragons shall rule the world entire, and . . .”

Followers of Sammaster (who himself achieved lichdom) interpreted this to mean that the ultimate rulers of the world would be “dead dragons” — and, as Sammaster’s own researches had just resulted in the rediscovery of the process of creating a lich, someone (thought to be the renegade cleric Algashon) seized upon the idea of creating undead dragons by a similar process. The Cult was founded with the aim of creating and serving these “dead dragons,” elevating them to dominance over all dragonkind, by dint of their lich-powers and the allied strength of the Cult organization, and ultimately ruling over the world itself. The Cult — or, rather, the dracoliches of its creation — can claim to have conquered the kingdom of Peleveran in the far southeastern Realms, but only by means of laying waste to the kingdom. What was once a tree-cloaked, fertile land is now barren, stony, open country.

The goal of mastering the means to create dracoliches (or, as non-believers who knew nothing of their origins first dubbed them, “Night Dragons”) was achieved with surprising rapidity, considering that until the process was proven to work, there were certainly no willing, cooperative subject dragons to be found. The earliest dracoliches created by the Cult have now existed in their undead status for some four hundred and sixty winters — and all of these dragons were of ancient age when the process began. Most sages believe that, like the once-human monsters known as demi-liches (see *Monster Manual II*), the body of a dracolich will decay with time, becoming skeletal and later collapsing entirely into dust. The magic then preserves the dragon’s spirit more or less as a disembodied entity.

What will then occur is not known. Will these demi-dracoliches have even more fearsome powers? Or, will they pass away into nothingness? Some sages, notably Raglar “the Worldwatcher,” hold that any dragon unable to **physically** hoard, handle, defend, and acquire more treasure will ultimately go insane — as continual, sensual contact with the hoard is so great a part of a dragon’s nature. Others, notably Askarran of Selgaunt, say that it is unwise to speculate in so murky a field — **nothing** is yet known, so nothing can be intelligently hazarded. Some sages, such as Ahlimon of Iriaebor, assert that ultimately all “disembodied” dracolich spirits are drawn to the Lower Planes, as are all evil spirits upon death, and there become larvae.

The process of creating a dracolich is now

well known among sages, however, for the cultists have implemented it vigorously — particularly upon huge, very old or ancient evil dragons with spell-casting powers. The difficulty, for the cultists, has traditionally been in getting dragons to agree to undertake the process. In the early days of the cult, this was usually solved by forcing a dragon into it, an activity that took its toll in both warriors and mages. This tactic is now frowned upon.

The traditional initial step in preparation for lichdom is the imbibing of a potion. The potion for dragons differs from that used by humans in both ingredients and effects — but, as with the latter, it must all be imbibed in one dose for it to work at all, and it does not always cause the desired effect. The ingredients are as follows:

Two pinches of pure arsenic

One pinch of belladonna

One measure of fresh (less than 30 nights old) phase-spider venom (at least one pint)

The blood (at least one quart) of a virgin of a demi-human individual, of a long-lived race (or, alternatively, a gallon of treant sap; this ingredient must have been drawn seven or less nights previously)

The blood (at least one quart) of a vampire or a person infected with vampirism (this ingredient must have been drawn seven or less nights previously)

One complete **potion of evil dragon control**

One complete **potion of invulnerability**

The seven ingredients must be mixed together in an inert vessel (such as one of stone) by the light of a full moon, adding the ingredients to the vessel in the order listed, stirring all the while with the blade of an undamaged, magically whole *sword +2, dragon slayer* (which may be of any alignment, and strikes for triple damage against any sort of dragon). It may be imbibed at any time thereafter; the mixture will only lose its efficacy if it is touched by direct sunlight while uncovered, or if it is mixed with other liquids.

When such a potion is drunk by any sort of true dragon, it will have the following effects:

Dice Result

- | | |
|-------|--|
| 01-46 | Potion does not work. The dragon suffers 2-24 hp damage, is helpless with convulsions for 1-2 rounds, and loses any spells memorized. |
| 47-66 | Potion works. The dragon lapses into a coma for 1-4 rounds, and when it rouses knows that the potion has worked. |
| 67-96 | Dragon slain instantly, but potion works. If the “host” has been prepared, the dragon’s spirit will go there and continue the process of becoming a dracolich. |
| 97-00 | Dragon slain instantly; potion |

does not work. A full *wish* is needed to restore dragon to life. (A wish to transform it to undead, dracolich status will cause another roll on this table, instantly.)

If any creature other than a true dragon imbibes any portion of a dracolich potion, use the following table to determine the potion's effects:

Dice Result

- | | |
|-------|--|
| 01-44 | Painful death in 1-2 rounds. The victim shrieks and has convulsions. |
| 45-67 | The imbiber is dealt 3-36 hp damage, as the potion corrodes his internal tissues. |
| 68-72 | The imbiber is <i>feble-minded</i> and affected by a withering disease (treat as the "rotting disease" inflicted by a mummy). |
| 73-80 | The imbiber goes into a coma for 1-6 turns, and is driven <i>insane</i> (as per the DMG). |
| 81-84 | The imbiber goes into a coma for 1-6 turns, and upon awakening can speak all evil dragon tongues. |
| 85-90 | The imbiber goes into a coma for 1-6 turns, and thereafter nothing appears to occur. (DM's note: The imbiber has been rendered forever immune to vampirism, the disease — but can still be life-drained and physically damaged by any vampire(s) encountered.) |
| 91-00 | The imbiber goes into a coma for 1-6 turns, and nothing more occurs. |

No *charm*, aura reading, or similar spell or mental test will reveal that a dragon has successfully drunk such a potion.

The Cult of the Dragon always prepares the dragon's "spirit-host" before administering the potion, in case the potion slays the dragon instantly. This host must be a solid item of not less than 2000 gp value that will resist decay (wood, for instance, is unsuitable) and was magically prepared. Gems are commonly used, particularly specimens of carbuncle and jet — although peridot, sard, ruby, and sometimes even fragile black pearls or obsidian have been employed. It is desirable that the host item be often close to corpses (as explained below); for this reason, such a gem is often set in a sword-hilt.

The host first has *enchant an item* cast upon it (and must save vs. spell as though of the caster's level for this to be successful). If desired, *glassteel* can then be cast upon it, to protect the host, and then *trap the soul* must be cast upon it. Upon the speaking of the dragon's *truename* during the casting, the dragon will instantly lose 1 hp per hit die it currently possesses; these pass forever into the host. (The host should not have a *maze* spell cast on it; it is not a "soul-prison.") The dragon will fall instantly into a coma for 1-4 days, and during this time its mind cannot be contacted or attacked by

magic or psionics. Its mind is unreachable, as it's spirit flits back and forth constantly between the host and its dragon body. (Any spells memorized by the dragon at the time *trap the soul* was cast are lost.)

If the dragon dies or is slain at any time after this, and it has before death imbibed the aforementioned potion, its spirit will go into the host, regardless of the distance between dragon body and host (which can even be on different planes of existence) or the presence of *prismatic spheres*, lead boxes, *cubes of force*, or similar obstacles. At this time, the host will *levitate* for 1-6 rounds, rising two or three inches upward.

Cult mages (or any other mage wishing to aid a dragon in attaining lichdom) must then provide a reptilian corpse, ideally that of a dragon or related creature. The body of an ice lizard, fire drake, wyvern, or fire lizard is ideal; that of a dragonne, dragon turtle, or dracolich has only a small chance of successful use by the dragon's spirit. The corpse of a pseudo-dragon, pterandon, or other non-draconian creature is extremely unlikely to work. The body must be freshly killed (or, at least, dead within the period of the current moon, or 30 days), and within 90' of the host. The mage must then touch the host, cast a *magic jar* spell that includes the *true name* of the dragon, and then touch the corpse. In effect, the mage carries the dragon's spirit from host to corpse within his or her own body.

The corpse must *fail* a save vs. spell for the dragon's spirit to successfully possess it; if it saves, it will *never* accept the spirit. For this saving throw, the corpse is treated as a fighter of the same level as the dragon had hit dice when alive, with the following modifiers (any that apply) to the roll:

- 4 if the corpse is of the same alignment as the dragon
- 4 if the corpse is that of a true dragon (any type)
- 3 if the corpse is that of a fire-drake, ice lizard, wyvern, or fire lizard
- 1 if the corpse is that of a dracolich, dragonne, pterandon, or dragon turtle
- +3 if the corpse is that of a non-reptile (i.e., not a lizard man, snake, ophidian, or the like)
- 10 if the corpse is the dragon's own former body (which can be dead *any* length of time)

If the dragon's spirit cannot enter the body, it will take over the magic-user's own body, unless the magic-user returns it to the host by touching the host again within 2-12 rounds. It can remain in the host for any length of time without harm — unless the host is itself destroyed.

If the corpse accepts the dragon's spirit, it becomes animated by the spirit, and has the dragon's own mind and its dracolich immunities (see below). It will be telepathic if the dragon could speak in life, but unless it is

the dragon's own former body, cannot speak — and therefore cannot cast spells with verbal components. (If your campaign rules dictate that dragons must use their forepaws to manipulate material and somatic components, then the dracolich may meet further difficulties if the corpse has no usable forepaws.) It can learn spells if they are available to be memorized, until its roster is full, whereupon it can never learn spells again. If the Cult of the Dragon is involved, the Cult will see that powerful and useful magics are learned.

The "proto-dracolich" has but one goal: If it is not itself the body of the dragon, it hungers for the original body, and will seek out and devour that corpse. (For this reason, Cult members favor using the dragon's own body — i.e., keeping the host near it — or else providing corpses with wings, to make any journey to the original body as rapid and easy as possible.) The dragon's spirit can sense the direction and distance of its own former body, regardless of distance (although it cannot pass without aid to another plane of existence to reach it), and will tirelessly seek it out, not needing other meals for sustenance, nor rest.

If the dragon's own body has been burned or dismembered, the proto-dracolich need only devour the ashes or pieces. Total destruction of the dragon's body is possible only through use of a *disintegrate* spell (the body gets a normal save vs. the spell). If a Cult mage or other magic-user casts a *limited* (or full) *wish*, the body can be reincorporated if it was disintegrated on the Positive, Negative, or Prime Material Plane, as long as the *wish* is cast in the same plane as that *disintegration* occurred. Typically, various teeth and organs of a dragon are carried off by magic-users, alchemists, or adventurers wishing to sell such remains to mages or alchemists, and the proto-dracolich need only wait until such individuals are asleep or engaged in other activity (such as combat or spell-casting) to seize and devour the parts.

Only 10% or so of the body must be so devoured for the proto-dracolich to achieve its aim (it will know when this has occurred). Thereafter, within seven days, the proto-dracolich will metamorphose into a body resembling the dragon's original body in life — able to speak, cast spells, and employ the breath weapon just as the dragon could when it was alive. (If the dracolich possesses its own former body, it regains speech and the use of its breath weapon within seven days of possession.) It is then a dracolich, with the powers and properties described below, and becomes an object of worship, aid, and protection for all members of the Cult of the Dragon throughout the Realms.

The dracolich will immediately be gifted with gold and gems by the most senior members of the Cult, "The Keepers of the Secret Hoard," and these mages will provide it with spells if it so desires. The Keepers have carefully gathered, recorded, and improved a selection of powerful spells for

the use of its winged leaders. The Cult is known to have and provide the following magics:

1st Level	2nd Level
<i>Affect normal fires</i>	<i>Audible glamor</i>
<i>Dancing lights</i>	<i>Continual light</i>
<i>Identify</i>	<i>Darkness 15' r.</i>
<i>Light</i>	<i>ESP</i>
<i>Magic missile</i>	<i>Flaming sphere</i>
<i>Mending</i>	<i>In visibility</i>
<i>Message</i>	<i>Knock</i>
<i>Push</i>	<i>Levitate</i>
<i>Shield</i>	<i>Locate object</i>
<i>Sleep</i>	<i>Magic mouth</i>
<i>Unseen servant</i>	<i>Pyrotechnics</i>
<i>Ventriloquism</i>	<i>Ray of enfeeblement</i>
<i>Write</i>	<i>Stinking cloud</i>
	<i>Web</i>
	<i>Wizard Lock</i>
3rd Level	4th Level
<i>Blink</i>	<i>Charm monster</i>
<i>Clairaudience</i>	<i>Confusion</i>
<i>Clairvoyance</i>	<i>Dig</i>
<i>Dispel magic</i>	<i>Dimension door</i>
<i>Fireball</i>	<i>Fire trap</i>
<i>Gust of wind</i>	<i>Ice storm</i>
<i>Hold person</i>	<i>Minor globe of inv.</i>
<i>Lightning bolt</i>	<i>Polymorph other</i>
<i>Slow</i>	<i>Polymorph self</i>
<i>Suggestion</i>	<i>Remove curse</i>
<i>Tongues</i>	<i>Wall of fire</i>
<i>Water breathing</i>	<i>Wall of ice</i>
<i>Wind wall</i>	<i>Wizard eye</i>

The report of one adventurer, thus far unverified, suggests that *Nystul's magic aura* (or an equivalent spell that places false magical auras upon items in a dragon's hoard) is also in the Cult's list of dragon spells, and perhaps also *Melf's minute meteors*, or a similar "multiple balls of fire" spell which is within the reach of dragons and dracoliches aided by the Cult.

Dracoliches employ their spells as though they were magic-users of the same level as their number of hit dice (at the time of the original full-roster memorization, "host" hit points included).

The Cult cannot directly control any dracolich. Members of the Cult revere dragons, and work instead by trying to build friendship, trust, and mutual respect. Dragons and dracoliches are loners, but they *do* enjoy the knowledge that they have allies, and place value in such relationships. The Cult can, however, request (by messenger or signal) the aid of any and all dracoliches. It does so only when necessary, and is careful to reward with treasure any dragons or dracoliches giving such aid. The signal mentioned here is given by means of a magic item developed by the Cult: the ring of dragons. Worn only by powerful Cult members (there are perhaps seventy such rings in existence), these rings are activated only by the will of the wearer, who can cause such a ring to become a beacon for all dragonkind.

The ring of dragons (which appears as a

normal brass ring) causes a twinkling radiance and a mental calling, confined to the plane of the wearer, but of unlimited range on that plane, audible and visible only to dragonkind. Only evil dragons will feel the calling; any interested dragon may respond. The signal has a pinpoint location (*i.e.*, an observable, precise direction and distance from any dragon becoming aware of it), and will continue until the wearer wills it to end, moving with the ring, but ceasing if the ring is removed from the wearer who activated it. No control or influence over any dragon is conferred by the ring.

The ring also empowers any wearer to communicate verbally in any dragon tongue, and telepathically with any true dragon, and the wearer can also cast (once per day) the *illusion* of a dragon, within 6" of the wearer, such an illusion having any appearance and sounds that the ring-wearer can recall, but having no physical existence, no ability to cast spells, and no ability to do any form of damage, even if believed. No true dragon will be fooled by such an illusion. The illusion serves as a recognition symbol or, in a pinch, as a diversion. A ring of dragons is usable by any intelligent creature, regardless of race, alignment, or class, who can physically place it upon a manipulative digit. Most sages value such rings at about 15,000 gp. The method of their making is presently unknown outside the Cult, and they are not offered for sale.

Each time a dracolich is slain, its spirit

can return to the host; if it possibly can, the dracolich will try to bring its body with it (i.e., escaping before being brought to zero hit points) by spell or magical aid. Each time a dracolich returns to its host, it loses permanently one hit die (1d8) of hit points; if by such means a dracolich is ever brought to zero hit points, it passes away (presumably to the Lower Planes) as a helpless, disembodied spirit. If it ever returns to the host and there is no corpse within range for it to possess, or if it fails to possess all corpses within range, it is trapped in the host until such later time (if ever) that there is a corpse within range that it successfully possesses. (After the initial *magic jar* described above, the later assistance of a magic-user is not necessary.) The dracolich must devour its former body each time it possesses a new one, if it is to regain its dracolich powers.

If a proto-dracolich cannot devour its original body, due to barriers or the destruction of its original body, it is trapped in that form until again slain; it cannot leave its proto-form at will to return to the host and await a "better" form to possess. Proto-dracoliches can never cast spells, nor do they possess the chilling damage, breath weapon, or fear-causing powers of the dracolich — but they do have the hit points of the dracolich, its immunities to spells and to clerical turning, and the wisdom and intelligence of the dragon or dracolich. Strength and armor class are those of the possessed

body — and the dracolich can use any special magical or physical powers of the possessed body not destroyed by its own original death, including (recall its intelligence) status, possessions, and the like if the possessed body is of an intelligent, social race. A dracolich can *never* forcibly possess a living body. Details of the dracolich form follow:

DRACOLICH (Night Dragon)

FREQUENCY *Very rare*

NO. APPEARING: 1 (*unless called by a ring of dragons*)

ARMOR CLASS: -2

MOVE: *As per former dragon type*

HIT DICE: *As per former dragon type*

% IN LAIR: 20%

TREASURE TYPE: B, H, S, T

NO. OF ATTACKS: *As per former dragon type*

ALIGNMENT *Evil (any sort)*

SIZE: *L (dimensions vary)*

PSIONIC ABILITY: *Nil*

Attack/Defense Modes: *Nil/nil*

CHANCE OF:

Speaking: 100%

Magic Use: 96%

Sleeping: 0%

LEVEL/X.P. VALUE: *Varies/As per former dragon type, plus 1000 + 10/hp (if destroyed, along with host)*

A dracolich is an undead creature, an unnatural transformation of evil dragonkind by powerful magic known to be practiced only by the mysterious Cult of the Dragon. Like human liches, dracoliches are immune to *charm*, *sleep*, *enfeeblement*, *polymorph*, *cold* (magical or natural), *electricity*, *insanity*, and *death spells* or *symbols*. By the nature of its making, a dracolich is also immune to potions or items of *dragon control*. Dracoliches can be affected only by magical attack forms (against which they have standard magic resistance, except for the immunities listed), or by monsters with magical properties of six or more hit dice. They cannot be poisoned, paralyzed, or held. They cannot be turned by clerics, and the knowledge of their ability to escape destruction works in dracoliches a transformation from cowardice to confidence; if a dracolich ever triumphs in any battle, from that point on, it is fearless (including immunity to magical *fear* or psionic attacks causing fear) and cannot be subdued.

A dracolich retains the keen senses (60' infravision, ability to detect hidden or invisible creatures within 1" per age level) it enjoyed in life, but its bodily processes are maintained magically; it need never eat again for sustenance. Most dragons enjoy

eating — and a dracolich must eat if it wishes to refuel its breath weapon — but a dracolich never feels weakness, fatigue, or hunger. Attacks upon a dracolich, due to its magical nature, do *not* gain "to hit" or damage modifiers by type and breath weapon of dragon attacked.

All physical attacks by a dracolich (jaws, claws, and wing or tail buffets, where applicable) do the damage dealt by the dragon in life, plus 2-16 hp chilling damage. Opponents struck who fail to save vs. paralyzation will also be paralyzed for 2-12 rounds by the touch of a dracolich. (The victim's immunity to cold damage, temporary or permanent, negates the chilling damage but not the chance of paralyzation.) Dracoliches cannot drain life energy levels. They retain the ability to cause *fear* in opponents (as per the *Monster Manual*) that they had in life; as a lich, the fear they cause is slightly stronger — opponents must save vs. spell against the *fear* aura at -1 (after all other modifiers are taken into account). The gaze of their glowing eyes can also *paralyze* creatures within 4"; creatures of 6th level or above, or 6 hit dice or greater, save at +3. If a creature ever saves against the gaze of a particular dracolich, it is immune to the gaze of that dracolich from then on.

Dracoliches can use any magic available to them in life; once they have acquired a full roster of spells (most are aided in this by the Cult), they can never gain new spells, but never need to study or concentrate to replenish their arsenal. Their magical natures revitalize their spell ability, each spell being replaced 1 day after it is cast. Instead of casting a spell, a dracolich may attempt *undead control* (as per a *potion of undead control*) once every three days. Such control, if successful, lasts for one turn only, upon any sort(s) of undead present, and such undead save at -3 vs. the control. Control can be exercised up to 6" distant; undead cannot be *summoned* by means of this power. While *undead control* is being exercised, spells cannot be cast. A dracolich cannot drop *control* of undead, and regain it immediately after casting a spell — it must wait three days before any attempt at *control* will again be successful. Dracoliches without spell-casting ability can use *undead control*.

Dracoliches can employ their breath weapons only three times a day, as in life. Note that they will *teleport* (if provided with a means, such as a magical ring, by the Cult or through their own acquisition of treasure), or merely leave their bodies behind and flee in spirit-form, to return to the vicinity of the host (often a sword in their own hoard) that contains the essence of their spirit before being reduced to zero hit points; few opponents can destroy a dracolich outright. A dracolich can be destroyed by a *power word, kill*, or by the destruction of its host at a time when a suitable corpse is not within range for the dragon's spirit to possess.

Dracoliches usually appear as they did in life, except save that their eyes are glowing

points of light floating in dark eyesockets. Some few are reported to appear skeletal or semi-skeletal.

From all of this, it can be seen that members of the Cult of the Dragon are busy folk. Like independent adventurers, they are always seeking treasure — particularly “old” treasure found in ruined cities, tombs, or dungeons. If a party should encounter Cult members, it is likely that the Cultists will strike to slay, unless they already have treasure in their possession and believe they can escape or avoid those they have encountered. In any fight, members of the Cult of the Dragon are to be feared; they are almost all powerful fighters and magic-users, and will always be led by a mage or mages of 12th or greater level (usually 16th or so). Such leaders always wear a *ring of dragons*. As previously mentioned, this ring may serve to bring dracoliches to the aid of the Cultists, if they are sorely pressed.

Cult members also undertake regular visitations to all evil dragons and dracoliches they know of, offering riches for the hoards of each, proffering healing potions or physical aid in enlarging a dragon's treasure chamber or access tunnel, or arranging mechanical traps to slay adventurers who would plunder dragon-hoards. Any evil dragons they hear of or see evidence of are tracked down tirelessly, and attempts to persuade them into alliance with the Cult

are made — an arrangement that leaves their hoards and solitude largely intact, broken only by the occasional messenger from the Cult, who always carries news (news is something dragons of any sort are always eager for) of events in the Realms, the doings of the Cult, and the affairs of all dragons. Such messengers always ask if there is any service that they or their companions can render to the dragon or dracolich (and will undertake such tasks instantly if the nature of the task allows), always flatter the dragon respectfully in speech, and always bring large amounts of treasure as an offering. In return, the Cult asks that its members can seek sanctuary in the dragon's lair if *in extremis*, and that the dragon respond to any call for aid by a messenger or by means of a *ring of dragons*, by flying to the source ready for combat. Such messengers always announce their coming by utterance of a password chosen by the dragon, and always remind the dragon of the Cult's aim of raising dragonkind to rulership over all the world — a rule in which, of course, the particular dragon addressed will be of great rank and importance. The powers and apparent immortality of the dracoliches is mentioned, offhandedly, every so often, too

After some years (at least ten winters, if the Cult is allowed to operate without hindrance) of visiting a particular dragon, the Cult messengers will begin to delicately broach the subject of lichdom, and finally

put it as a proposal to the dragon, promising immortality, and (if the dragon can cast spells) the Cult's provision of the most powerful possible spells. It is known that few dragons have refused, in the end, although some have taken a score of years or more to “think it over.” Most sages do not believe that the Cult forces dragons into imbibing the potion that begins the process any longer, fearing that this might affect their ultimate loyalty to the Cult. The Cult will, as part of the process of achieving lichdom, ritually put to death a prepared dragon, if the latter so wishes. The Cult prefers (and urges instead) that dragons prepared for lichdom instead go forth and engage in combat too dangerous for them to contemplate in life — attacking a city, or the tower of a powerful wizard, perhaps, or a rival (non-Cult, and probably of good alignment) dragon — and die gloriously. This has the threefold advantage of damaging opponents or potential adversaries of the Cult, of increasing the Cult's reputation throughout the Realms (Cult members make sure word of such events gets around, and that the Cult is mentioned as a reason), and of urging the particular dragon to rise above its own innate cowardice, perhaps for the first time ever — a psychological feat that will serve it well when it becomes a dracolich.

Cult members are also kept busy finding, capturing, and tending (or training) dragon eggs, hatchlings, and creatures related to dragons, such as the wyvern, fire Drake, ice lizard, fire lizard, airdragon (pterandron), pseudo-dragon, dracolisk, and dragonne — if these are not used for host bodies in attaining lichdom, they serve as work-beasts or mounts for the Cult, or in the continuing experiments to speed (and increase the power of the end product of) the process of dracolichdom. Cult members also gather at every opportunity any substances required as ingredients in the dracolich potion.

DMs should view the Cult as a vast network of evil (largely neutral evil) images and fighters, all dedicated to a cause and finding their lives' work and fulfillment in furthering that cause — a Cult which works tirelessly in loose teams of adventurers, working as described above (which activities could well bring Cult members into repeated encounters with player character adventurers), and communicating amongst themselves by means of magic, messengers on airdragons, innkeepers in certain Cult-run or Cult-sympathetic inns, and by means of message caches (often magically concealed writings on rock in prearranged locations). Cult fighters who attain the necessary levels often found a stronghold in some locale they favor, and it becomes a safe haven for the Cult. The owner of the stronghold continues to adventure for the Cult, and Cult members aid in the defense of the area (if necessary) and assist in the running of the stronghold owner's business while he or she is adventuring “And the day will come,” as Cult members say, “when the dead dragons rule over all”

SHADOW GRAPHICS presents "VALSHEA" by PARKINSON

This 18"x24" art print (suitable for framing) is available for only \$10. For the more serious collector, a signed & numbered limited edition print is also available. Printed on high quality paper, only 500 of these fine prints were produced. Each one personally signed & numbered by the artist. Sure to be a prized addition to your collection, order your copy for just \$20. Send check or money order (WI residents add 5% sales tax), plus \$2 for shipping & handling to: Shadow Graphics, V-1, P.O. Box 101, Lake Geneva, WI 53147. Allow 3-4 weeks for delivery.

The elven fighter/magic-user, Lady Valshea and her familiar take a break during their passage through Blue Rock Vale.

*"...when three moons rose from the lap of the forest, dragons, terrible and great, made war on this world of Krynn."
—The Canticle of the Dragon*

THE ECOLOGY OF THE

DRACONIAN

Charging through the acrid smoke of the battlefield, wings flapping, swords drawn, a company of draconian shock troopers terrifies even the most hardened knight. Nobody could have imagined such creatures before the War of the Lance. Since then, draconians have left an indelible impression, one colored by rumor, supposition, and fear.

HISTORY OF THE DRACONIAN

Legends say that in the ancient days of Krynn, Paladine, the noble ruler of the gods, and Takhisis, the Queen of Darkness, bent their divine wills upon the elements and created the first dragons from base metals. Dragons of tin, lead, nickel, zinc, and iron, these creatures were the blessed of the gods. Covetous Takhisis, however, wanted the dragons as her own and, whispering corruption into their ears, they became tarnished and wicked. Sorrowful, Paladine sought to create five more dragons, this time from precious metals, and set them in opposition to their now chromatic cousins. Thus the gods set the stage for the

world of Krynn, home of the DRAGONLANCE campaign setting, and the many wars that would play out upon it.

Takhisis repeatedly attempted to conquer Krynn, her cause championed by ogres, lizardfolk, evil humans, and goblins. Each time, knights, elves, and Paladine's dragons defeated her. Bitter at the failure of her armies, Takhisis plotted revenge after revenge, finally striking upon an answer. She needed a new race of warriors and servants, loyal to her alone, a living symbol of her hatred for the dragons of light.

She gave Harkiel, a sly and crafty female red dragon, the task of secretly flying to the Dragon Isles. There the good dragons had spent the last thousand years apart from the mortals of Krynn. From them Harkiel stole their precious eggs, leaving behind her Dark Queen's threat: stay out of the coming conflict or the eggs would be destroyed. Thus, the good dragons remained in exile, watching helplessly as the powers of evil began to work in secret, readying their armies for war.

Takhisis had no intention of keeping the eggs safe. Indeed, they offered the key to her revenge. She imparted upon Dracart, a wizard of the infamous black robes, and Wyrllish, one of her dark clerics, the instructions for a vile ritual. Together with Harkiel, these depraved individuals corrupted the good dragons' eggs with dark magic, blasphemous invocations, and dragon ichor, deep within the dungeons beneath the city of Sanction. When these eggs hatched, an entirely new race spilled forth from the defiled shells—draconians.

The forces of the Queen of Darkness made quick use of this new secret weapon. Growing rapidly, the draconians matured, trained, and formed a powerful appendage of the rising dragonarmies, swiftly convincing Ariakas, Takhisis's chief Highlord, of their effectiveness. As the War of the Lance unfolded, refugees spread word of monstrous dragon-men, but the world had not seen dragons in more than a thousand years and the general populace largely considered these reports the ravings of madmen—at least, until the abominations took to the fields of war en masse.

After months of battle, the beleaguered forces of good discovered the secret behind draconian creation,

KNOWLEDGE OF THE DRACONIAN

The following table shows the results of a bardic knowledge or Knowledge (arcana) check related to draconians. This table assumes that a game takes place after the defeat of Dracart, Wyrllish, and Harkiel. Prior to this event most of the information about draconian creation remains unknown.

Knowledge (arcana)

DC Result

10	Draconians are brutal dragon-men. They have wings and scales and walk on two legs. Less savage than orcs or goblins, they wear armor and use weapons like trained warriors.
15	There are different breeds of draconian, and they all die in different, dangerous fashions. Some turn to stone, some to acid, and some explode.
20	The five types of draconian are aurak, baaz, bozak, kapak, and sivak. Bozaks and auraks cast spells, while sivaks can change shape and take the form of people they kill. The presence of evil dragons boosts the confidence of draconians.
25	Each of the five breeds of draconian is linked to one of the five good dragons. Despite being creations of dark magic, not all draconians are unable to overcome their evil tendencies.
30	A vile corruption ritual creates the draconians and involves the eggs of good dragons. An evil wizard, a dark cleric, and an evil dragon are required to perform this ritual.

a revelation that proved a turning point in the war. Gilthanas, an elven prince of the Qualinesti, and D'Argent, a silver dragon who had defied her oath of non-intervention, infiltrated the tunnels underneath Sanction and learned the truth. The heroes defeated Dracart, Wyrllish, and Harkiel, and brought draconian

creation to a standstill. D'Argent and Gilthanas returned the uncorrupted dragon eggs to the Dragon Isles, freeing the dragons of light from their oath. The good dragons released their fury by striking back at evil dragons, avenging their murdered young and allowing the allied goodly races to resist the dragonarmies.

Defeated, scattered to the four corners of Ansalon, and deprived of many of their highest-ranking leaders, the dragonarmies continued to lash out for years after the War. The draconians, trained for nothing but battle and terror, remained a dangerous and capable enemy even in a time of peace. Eventually, though, factionalism and rivalry erupted among draconian units and breeds. Lacking the cohesion of the dragonarmies, the draconian race split apart into like-minded groups, each seeking its own fate.

Yet the real question arose: could a race of warlike, unstable, and cruel creatures ever hope to regain some of the noble potential of their draconic sires? Would they simply go violently

into history's night, a footnote of corruption doomed to extinction?

PHYSIOLOGY OF THE DRACONIANS

As scaly bipedal creatures with claws, snouts, and tails, draconians superficially resemble lizardfolk or troglodytes. In truth, they bear a closer relation to their draconic progenitors than to humans or reptiles. This becomes more obvious when examined internally, for a draconian is a dragon forced into humanoid form. Most possess wings like dragons, share the same ocular structure that gives dragons their exceptional eyesight and darkvision, and rely upon the same heightened auditory and olfactory senses. Draconians even possess many draconic glandular systems such as the *draconis fundamentum*, a gland attached

to the heart and central nervous system that regulates and charges the draconian's body with the elemental power inherited from its dragon "parent." As a result, draconians are immune to almost all pathogens and can survive for long periods with very little food or water.

The draconian creation process, however, sabotages this otherwise delicately balanced internal physiology. When a draconian meets its end through violent means, magical forces erupt within the draconian and cause the *draconis fundamentum* to essentially overload. Sages know this phenomenon as a draconian's death throes, which presents a particular danger for any opponent who slays a draconian enemy. The specific nature of these death throes, and other distinguishing

THE DRACONIAN CREATION RITUAL

By all accounts, Takhisis only entrusted the secret of creating draconians to Dracart, Wyrllish, and Harkiel. Historians report even earlier experiments, however, and almost all of them failures. The true ritual involves vile incantations and prayers to Takhisis, chanted in unison by a dark priest and an evil wizard, preparing the egg of a good dragon placed upon an altar consecrated to the Dark Queen. At the climax of the ritual, the saliva of an evil dragon provides the final essence of corruption, harkening back to Takhisis's defiling of the first five dragons. The number of draconians produced always depends on the type of dragon. Brass eggs produce as many as twenty baaz, while a gold egg yields only one or two auraks.

characteristics, vary from one breed to the next.

Although only one race, there exist five different breeds of draconian, one spawned from each type of metallic dragon.

Baaz: Baaz draconians are the shortest and most capable of passing as other humanoids—with a little help from cloaks and masks. Their scales are brass colored, acquiring a greenish-brown patina as the draconian ages. Baaz frequently display ramlike horns or thick curving plates around their skulls, reminiscent of the brass dragons they're spawned from. Their features are considerably less reptilian in appearance than other draconians, with blunt snouts and thin lips, but undisguised they are never mistaken for humans. When a baaz draconian dies, the *draconis fundamentum* causes widespread calcification, possibly related to the brass dragon's stasis-inducing breath weapon. The outward result is that the baaz becomes a stonelike statue that crumbles to dust minutes later.

Kapak: Slightly taller and sleeker than baaz draconians, kapaks have longer snouts and snaggle-toothed jaws. Their whiskers, a mane of thin, dark hair, and softly padded feet give them an almost catlike appearance, but the coppery-brown scales and wings indicate otherwise. Kapaks possess a set of two glands underneath their

tongues, which constantly produce venomous saliva. This, together with the acidic quality of the *draconis fundamentum*, betrays their copper dragon progenitor. When a kapak dies, this caustic fluid reduces the kapak's body to a hazardous pool of acid.

Bozak: Bozak draconians boast broader, more prominent wings and smoother scaled hides than baaz or kapaks. Their bronze scales grow darker as bozaks age, while their claws, teeth, and eyes grow lighter. Along with this coloring, a bozak's flesh and blood are charged with seemingly uncontrolled magical currents. This resonance allows a bozak to more easily align itself with the ambient magic of Krynn, granting it a natural affinity for sorcery. Unfortunately, it also means that when a bozak dies, the draconian's soft tissue, skin, organs, and scales rapidly shrivel as if unable to withstand the unfettered power, causing the bones to explode outward with considerable force.

Sivak: The broad-shouldered sivak draconians easily top 8 feet in height,

making them the tallest of the draconians. Their fully-functional wings, unlike those of the other breeds, permit them the ability to fly as well as glide. Underneath their silver scales sivaks are muscular and powerful, and the transformative magic of their silver dragon progenitors allows them to easily take the physical forms of opponents they slay—often to the horror of those who witness such transformations. Such illusions also take on a morbid cast when sivaks die, as they take on the appearances of whatever beings killed them. These deceptions, however, reveal themselves three days after sivaks die, as their bodies collapse into piles of ashes.

Aurak: Aurak draconians are uniquely wingless and comparatively weaker than the other breeds. As tall as a bozak, the slender, gold-scaled auraks possess many of the same cosmetic features of gold dragons: catfish-like frills and whiskers around the jaw, elongated fangs, and sweeping spiked horns and spines. Arcane magic comes naturally to auraks, even more than with bozaks, as their *draconis fundamentum* acts as a volatile furnace of sorcerous power. By tapping into this reservoir of magical energy, auraks

SAMPLE DRACONIAN WARFAND

The following represents a typical elite draconian warband attached to the Green Dragonarmy, operating out of the desert region of Khur. The Green Dragon Highlord, Salah-Khan, favors kapaks and bozaks, assigning skilled bozak leaders to units of kapak skirmishers and archers. Sakiel's company consists of two strike teams, two groups of archers, and a command retinue.

Sakiel's Company

A relatively small company numbering only thirty-three bozak and kapak draconians, Sakiel's Company excels in swift ambushes and hunting down small bands of enemies.

Command Retinue (EL 11): Sakiel's Company maintains a tightly focused core command of three bozaks, including Sakiel himself (LE bozak fighter 3/sorcerer 2, CR 9, uses a +1 *seeking longbow*). Sakiel's lieutenants Dengath and Torrek (both LE bozak fighter 2, CR 7) each lead a strike team. Sakiel, a deadly marksman in his own right, often commands the archers directly.

Strike Team (EL 13): Kapaks, equipped with scimitars and studded leather armor, make up each strike team. Both teams consist of ten kapak skirmishers (LE kapak rogue 1/fighter 1, CR 6). The EL of a strike team increases to 14 if Dengath or Torrek commands it.

Archers (EL 10): The archer units use shortbows of masterwork quality. Each squad of archers is made up of five kapak archers (LE kapak fighter 1, CR 5). The EL of a band of archers increases to 11 if Sakiel leads it.

Tactics: Sakiel's Company favors missions in rocky badlands, where they can make use of advantages like cover and height. Sakiel arranges his archer units in positions that allow them to cover the advance of the strike teams who then spread out in skirmish formation. One team then tightens up to lead the assault against the opposing forces, engaging once before dispersing. The second team repeats the attack and alternates with the first team while the bozaks cast spells to confuse and hamper the enemy.

direct rays of pure force, transform or alter their physical form, and even slip through extradimensional pockets. Auraks can also release a noxious cloud of gas that atrophies muscle mass and blinds those caught within it. When slain, an aurak combusts, overloading the energy reservoirs stored within its body and causing it to explode in a fiery blast.

PSYCHOLOGY AND SOCIETY OF THE DRACONIAN

As a created race, draconians respond to the social behavior instilled in them as they mature. The Dark Queen's armies intended to use them as soldiers and strict disciplinary methods employed by their superiors ensured that the dragon-men served loyally and efficiently. Before reaching full-size, leaders assign each draconian to a

training group, where it remains until mature. A draconian first sees a member of another breed only when ready to go to war. Their wartime roles therefore dictate the structure of their society.

Ironically, their progenitor dragons bequeathed their strongest and most prevalent social traits to the draconians, albeit twisted by the corruption ritual and its lingering instability. This dark mirror of the souls and personalities of the good-aligned dragons color much of what the draconian experiences and, despite the rigorous social conditioning of their dragonarmy masters, each breed naturally manifests distinct stereotypes.

Baaz and Kapak: Cruelty and cunning are common traits in both of these breeds. Baaz tend to be clanish and subject to forming brute

ADVANCED DRACONIAN

While most draconians advance as fighters, auraks and bozaks often take levels of sorcerer, and kapaks are likely to take levels of rogue. This example baaz draconian is an elite soldier in Dragon Highlord Ariakas's Red Dragonarmy.

squads, a twist on the brass dragon's social tendencies, while kapaks more commonly embody malicious or devious behavior, a perversion of the copper dragon's trickster nature. Neither breed produces above-average leaders, so the dragonarmies typically assign command of a baaz or kapak unit to either a non-draconian or a draconian of a different breed. Attitude with regard to structure and rank provides the key difference between the two: the self-serving baaz find strength more impressive than titles, whereas kapaks like to follow orders and rely on the tactics of their assigned superiors.

Bozak: Bozaks make exceptional sergeants, lieutenants, and political officers. Their training includes a significant amount of spiritual education, and most bozaks learn from their educators that their innate spellcasting powers come from devotion to Takhisis. Combined with a love of psychological warfare inherited from

their bronze dragon parentage, bozaks exhibit a sense of earned authority over the lesser draconians. Many feel their gifts bring with them a tremendous responsibility and their role is one of faith as well as leadership.

Sivak: Like bozaks, these draconians make effective leaders and commanders. They are fewer in number than all but the aurak draconians, and this makes them a precious commodity in the eyes of the Dragon Highlords. Sivaks train intensively and undergo rigorous conditioning. When twisted into a sivak, a silver dragon's deep affection for mortals becomes an obsession with espionage and covert activity, sometimes leading them to assassinate and impersonate the enemy. Most sivaks know that their assignments demand restraint and prudent action, and act accordingly.

Auraks: The least common of the draconian breeds, auraks are also the most independent. Few in number, immature auraks grow up in small,

focused training groups of three or four individuals. Intelligent and insightful, an aurak quickly learns that it occupies the top rung of draconian society. Each develops a feeling of superiority and privilege, a twisted remnant of the gold dragon's nobility and sense of purpose. Auraks thus master strategy, manipulation, and politics, never happy unless they are controlling something or someone.

While many of the draconians who survived the War of the Lance struggled with both their innate natures and the cruelty ingrained within them, their place in Krynn remains in question. Dark powers seek to control draconian hearts and many of even the most forgiving races refuse to forget the atrocities committed by draconians during the War of the Lance. Thus, the future of the draconian race seems to be one doomed to hatred, strife, and the purpose they were created for—war. ☐

FULL FRONTAL NERDITY by Aaron Williams

<http://archive.gamespy.com/comics/nodwick/ffn/ffn.htm>

Black Dragons

“Hatred drives them like a barbed whip, pushing them ever forward to wallow in the toils of sadism and evil.” Thus draconic scholar Atarvex described the race of black dragons nearly nineteen millennia ago. His account seems apt, all these centuries later. Sadists even beyond the cruelties attributed to the frightening reds, black dragons seem to gain greater sustenance from the sufferings of others than the food consumed by other creatures. They perform their evil acts for no greater reason, it seems, than merely to cause hurt.

—*Drakanav Codex*, Chapter 11

Sociopaths and murderers of the worst sort, black dragons terrorize their territories with a fury few other dragons bother to muster. The dragon kind most likely to rampage, black dragons combine the short tempers of their white dragon cousins with a superior intellect and greater physical prowess. Cruel in ways their less-intelligent kin cannot contemplate and far less sophisticated than the greater chromatics, black dragons delight in causing physical and mental pain. These horrible sadists use their frightful presence and acidic breaths to crack minds and burn bodies, all the while cackling gaily and reveling in the despair and torment they create.

Black dragons are the epitome of villainy, committing evil for evil's sake, and they require no greater motivation to pillage and plunder than simply because they can. Where white dragons lash out from a sense of frustration and red dragons launch into their murderous rampages in order to exert their dominance, black dragons kill because they want to. Some black dragons find offense in the most innocent comments and consider every real or imagined

slight (and black dragons possess inventive minds) justification enough to cause localized genocide. Attempts to communicate with black dragons require continuous and unending supplication and groveling, and even then most creatures that try end up as captives, subjects of bizarre but unmistakably creative tortures, or food.

Possessing distinctively large curving horns growing out the sides of their skulls just behind their jaws, black dragons strike impressive and easily recognized silhouettes. Aside from their iconic horns, black dragon faces possess as much individualism as those of any other dragon kinds. Most black dragons grow many smaller horns and hornlets all around their heads and faces, while a small number only gain their two major horns and no others. A few black dragons deliberately crack or break their horns (causing themselves considerable pain) and then let the sharp protrusions heal at jagged and unnatural angles. Black dragons tend to have relatively short necks and tails and thick, muscular bodies. Most black dragons' toes are connected by thick membranes of webbed skin that help them glide through the brackish waters of their homes.

ECOLOGY AND SOCIETY

According to a quip made in the margins of the original *Drakanov Codex* and subsequently repeated in all later copies, black dragons live in swamps because no other kind of terrain would take them. Like their unwelcoming homes, black dragons do not treat well those creatures unused to their many and subtle dangers. Black dragons are the undisputed masters of their territories, partly because few creatures care enough about swamps to fight the dragons for control.

Although they live comfortably in ever-damp morasses, like other dragons, blacks prefer dry lairs in which to sleep. This push for a home above the water level of their swampy demesne drives black dragons to lair in unusual places, such as within the roots of immense mangrove clusters or in the boughs and canopies of cypress groves.

Within their quaggy homes, black dragons reign supreme in a way few other dragons can. They are almost always the undisputed masters of their domains, and even those few swamp-dwelling creatures that could challenge them do not bother. Most victories over black dragons are costly at best and pyrrhic at worst. The acidic breath of black dragons leaves unhealing scars on their enemies, while their sadistic cunning constantly invents new and terrible ways of inflicting pain and suffering on those who oppose them. Even in death, black dragons can strike at their enemies, in the form of carefully laid traps, contingency plans, and the actions of cowed humanoids still under their control.

Black dragons torment their environment in much the same way they torture intelligent creatures. Like the

pitiful creatures that somehow survive their sadism—even for a short while—the lands around black dragon lairs bear horrible scars and vast areas burned clean by acid, never to heal again. Except for whatever copse or grove the dragons call home, the lacerated trees near their lairs twist and writhe in sad imitation of animate things attempting to flee. Through careless pogroms and occasional genocides, black dragons drive off or slaughter all living things surrounding their lairs, creating wide swaths of barren swamplands. Those learned in the ways of dragons who find themselves suffering the misfortune of traveling through marshlands know at once when they arrive near black dragon lairs, for the teeming life of the ever-buzzing swamps suddenly quiets and the explorers come into a vast clearing, at the center of which stands a copse of trees, an outcropping of rock, or some other high indicator of dry land. Many scholars speculate that black dragons clear the lands around their lairs out of a sense of paranoia, so they can easily spot those who would approach their homes. Other sages of draconic lore argue that black dragons kill all life around their lairs simply out of uncontrolled hate. The dragons themselves remain silent on this debate.

When black dragons dine, the ground around them sizzles with the burning of acid as it slavers on all things nearby. Like all dragons, black dragons can survive on omnivorous diets of animal meat and various swamp plants, but they prefer the flesh of intelligent creatures, particularly those still alive and begging for mercy. More stalwart beings who do not scream out or who call out instead for a swift death take some of the dragon's pleasure, and to make up for it the monster usually tortures such victims for days or weeks to make the meal at least somewhat satisfying. Black dragons kill more creatures and rip up more plants than they can eat, and their wasteful and reckless ways do unending harm to the swamps they call home.

Black dragons prefer the brackish tides of saltwater swamps over the gently flowing currents or stagnant stink of fresh water. Many survive on fish and pool-dwellers brought inland by the rhythmic pulsing of the tides. In general, black dragons allow such rich tidal zones to live unmolested, founding their lairs several miles inland, away from their best hunting and scavenging grounds.

No one wants to interact with black dragons, especially other dragons (including members of their own kind). Both physically and socially noxious, black dragons repel those who approach them. While individual black dragons can sometimes overcome their own instincts and form short-lived alliances with other intelligent creatures, these truces rarely end well for the other party, and the list of creatures willing to ally with black dragons grows shorter every century. For their part, black dragons hate

all creatures, often including themselves, and they only subdue their loathing in order to gain an advantage.

In general, black dragons see intelligent neighbors as competitors and enemies or else potential prisoners and servants. Many black dragons who share their swamps with lizardfolk or boggards become leaders of the primitive tribes. Some black dragons transcend mere worldly leadership and are seen by their neighbors as nigh-unappeasable gods to whom they offer sacrifices of living, thinking creatures (usually prisoners but in desperate times members of their own tribes as well).

Black dragons avoid their kin, and other dragons avoid them. In the rare convocations of dragons, few black dragons receive invitations, a situation that suits most of their kind but angers the few who wish to participate. They most frequently interact with bronze and green dragons, as bronzes occasionally live in coastal areas bordering swamps, while greens infrequently live in tropical jungles that sink into swamplands before connecting with seas. Almost without exception, whenever black dragons meet dragons of other kinds, the confrontation becomes violent. When they interact with bronzes, black dragons always try to gain an early advantage by attacking from ambush. In situations where surprise proves impossible, they rarely hesitate to flee from the more powerful bronzes. Against greens, black dragons occasionally attempt to deal peacefully with their physically and mentally superior cousins. These attempts at nonviolent negotiation and discussion rarely end well, as black dragons lack patience and find offense or insult easily. Only when dealing with red dragons (even those they could obviously overpower if they felt brave enough) do black dragons

attempt to govern their short tempers and propensity to attack without provocation. Fortunately for the impatient and hate-filled black dragons, their interactions with reds are extraordinarily rare at best.

Occasionally, pairs of black dragons come together and engage in what look to outside observers like fierce, bloody duels. During these day-long battles, the dragons attack one another relentlessly in flurries of spattering acid and flashing claws. As the sun sets, one of the dragons slinks away and disappears into the ruin left in the wake of their battle, while the other loudly declares itself to the swamp's many inhabitants. These horrible conflicts, easily heard from miles around and avoided by all creatures of the swamp, result in a clutch of eggs roughly 17 months later. In all cases, the crowing victor of these battles, who declares his blood-soaked virility with ear-pounding roars, is the male. The slinking "loser" is the female, who slips away to return to her own domain and begin the process of readying for her eggs, letting the male attract attention to himself while she nests in safety. After mating, the male has no more connection with the female or her eggs, and if ever again the two meet, they treat one another as bitter and hated enemies. Females can lay eggs roughly a dozen times in their lives, and every time they do so it is with a different male partner.

HOARD AND HOME

The greatest treasures black dragons possess are living, thinking creatures. Black dragons keep prisoners whenever possible, usually chained or caged near enough to their submerged coin beds for their hot, noxious breaths to wash over their captives. Those prisoners able to speak plead for release and beg for food almost constantly, for they quickly

learn that groveling captives tend to remain living captives. Prisoners too tired or simply unable or unwilling to soothe their captors' acidic personalities quickly become sport or food. For the prisoners of black dragons, the line between prized treasure and snack is a very thin one, but the wiliest of captives can live for years under their masters' watchful and jealous eyes. No prisoners escape injury for long, as black dragons are known to vent their wrath on whatever living things are closest at hand. Within a few months, every captive bears acid scars.

Thanks to the inhospitable nature of their native environment and their own hated

personalities, black dragons can rarely find intelligent creatures to capture and torment. They consider swamp-dwelling humanoids such as lizardfolk and boggards to be slaves and servants, and do not count such creatures as treasure. To black dragons, treasured captives include humans and elves (who they especially love to scar with their acidic breath), as well as other intelligent creatures of similar size. As a result, they make for especially prized captives, while gnomes and halflings are considered insignificant refuse.

For non-living treasure, black dragons prefer items that can withstand their acidic breath, such as precious stones and glasswork. They disdain most metals, not only because such materials succumb easily to their breath, but also because the ever-present dampness of the swamp further corrodes all but gold, platinum, mithral, and adamantine. Thus, the coin beds and hoards of black dragons consist largely of gold and platinum coins, although black dragons do keep lumps of silver and copper coins corroded together in places other than their coin beds.

Black dragons ascribe no value to art and generally consider beautification as wasted effort. Those pieces of art and fine jewelry that do come into their possession survive only a short while before corrosion, acidic damage, or active defacement occurs. This disdain for beauty carries over into the prized possessions of black dragons as well, and many formerly attractive captives who escape emerge with hideous scars across their faces, which they describe as punishment for being beautiful—though perhaps the dragon's standards of beauty are so vile that by making things hideous it feels it is improving the value of its treasures.

Black dragons seek out stone statues and cut crystals to add to their hoards. Black dragons show no preference to the style, subject, or composition of the statues they collect, although they deface or vandalize works they consider too attractive. For crystals, black dragons prefer quantity over quality and size over value. Massive quartz crystals several feet long appeal more strongly to black dragons than do flawless but tiny diamonds. The stone and crystal collections of the oldest black dragons can sometimes compare with the greatest princes of the Elemental Plane of Earth. Although they seldom have much use for such items, black dragons particularly prize magical stones, crystals, and glassworks (such as mirrors or orbs), and place such items in prominent positions.

Black dragon lairs vary greatly, thanks to their environment and the wildly divergent topography therein. Like all dragons, they prefer to live within natural caverns or otherwise inside protective structures, but in general caves of sufficient size are extraordinarily rare in swamps. Usually, the best black dragons can muster are crevices within stone outcroppings or else sheltered indents in cliffs or steep hills.

Many black dragons live in unsheltered locations above the water level of their swamps. The boughs and canopies of cypress groves and the extensive twisting labyrinths of mangrove roots commonly act as their lairs and resting places, generally with extensive modifications made for them by lizardfolk allies or boggard slaves. Black dragons frequently employ lizardfolk and boggards, through coercion and threats, as guardians for their lairs, particularly in these relatively exposed examples.

Around their lairs, black dragons and their slaves set up numerous traps hidden beneath the dark waters of the swamps. These primitive but remarkably effective traps generally consist of spiked pits, fields of concealed spikes, deadfalls, and simple tripwires. Generally, the static defenses around black dragon lairs extend as far as the lifeless clearings surrounding their homes, significantly slowing already exposed land-bound trespassers.

To stave off airborne attacks, black dragons wrap the trees around their lairs with ropes or vines. Creatures attempting to fly into lairs protected in this way often become enmeshed or otherwise stalled by the ropes and vines, trapping them or sending them crashing to the ground. In order to avoid surprise from the air, black dragons often enlist the aid of spotters from among the lizardfolk or other creatures of the swamp.

The heavy stones and precious metals that comprise black dragon hoards tend to sink quickly in the swamp. Because of this and because their lairs are often open, black dragons are unique among true dragons in that they sometimes keep most of their hoards in places other than where they sleep. Black dragon treasure vaults are always carefully concealed and heavily guarded with a number of passive defenses. These vaults are usually artificially constructed by the dragons and their captives (who are then eaten so they cannot share their knowledge) deep within the still-living sections of the swamps. Vaults rarely stand farther than a mile from the dragons' lairs, and many are within a few hundred feet of the clearings around their homes. Black dragons prefer to be able to see their vaults from their lairs (or when flying over their lairs), but such a luxury is not always possible.

CAMPAIGN ROLE

Black dragons are unsubtle in their hate. They attack without provocation and fight with a terrible ferocity. Hardly heavy thinkers, black dragons are inclined to fight directly, bringing the battle straight to their opponents with acidic breath and flesh-slicing claws. Unlike their white cousins, though, black dragons are not cowards, and they do not back down from any non-draconic opponents. Their draconic pride keeps them in fights they cannot win, except when pitted against obviously superior fellow dragons.

Black dragons do take and keep prisoners, especially in the form of tribute from local tribes, passersby, or villages within a half-day's flight. Foes of other races they simply kill or, more often than not, leave for dead. Black dragons exert their cruel creativity in the uncounted wondrous tortures and torments they devise. The least creative among them simply allow their acidic saliva to drip onto their victims, slowly tracing acid burns into soft humanoid flesh. While this remains effective and frequently practiced, older and more sophisticated black dragons consider that form of torture too simplistic and scarcely worthy of the term. More practiced, older black dragons prefer slower forms of torture, extending the sadistic glee they derive from watching other creatures suffer. Many use water in their practices, including allowing drops to fall on their victims' foreheads at irregular intervals or simply dunking their victims underwater for several seconds at a time. Some are lazy and have their prisoners torture each other while the dragon watches. Regardless of the methods used, black dragons rarely ask questions of their victims, and practice torture only for their own enjoyment.

Usually the most dangerous hazards in the most hazardous of terrains, black dragons are often the entities responsible for whatever foul reputations certain swamps might have. Those who encounter these near-legendary nightmarish dragons that torment accursed swamps rarely survive unscathed—if the dragons' acidic saliva doesn't affect such victims, the psychological trauma of their oft-dramatic entrances almost undoubtedly does. When black dragons do deign to attack intruders in their swamps, they always aim to leave a significant impression upon the trespassers. Many leap suddenly from the dark swamp waters, while others drop out of thick canopies of trees or erupt from mounds of vegetation.

ON GOLARION

Although it is the largest swamp in Avistan, relatively few black dragons live in the Mushfens. Most dragons avoid the area and control smaller swamps along the northwestern coast of Cheliaz and the northern and eastern coasts of Lake Encarthan. Numerous flooded lowlands in the various River Kingdoms also play host to black dragons, many of whom establish defensive pacts with whichever short-lived lord or princeling hopes to claim the territory that year.

The Mushfens, though, make most black dragons nervous. Racial history among their kind recalls that long ago the humans of the area discovered ways to control and pacify their unfortunate ancestors. For centuries, black dragons served the humans of Thassilon as guardians, pets, or—worst of all—heavy laborers. When Thassilon fell, the black dragons fled the place, vowing never to return. Millennia later, though, a few black dragons did

go back, and those foolhardy few (as other black dragons consider them) have established themselves as masters of their particular domains in the vast Mushfens. This bizarre learned fear, however, is made all the stranger because the Mushfens did not exist during the time of Thassilon—the area only became a vast marsh when Eurythnia sank into the ocean. Black dragons consider this fact unimportant, however, and are inclined to violently lash out violently at those who push the point.

Unlike their more impressive cousins, few black dragons gain notoriety enough to warrant fame outside their immediate areas of control. Seryzilian of Ustalav ranks as one of the most famous black dragons currently active in Avistan, but he and his contemporaries lack the fearsome reputations of their ancestors. Indeed, with each passing millennium, it seems the terrible sadistic fury of black dragons wanes more and more. The histories of humans and dragons alike record the terrible activities of black dragons past—such as mighty Theratylus, who slew an army of 10,000 (human records put the army's size at 2,000), or sly Esaolathus, who tricked a Taldan baron into granting him hunting rights over the entire barony and then quite legally killed every man, woman, and child living therein—but bards rarely sing of their more recent descendants. Many draconic scholars debate the decline of black dragons, but most agree that the spread of human civilization and the undeniable drag of inbreeding hamper modern black dragons in ways their ancestors never faced.

NAMES

Black dragons favor long but easily pronounceable names, particularly those with an abundance of the “s,” “th,” and “z” or “zh” sounds, coupled with extensive use of the various sounds for “o” and “u.”

Black dragon names: Asorazaklyn, Drakzuul, Karazathak, Sarolozoth, Throkzuun

SERYZILIAN

Terrible Seryzilian haunts the tiny swamp north of Karcau in northeastern Ustalav, where he torments the impoverished people of that land with unexplained abductions carried out in the dark of night and mutilated corpses of cattle bumping against the city's piers. The exact nature of Seryzilian remains a mystery to the humans who live near him, and many speculate he is a ghost or other foul undead, never believing that a living creature could perform such terrible acts unseen and ever hidden.

For his part, Seryzilian delights in the confusion of the humans, but he himself knows that some darker menace also plagues the swamp. His attempts to contact or summon whatever unknown entity lurks within the swamp have thus far failed, and with each new frustration he exerts his anger anew upon his bewildered and beleaguered neighbors.

3rd (7/day)—fireball (DC 17), haste, lightning bolt (DC 17), vampiric touch

2nd (7/day)—darkness, glitterdust (DC 16), scorching ray (DC 16), shatter (DC 16), web (DC 16),

1st (7/day)—cause fear (DC 15), chill touch, color spray (DC 15), magic missile, ray of enfeeblement

0 (6/day)—arcane mark, detect magic, detect poison, ghost sound (DC 14), mage hand, mending, message, prestidigitation, open/close

TACTICS**Before Combat** When he knows of an approaching enemy, Seryzilian readies himself by first slipping under the waters of his home. Carefully and quietly, he approaches his prey and watches them for a time, learning what he can of their strengths and weaknesses through their conversations and displayed abilities. When the time of his attack comes, he attempts to distract his foes with illusions.

CR 20

NOXIOUS BITE

Your acid-dripping breath causes those you bite to become ill.

Prerequisites: Acidic breath weapon, bite attack.**Benefit:** Your bite attack deals 1 point of acid damage in addition to its normal damage. Living creatures you bite must make a Fort save (DC equal your breath weapon's DC) or be nauseated for a number of rounds equal to 1 + your Constitution modifier (minimum 1 round).**During Combat** Seryzilian begins combat by leaping suddenly out of the water to catch his prey by surprise, then sprays his terrible breath on as many foes as he can.

On his next turn, he makes a full attack, concentrating all of his attack on one target at a time. Each round, he randomly changes targets, making as many attacks as possible against that single foe, only attacking additional opponents if his target drops, and using his breath weapon whenever it becomes available, hitting as many opponents as possible with each breath. Seryzilian only uses Power Attack if an enemy appears particularly easy to strike. He prefers greater accuracy over more damaging attacks, especially when attacking with his Noxious Bite.

Morale Seryzilian fights to the death. His draconic pride and love of battle work against his sense of self-preservation.**STATISTICS****Str** 35, **Dex** 10, **Con** 25, **Int** 18, **Wis** 19, **Cha** 18**Base Atk** +34; **Grp** +58**Feats** Alertness, Blind-Fight, Cleave, Flyby Attack, Hover, Improved Initiative, Improved Natural Attack (bite), Noxious Bite, Power Attack, Snatch, Weapon Focus (bite), Wingover**Skills** Escape Artist +37, Hide +37, Intimidate +37, Knowledge (nature) +37, Listen +39, Move Silently +37, Search +37, Sense Motive +37, Spot +39, Swim +37**Languages** Abyssal, Aquan, Common, Draconic**SQ** water breathing**SPECIAL ABILITIES****Water Breathing (Ex)** Seryzilian can breathe underwater and freely use all of his abilities while submerged.**Corrupt Water (Sp)** Once per day, Seryzilian can stagnate 10 cubic feet of water, making it become still, foul, and unable to support animal life. The ability spoils liquids containing water. Magic items (such as potions) and items in a creature's possession must succeed on a DC 15 Will save or become fouled. This ability is the equivalent of a 1st-level spell, with a range of 330 feet.

Blue Dragons

A note to would-be dragonslayers: you will never fight your way through the layers of intrigue to strike down the blue dragon at his heart. You will most likely never meet the blue dragon manipulating your lives. The only time you will ever meet a blue dragon you wish to slay is when he makes an error.

They are more than content to shift pursuers off their trails and wait the fifty years or so for their human antagonists to simply die. They never grow so frustrated that they venture forth to eliminate threats in person.

—*Drakanav Codex*, Chapter 12

Blue dragons share many commonalities with brases, and the two kinds of dragons frequently compete for water, food, and influence over nearby humanoids. The two take remarkably similar approaches to dealing with water and food, although blues are typically more controlling than their metallic rivals. What varies between these kinds is how they exert their power over their humanoid neighbors. Where as brass dragons form vast networks of friendly and casual connections with people of similar interests, blue dragons maintain smaller but better-controlled webs of contacts over whom they can directly or indirectly exert vise-like authority. In short, where brass dragons are socialites, blue dragons are puppet masters.

Neurotically, almost obsessively tidy, neat, and careful, blue dragons manage every aspect of their lives to a minute level. This desire to control manifests from the moment of their hatching and is not limited to external forces, actions, and creatures. Blue dragons also strive to remain stridently in control of themselves—their own actions, thoughts, and

even their own feelings and emotions. Unfortunately for the blues, they lack the natural predilection for discipline possessed by their green brethren. Most blue dragons find this deficiency of self-control an exhilarating challenge for them to micromanage out of existence. When they become so tightly wound as to snap, rather than launch into self-destructive rampages, blue dragons seethe in their thrones and mobilize their armies. In the language of Qadira, the saber-rattling that often occurs before the start of outright war is known as *al-dra aksu*, “waking the dragon,” in reference to the belief that most wars in the desert begin because blue dragons want them to happen.

As befits their sand-burrowing ways, blue dragons are sleek, muscular creatures with small, tightly overlapping scales and thick, short claws perfect for digging. Their swept-back horns and relatively small and sparse cheek hornlets add to their swift-moving appearance, such that even when at rest they seem in motion. The wings of blue dragons have thick scales on their leading edges, which protect the relatively delicate membranes of their leathery wings from stones while they burrow. Unlike most other dragons, blues can also fold their wings tightly to their sides, which prevents the wings from acting as obstacles to movement through the sand.

ECOLOGY AND SOCIETY

Blue dragons most often inhabit the edges of hot, arid deserts, preferably near crossroads, oases, waystations, or other places where humans gather or frequently pass by. Whenever possible, blue dragons control these vital locations, generally through intermediaries, allowing them to also exert influence over the creatures that rely on the places. Like almost all dragons, blues like to live within dry caves, which are common amidst the badlands, hills, or broken rocks that form natural borders of their desert homes. Many blue dragons live in the homes of brass dragons, once they drive off or kill the previous occupants.

Although one of the least playful of true dragon kinds, even among the taciturn and joyless chromatics, blue dragons do enjoy swiftly burrowing through desert sands. Blue dragons engage in these sand swims for a variety of reasons. Many go off into the deep desert for solitude, giving them time and clarity to work out some trouble that vexes them. Some swim in the hot sands simply for pleasure, as the close grains envelop them in a massaging warmth. As blue dragons age, they sometimes grow hornlets, bone spurs, or other unsightly protrusions on their faces and at their joints; swimming through the irregularly sized grains of desert sand polishes their scales and grinds away the unprotected growths.

Above the ground, blue dragons delight more in aerial combat than any of their kin. Thanks to the strong lungs that allow them to find air even when burrowing under

thousands of tons of stone and sand, blue dragons can fly higher than any other true dragons. When they hear of other, non-blue dragons in their territories, they do not hesitate to take to the air and spy upon the trespassers from high above, circling gently in the rarified air far above the flight ceiling of their kin. If the trespassers have metallic scales, the blues dive down and immediately attack, trusting to their often-superior maneuverability in the air to defeat metallics weaker than themselves or escape from those they cannot hope to defeat. When blue dragons meet to discuss business or political proposals, they often open negotiations with relatively friendly competitions of aerial combat. They first agree upon the terms of the opening battles before they begin, with the losers entering the discussions from a position of weakness.

Relentless carnivores, blue dragons refuse to willingly eat vegetable matter, calling it “cattle food” to those who might suggest such a thing. If hunger gnaws too strongly at their stomachs, blue dragons can gain sustenance from minerals and nutrients trapped within stone and earth. Many blues stave off hunger by finding areas of sand relatively rich in nutrients, swimming through the area and allowing small amounts of the sand to filter into their mouths through their clenched teeth. Many sages speculate that this process is also necessary to generate their lightning breath weapon.

Although they habitually opt out of advanced magical techniques and knowledge, blues nonetheless retain the impressive retinue of inherent magic common to all true dragons. They most often focus their magical acquisition on spells and magical items concerned with deceit and manipulation. Blue dragons favor the schools of illusion and enchantment above all others, and while they have natural talents with illusory effects, their tendency to control all aspects of their lives makes them also favor spells of charm and domination.

Blue dragons produce more half dragons and dragon-blooded offspring than all other dragon kinds combined, usually created by altering a creature with draconic blood rather than actual mating. These creatures serve as loyal lieutenants or trusted operatives. As blue dragons tolerate no disloyalty from their half-breed minions, all half-blues are exceptionally dedicated to their draconic parents. This trait they teach to their own descendants, although those generations further removed from their blue dragon ancestors become increasingly independent and prone to familial betrayals.

Blue dragons are loath to reveal themselves or their direct influence. They know that brass dragons and other high-minded creatures hate and fear them, and they exert great amounts of energy to remain hidden from those who might otherwise become their enemies.

Because they lack the natural ability to change their forms, blue dragons must rely on other creatures—preferably humans but any creatures either of the humanoid form or who can physically change their shapes—for the maintenance and direct supervision of their vast networks of contacts. Younger blues usually employ only one or two of these seneschals or lieutenants, while the oldest great wyrms might command a dozen or more. Cultivating these trusted lieutenants requires at least several years. Generally, a future lieutenant begins at the periphery of a blue dragon's network of contacts and slowly works his way up the chain of command and ever closer to the dragon resting at the heart of the elaborate web. Blue dragons rarely take the time or expend the effort to know all of their underlings, trusting instead that their lieutenants can handle the daily operation of their vast networks. Once a minion proves his worth and advances sufficiently high in the chain of command (usually within three or four steps of the dragon himself), one of the blue's lieutenants mentors the follower and grooms him for his continued rise. When a blue loses a lieutenant, whether through the passage of time or misadventure, he advances an underling mentored by the fallen lieutenant. Naturally, a minion who attempts to advance by killing his lieutenant faces his enraged blue master instead.

In general, only a blue dragon's direct lieutenants know of his true form and location, although truly exceptional underlings relatively close to the dragon also occasionally uncover or meet his identity. Most of the minions in a blue dragon's network of spies and contacts never learn of their true master. Only the blue dragon himself knows the true scope of his network, although his lieutenants generally know at least one other creature of their rank, in addition to most or all of those who work beneath them. Usually, lieutenants do not know the number of their fellows, and in many cases a blue attempts to convince each one that he is the only creature the dragon trusts that closely.

Blue dragons see some amount of camaraderie in their green cousins, with whom they share discipline and an adherence to order. While green dragons have a tendency to focus their energies internally, blues manifest their personal codes of honor and discipline externally, controlling their surroundings and neighbors. Most blue dragons respect and attempt to emulate the self-discipline of their green cousins, but many fall frustratingly short. In addition to greens, blue dragons also respect and willfully work with reds. Although the chaotic and unpredictable nature of their red kin causes them frequent difficulties, blue dragons nonetheless recognize the value in possessing allies of such magnificent power. To that end, blue dragons sometimes carefully employ themselves as advisors to reds, and red dragons who control vast territories more often than not have blue dragon lieutenants who carefully work

to engender continuing dread in the local populace. By using red dragons as public figureheads in this manner, and keeping public attention fearfully fixed upon the powerful reds, the blues can establish and operate ever-larger networks of underlings and lackeys with much less fear of discovery. With the two lesser chromatic kinds, blue dragons have no dealings.

Blues struggle endlessly with their brass dragon rivals, vying not only for land, but also for contacts and underlings. In some uncommon cases, a blue and a brass might both count on a particular creature as a contact, who might unknowingly work for both dragons at once thanks to the long chains of intermediaries separating him from his two masters. Blue dragons particularly enjoy placing paladins and other virtuous creatures into this situation of dual servitude. Generally, though, the matrixes of underlings employed or otherwise directed by blues and brasses rarely overlap except in violent ways. Through their networks of contacts, blue and brass dragons sometimes wage proxy wars lasting for decades.

Among their own kind, blue dragons generally work together in mutually beneficial ways. By chance or design, groups of blues sometimes cluster together, with their areas of influence abutting one another peacefully. These groups of blue dragons very carefully and precisely define the borders of their territories, often putting such definitions in writing. Border wars between blue dragons are therefore exceedingly rare, although blues do occasionally fight proxy skirmishes against one another for other reasons. Crossing from one blue dragon's territory into another is seamless, and no creatures except the blues and their lieutenants can clearly define when such a transition occurs. The areas controlled by different blue dragons usually ignore the borders established by humans, which occasionally leads to civil wars and border disputes among the humans as the dragon exerts its influence. For the most part, though, wars disrupt the trade routes on which blue dragons typically depend, such that desert regions blanketed by blue dragons are almost always more stable and wealthier than those that are not. Of course, these areas tend to gain stability through despotism, although few of the people living therein suspect that they actually live under the control of two tyrants—one human, one draconic.

HOARD AND HOME

Blue dragons favor expansive lairs with several layers of complexity and serving multiple functions. A blue dragon's ideal lair stands publicly in the center of a city, such as a temple, fortress, or other large but privately owned building, usually possessed in the name of the blue dragon's most trusted lieutenant. Beneath this legitimate and functional façade wind dozens of hidden passages and

tunnels, themselves serving some darker purpose (such as the headquarters of an assassin's guild, also indirectly controlled by the dragon). Beyond these, either physically beneath or simply farther away, the tunnels open into vast natural caverns the dragon calls home. Blue dragons are not stupid, though, and their cavernous homes always have hidden exits that lead directly to the surface.

Such ideal lairs characteristically belong only to extremely old and well-established blue dragons, who spend their long lives building up webs of contacts that span multiple generations. A very few exceptionally lucky younger blue dragons inherit such extravagant lairs from their parents, but because of the longevity of their race, few dragons care to wait for such boons. In general, blue dragons begin with less ideal lairs and slowly and steadily build up their size and grandeur over time.

To start, many blue dragons find brass dragons (who bear an exceptional aptitude for finding excellent natural lairs) and steal their lairs. When these lairs contain natural outlets of fresh water, the blue dragons leverage water rights into ever-increasing control and profit for themselves. Over time, through their lieutenants and intermediaries, blue dragons sometimes coerce semi-nomadic peoples to settle near their lairs, using the water found therein as the basis of their newfound villages. Truly fortunate blue dragons instead find fanatics of some kind who are willing to establish bases of operations atop or near their lairs, using the water there to exert control over nearby people. As their settlements grow, so too do the buildings that form the public portions of the dragons' lairs, with the dragons themselves moving farther away from their public epicenters as they extend the size of their chains of informants and contacts.

With the use of magic and direct informants, blue dragons carefully monitor their lairs and the activities occurring within them. Every power group that exists within a blue dragon's lair reports through the group's leader directly to one of the dragon's lieutenants.

Blue dragons put much of their accumulated wealth into the growth and decoration of their lairs. From gilded domes to exquisite marble statuary,

the extended lairs of blue dragons contain unimaginable treasures that dragon-slaying mortals cannot hope to loot. Thus, although they are easily the wealthiest dragons, the portable portions of blue dragon hoards are no more impressive than any other dragon's.

Because of their constant need to buy loyalty and bribe bothersome bureaucrats, blue dragons prefer to keep their wealth in forms both easy to carry and easy to spend. Coins form the basis of their hoards, and the coin beds of blue dragons are usually far larger than their relative size and power would otherwise dictate. In addition to coins of all kinds, blue dragons favor gems and jewelry, the value of such items being disproportionate to their size. These items are generally kept separate from the rest of their hoards, so the dragons may use them as payment without needing to access their most private chambers when hosting guests.

CAMPAIGN ROLE

Entire campaigns can exist at the whim of blue dragons without the adventurers ever actually meeting them. Consummate masterminds and manipulators, blue dragons control events from behind the scenes. Only when caught by surprise or betrayed are they disposed to show themselves to those who wish to defeat them. Under no circumstances do blue dragons become frustrated with the failures of their underlings and approach powerful characters in order to take care of

CONVOCAION OF DRAGONS

When a great wyrm gold dragon calls for a gathering of other dragons, even the disobedient chromatics listen. With the exception of the unrepentantly antisocial black dragons, representatives of every draconic kind flock to some neutral location (often an uninhabited island off the western coast of Garund) to discuss, argue, and battle over the topic at hand. Convocations rarely last for more than a few days, and even the longest and most productive of them tend to end in bloodshed and violence. Despite the palpable tension brought about by so much deep animosity pressed into a confined space, convocations of dragons do frequently create some kind of subtle change in pan-draconic society.

The gold dragon Aostralya called the last convocation in 4607 AR, in response to the apparent death of Aroden and the impact on Golarion and its dragons. Although the chromatics took the predictable position of human problems not mattering to dragons, the red dragon Grathalax noted hope for the pan-draconic goal of finding and killing Dahak.

Notable topics discussed at past convocations include the destruction of Dahak (the most commonly raised topic), the rise of Daralathylx and what (if anything) to do about him, the return of elves, and the meaning and implications of Earthfall.

their antagonists themselves. Instead, when groups of troublesome would-be heroes continue to thwart their plans, blue dragons manipulate people and events to subtly but firmly turn the adventurers' attentions elsewhere—even if that means pushing the characters toward neighboring blue dragons.

Exceptions exist, of course, and some blue dragons actually enjoy performing dirty work. These unusual (and often shunned) blues maintain relatively small chains of contacts and control tiny amounts of land—if they control anything at all. These are almost always immature dragons who mistake the gaining of personal power with somehow proving themselves to their elders; they do not wait patiently for their underlings and contacts to neutralize or distract those who disrupt their simplistic schemes, but they instead go forth to confront their problems directly.

Ironically, many of these younger blues are themselves subtly controlled and influenced by older relatives—typically their fathers, grandfathers, or uncles—in order to test their mettle and to weed out undesirable personalities. Those young blues who do give in to the whispered pressures to personally confront their opponents are not the worthy of continued tutelage and mentorship from their older kin, and even if they somehow survive their foolishness, they are frequently cut off from further aid. Thus, most blue dragons

adventurers actually confront are young and relatively inexperienced, and it is rare for mature dragons to give in to such folly.

Many humans blame border wars and conflicts over water rights on blue dragons. Outside of Thuvia, they are correct about half the time. Sometimes, when water wars or border skirmishes erupt, one or more of the human leaders involved send out groups of their own underlings or—preferably—hired freelance adventurers to try to find the blue dragon responsible and bring about an end to the conflict. If blue dragons are even involved, such attempts result only in the deaths of those sent to investigate. History has yet to record a successful bid to end such a war early with the death of a blue dragon, but despite this many humans hope to be the first responsible for such a success.

ON GOLARION

Dragons have taken root in the mountains of Absalom many times over the centuries, though any who grow to adulthood are inevitably put down by heroes and treasure-hunters from the city. Most other blues live in Rahadoun, Thuvia, Osirion, and Qadira. There are a few dozen in Chelias, especially near Garund, but they are otherwise scarce on the northern coast of the Inner Sea because of their great hatred for Andoran.

NAMES

Blue dragon names fall somewhere in the middle of draconic naming schemes in regard to length and complexity. Even the longest blue dragon names tend to be easy for humans to pronounce, as they favor vowel sounds more than other kinds of dragons. Some blue dragon names sound almost elven, and it is not unheard of for blue dragons to grant elven names to their offspring—a practice co-opted by the elves with regard to dragon names only to celebrate a parent's victory over a blue dragon.

Blue dragon names: Aristidir, Hoythus, Olarissilax, Thessylimnias, Warsilix

LOARALIS

There are those who believe that Loaralis does not exist, that she is merely the name given to a string of misfortunes that plague the goodly peoples of Pashow, including the losses of the two most recent *sun orchid* elixir shipments. In whispers spoken among adults and stories told to unruly children, Loaralis is the unseen bogeyman who haunts the city-state and feeds its paranoia.

Loaralis, of course, is delighted that many of Pashow's people dismiss her as a story told to frighten children, for such blissful denial allows her to operate in relative peace, without fear of reprisal from those who might seek vengeance against her. Hidden deep within a

grand vault of worked stone she herself designed, Loaralis coordinates an ever-growing web of intrigues and servants who unknowingly toil for her. Once a day, Loaralis's lieutenants—a cleric of Abadar who serves in the temple above her lair and a mid-ranking city guardsman charged with maintaining order in the streets near her home's urban entrance—report directly to her in her grand chamber deep beneath the city. These two men alone know her true form, and they serve her without question.

Through her competent and trusted lieutenants, Loaralis feeds off the fears of Pashow's populace, gently manipulating both the temple of Abadar and the city guards in her various schemes. Although she had no hand in the disappearance of the last two shipments of *sun orchid elixir* out of the city, Loaralis spares no expense in her efforts to uncover who did and where they took the stolen wares. On at least two occasions, her agents have come tantalizingly close to recovering the elixir or uncovering the thieves, but whoever pulls the strings behind the disappearances so far remains at least one step ahead of her.

Unless gifted with incredible luck or skill, no one can simply walk into Loaralis's lair without one of her agents (and thus Loaralis herself) knowing about it. For all intents and purposes, it is impossible to catch Loaralis off guard in her center of power.

LOARALIS

SPECIAL ABILITIES

Create/Destroy Water (Sp) This ability works like the *create water* spell, except that Loaralis can decide to destroy water instead of creating it, spoiling unattended liquids containing water. Magic items (such as potions) and items in a creature's possession must succeed on a DC 10 Will save or be ruined. This ability is the equivalent of a 1st-level spell, and Loaralis can use it three times per day.

Sound Imitation (Ex) Loaralis can mimic any voice or sound she has heard, anytime she likes (Will DC 19).

Brass Dragons

A brass dragon knows everyone worth knowing in the nearby cities, and many not worth knowing, though they are likely to forget specific names. Do not assume, though, that brass dragons are fools. No, their minds whirl with information and gossip, despite their tendency to lose track of what stories belong to which persons. Still, the parties and feasts they throw are gala affairs, and if ever you should be invited to one, you should make every effort (and then some) to attend.

—*Drakanav Codex*, Chapter 13

Of all the true dragons, brasses are the most whimsical and light-hearted. Many a brass dragon acts the fool, carousing and jesting with shorter-lived races as an equal or—occasionally—even a simpleton. This play at stupidity is usually just a ruse meant to put others at ease and cause them to underestimate the brass dragon's intelligence, which at hatching equals that of an adult human. While brass dragons are not as dim-witted as they let on, they are nonetheless flighty and easily distracted.

Gregarious and absentminded, brass dragons make for memorable patrons or helpers of goodly adventurers, particularly near rocky edges of deserts or in close proximity an oasis. A brass dragon can easily play the role of desert guide, advisor or diplomat for a powerful caliph, or uniquely uproarious tavern patron. Above all else, brass dragons genuinely wish to help others and work extremely hard (in brief spurts of labor separated by long periods of distraction and idle conversation) to mediate or otherwise seek agreement among discordant and opposing groups. Despite their friendly and passive demeanors, however,

only fools assume that brass dragons are harmless or unwilling to strike at those who annoy or anger them.

Brass dragons appear—like their preferred homes—as a mixture of smooth beauty and craggy ruggedness. Thick ridges of keratin just beneath their scales sweep back from their jaws to eventually grow into long, disjointed horns that proliferate as they age. Hatchlings typically have relatively smooth faces with only two horn nubs projecting out above and behind their skulls, while the eldest brasses sport more than a dozen horns extending back from faces so wrinkled and folded with keratin that some become blinded by their own horn ridges (though they normally use magic or their own sharp claws to remedy this problem). Beyond their distinctive faces, these keratin folds appear on the backs of brass dragons' legs, where their wings connect to their flanks, and along the last two vertebrae of their tails. These folds usually produce only tiny hornlets in even the eldest of brass dragons, but occasionally a brass's legs, wings, and tail are studded with curving, slightly crooked horns extending a foot or more in length.

ECOLOGY AND SOCIETY

Perhaps the most gregarious of all dragons, brass dragons enjoy conversation and the company of others. Ironically, they also prefer some of the least hospitable homes of all dragons, subjecting them to long swaths of time wherein they sleep away their boredom. Woe unto those in need of great haste who awaken such a sleeping dragon—not for fear of life and limb, but rather for the time required to entertain the great beast.

The lairs of brass dragons typically exist inside rocky outcroppings in otherwise sandy deserts. They prefer to live within a half-day's flight (or roughly 80 to 120 miles) of an oasis, river, or other source of fresh water. A perfect combination of these factors puts brass dragon lairs along busy trade routes, allowing them to remain in relatively steady contact with human traders and nomads, with whom they exchange information.

Brass dragons are likely to share water resources with travelers in need. This makes them sought-after allies among nomads and caravan masters but can set them at odds with blue dragons or others who attempt to control the flow of water in deep deserts. The Water Lords of Thuvia frequently attempt to befriend or ally with brass dragons in their territories in the often-unfulfilled hopes of controlling the brasses' propensity to freely share information and water. Brass dragons do not forge alliances with known evil beings, and that includes friendly Water Lords with reputations for cruelty, avarice, or lack of compassion.

Even when rudely awakened from a boredom-induced nap and hungry to the point of near-starvation, brass dragons crave companionship and intelligent conversation more than a quick meal. Of course, those foolish enough

to annoy a hungry or freshly awakened brass dragon and not offer interesting discourse find themselves in very real danger of becoming the dragon's next meal. This happens so rarely, though, that among dragon experts brasses are considered the safest breed with which to converse.

In fact, thanks to their love of sharing information—for a price, of course, almost always exacted in the form of knowledge they do not already have—most of what is known about dragons comes directly or indirectly from brass dragons. Because brass dragons are inclined to exaggerate for the sake of a better story, though, scholars of draconic lore must occasionally revise their books when other factual evidence contradicts what was previously “known,” as told by a brass dragon. The most famous case of this to date involves the revision of volume 11 of the *Pathfinder Chronicles*, wherein a naïve Dalanía Pontius recorded as fact a story told to her by the brass dragon Helexa that led—directly and indirectly—to numerous deaths and injuries among the Pathfinders.

Brass dragons tend to get along quite well with their non-evil neighbors. Often considered the friendliest of dragon breeds, brass dragons nonetheless remain self-serving egotists. The brass dragons' particular form of egotism manifests in large, often elaborate networks of contacts throughout their territories, usually consisting of human traders and nomads, djinn, the various sphinxes (especially the androsphinxes, with whom they exchange nonsensical riddles), and other intelligent desert dwellers. Brass dragons enjoy setting up these large and tightly interconnected networks, but they often fail to maintain their allies or remember what subtle manipulations they have performed through their intermediaries. It is not uncommon for allies of the same dragon to oppose one another in missions indirectly assigned to them by the brass.

Some brasses use magic to disguise themselves and thus better fit in with their neighbors, especially humans. Most never bother to hide their true forms and enjoy the notoriety and local fame they gain as a result. Usually, the owners of the taverns, inns, restaurants, and flophouses they frequent welcome the brass dragons and their spendthrift ways, for gaining the reputation as a place patronized by an actual living dragon almost always draws in large crowds—particularly when the dragon visits.

Despite their rampant gregarious natures, brass dragons generally avoid one another directly, although they frequently interact via proxies and their often large networks of contacts, allies, and underlings. Through these long chains of contacts, some of whom two or more brass dragons share, males and females develop their plans to mate with one another, competitors for an area's resources battle in proxy wars (generally with a minimum of casualties, although these conflicts infrequently grow

vicious), and those who seek water trade for rights to the dragons' reserves. These networks almost always contain metallic dragons of other breeds, especially coppers (who are, like brasses, quite chaotic), as the other metallics find the friendly and sociable brasses both personally enjoyable and strategically useful—brass dragons gladly take on the roles of ambassadors to lesser races.

Amiable and flighty, brass dragons make friends and allies quickly and easily, not because they are particularly charismatic, but because they are the dragons most likely to interact with humans and other lesser races. Their associates help brass dragons fulfill their twin aspirations of gaining as much knowledge as they can while doing as little as possible. More so than any of the other metallics, brass dragons are lazy.

Like all dragons, brasses enjoy indulging themselves in their favorite pastimes and vices. Thanks to the oppressive heat and aridity of their favored homelands, brass dragons love to sleep and eat. Among the metallics, brass dragons are among the most lean of their sept, due to a scarcity of food near their chosen homes. Only the active blues, who compete with brasses for their desert territories, are more often thin and lithe.

Even the most active brass dragons rarely interact directly with their surroundings. They prefer to trade within their large networks for food, water, and valuables

rather than to go out and seek such commodities themselves. This reliance on others means brasses tend to only alter the geologic, organic, or sociopolitical landscapes around their homes in order to halt the spread of desertification and to provide water for those who have none. A few ambitious brass dragons act as advisors and aides on Manaket's massive desert-halting terraforming project in Rahadom.

Brass dragons hoard knowledge, both written and oral, and are prodigious readers. Unfortunately, their ability to retain information is weakest among the metallic dragons, which combines poorly with their propensity to exaggerate facts for the sake of better stories. Together, these traits make brass dragons unreliable fonts of knowledge, news, and information. That said, brass dragon hoards sometimes contain more books, scrolls, and engraved tablets than many human libraries—and unlike every other aspect of their being, brass dragons are obsessive about keeping their personal libraries organized and well-cared for.

Sappy, sentimental, and emotional, brass dragons openly express their deepest feelings with earnest zeal and unbridled passion. They cry when they need to cry, laugh when they need to laugh, and fly into fierce but mercifully short-lived rages when moved to anger. Brass dragons seldom stifle their emotional outbursts, and they loudly proclaim their state of mind without shame or dignity. Easily moved by tearful tales of woe, brass dragons respond more favorably toward ill-conceived but emotionally evocative arguments than to carefully reasoned appeals to logic and sensibility.

Such mutability often manifests in the magic they favor. Either as result of millennia of selective breeding or as divine irony meant to exacerbate their ever-changing ways, brass dragons typically favor magics that alter the world around them, particularly from the school of transmutation. They particularly enjoy spells that allow them to mold and shape materials, although they also frequently take up transmutation magic that alters themselves in some favorable way.

Living in deserts, brass dragons learn to dine on scarce, simple fare that is full of flavor. Along the western and southern reaches of the deserts covering

Rahadoun, where the endless sand and lifeless rocks give way to living deserts rich with cacti, rodents, and small predators, brass dragons feast upon cactus blooms, coyotes, rattlesnakes, and desert eagles. In the more inhospitable deserts that cover Thuvia, Osirion, and Qadira, they make do with what they can trade with passing caravans or the occasional desert bloom they uncover. They favor hot spices, particularly those from Qadira and distant Vudra, and they find the typical foods of Avistan bland and nigh unpalatable.

Brass dragons are generally considered the diplomats and heralds of dragons, but despite their long record of service to the draconic father-god Apsu in this regard, they do not consider themselves overly religious. Few brass dragons devote themselves to Apsu, much less the deities of lesser races, but most willingly serve their immortal father-god whenever he calls.

Although much is written about the ever-changing interests and desires of brass dragons, of their mercurial and carefree personalities given to whim and flights of fancy, in one respect alone are brass dragons almost completely immutable. Second only to the nigh-immutable golds, brass dragons are the least likely to tarnish and slip into the uncaring malaise of neutrality or—more pitiable still—the cruel selfishness of evil. Because of their strong resistance to tarnishing, those brass dragons who do fall from grace almost always lose their sanity in the process. Their minds simply shatter with the weight of tarnishing, and only the most powerful of magics and long years of rehabilitation can bring these poor wrecks back to a semblance of the glory they once possessed.

HOARD AND HOME

When brass dragons have their way, they set up their lairs within sand-scoured caves and alcoves near or beneath ground level within rocky up-thrusts—the larger the cave complex, the better. Unusually patient brass dragons sometimes use their inherent mastery of wind and weather to scour the walls of their lairs, slowly enlarging them. The lairs of these dragons are spectacles of windblown sandstone. Strangely, despite their love of wide-open deserts and expansive cave networks, brass dragons like the entrances to their lairs as narrow as possible, going so far as to partially collapse overly large entries to make them tighter. Of course, because brases rarely plan ahead, they must periodically widen the entries to their lairs to make room for their ever-growing bodies.

Thanks to their love of transmutation magic, their long lives, and their sense of aesthetics, brass dragons spend more effort and time beautifying their lairs than setting up defenses. Brass dragons remain inherently lazy and easily bored, however, so their lairs frequently contain numerous abandoned beautification projects.

The defenses that do exist in their lairs are haphazard at best, and rarely reflect any sort of coordinated effort or stratagem. Because of this, dragon hunters and scholars find brass dragon lairs the easiest to enter. Brass dragons enjoy friendly company more than any other dragon types, however, and many claim their lack of defensiveness to be a part of that personality trait.

Some brass dragons invite other creatures to act as the guardians of their lairs. More often, though, the dragons invite others to come stay and talk with them. Over time, those long-term guests become de facto guardians of the dragons and their hoards when even the mightily talkative brases grow tired and must sleep. How long these guardians stay and their loyalty to their brass dragon hosts vary considerably, although most willingly risk injury (rarely death) in order to protect their draconic friend and patron. Creatures most often encountered half-heartedly defending brass dragon lairs include nomadic humans, riddling sphinxes, loyal djinn, and oft-drunken bralani.

Partially because of their own mercurial nature and partially because more powerful blues occasionally drive them from their half-completed homes, brass dragons are the most mobile and nomadic of all true dragons. Most brass dragons rarely live in one lair for more than a couple dozen years, and particularly long-lived brases sometimes live in the same location two or three times in their lives, with their habitations separated by hundreds of years.

A large and growing minority of brass dragons eschew traditional lairs and consider anywhere they lay their heads as their home. These anthrodraconi (singular anthrodraco) live among humans and other lesser species, and act much like their shorter-lived mortal neighbors. Although they rarely take on actual jobs, brass dragon anthrodraconi are apt to contribute to their communities in other ways. Some become advisors, diplomats, or heralds for the human rulers under whom they live, while others take a more active role in their communities as town guards, military leaders, or information brokers. A few—and unfortunately for brass dragons as a whole, the best-known—become town drunks and rabble-rousers, pouring their vast hoards into taverns and inns. These minor celebrities can attract spectators to their favorite watering holes, bringing in even more outside wealth and increasing the dragon's popularity in the city.

Among the least pragmatic of all dragon breeds, brass dragon sentimentality is strongly reflected in their hoards. Such collections are mixtures of vast counts of coins and other mind-boggling treasures, stacks of well-read books, shelves of scrolls, and scores of worthless items the soft-hearted brases consider priceless heirlooms.

Because of their relatively mobile natures, brass dragons favor magic containers that hold more than their size would indicate. For this reason, brass dragons occasionally make

ill-advised trades of far-more-powerful items for *bags of holding*, *handy haversacks*, *portable holes*, and the like. These items allow the brasses to carry their hoards with them, which only encourages their semi-nomadic ways.

Thanks to their arid, often lifeless homes and hunting grounds, brass dragons also favor living, growing things. Many grow (or fail at attempting to grow) small plants or keep tiny animals as pets. Their best successes in these endeavors occur, not surprisingly, when they attempt to grow cacti. They also favor items made from organic materials, particularly woodcarvings, paper prints, books, and paintings made on canvas or wood blocks. Most of these items fall under the category of worthless but sentimentally important.

A typical brass dragon's hoard consists of coins and art objects (usually about two-fifths of the hoard's overall worth); dozens of nonmagical scrolls and books, generally notes about important people or guidebooks to the nations in which they live (roughly a quarter of the total worth); various magic items, including books, scrolls, and magical carrying devices (another quarter); and hundreds or thousands of various trinkets, knick-knacks, souvenirs, sticks, shiny rocks, pretty feathers, and other items of limited or no monetary or aesthetic value.

CAMPAIGN ROLE

Brass dragons make for among the most varied of draconic breeds in terms of use in a campaign. They can serve as comedic relief, although they should not be played as incompetent buffoons—rather, they should be presented as useful contacts with one or two humorous traits. On the other hand, an incredibly rare tarnished brass can make for a pitiable and unexpected foe.

Brass dragons excel as patrons for characters of all levels. Their extensive networks of contacts allow them to enlist the aid of up-and-coming adventurers through proxies. As their pet projects gain in power, the brasses can manipulate events to bring the characters within ever-tightening circles of more trusted and powerful advisors until the dragons and their adventurous clients finally meet in person. Of course, some brasses prefer to never meet such groups of freelance adventurers in person.

As might be expected, many brass dragons cannot muster the attention span or intellect to set up and maintain such elaborate chains of servants, and their networks of contacts are little more than scores of beings they can invite to parties and feasts. In these cases, brass dragons still make excellent patrons, but their involvement becomes more direct and completely unsubtle.

ON GOLARION

Brass dragons enjoy the heat of the Garundi and Casmir deserts, particularly those of Osirion, Qadira, and Thuvia.

Prior to its infernal conversion, southwestern Cheliax housed a large number of brass dragons, particularly in the province of Kharijite. With the rise to power of House Thrune, the brass dragons—many of whom fought against Thrune and its allies during the decades of civil war—wisely fled to Thuvia, Osirion, and Qadira, leading to conflicts with blue dragons already carefully emplaced within those areas. Other brass dragons fled east into southern Andoran and Taldor, but for reasons none mention, the breed seems to avoid Absalom and its holdings.

As mentioned earlier, an extensive population of scattered brass dragons lives in Thuvia, which possesses the largest collection of them on Golarion. Thuvian brasses tend to work for certain Water Lords who have proven their virtue and struggle against those who haven't. Those brass dragons with pools in their lairs allow the Water Lords nearly unlimited access to their water in exchange for trustworthy guards to watch over both the water and their homes. Many of these guards become members of the dragons' vast networks.

Just outside of the city of Manaket in Rahadoum, an enormous public works project has the lofty goal of pushing back the desert and bringing life to the surrounding area. A half-dozen brass dragons openly support this project, although their tendency to avoid one another means all but one of them simply provide advice (via proxy) and money to the project. The only brass dragon who directly aids the effort in more direct ways is Sarithil, the eldest of the six. Despite their desires to avoid each other, on at least three occasions several of the brass dragons took to the air to personally defend the project and its workers from rampaging desert monsters or human raiders.

NAMES

Brass dragons favor names relatively easy for humanoids to pronounce. As far as draconic names go, brass names are typically simple and short. Like all dragons, they make extensive use of the sounds represented by the Common letters "k" and "i," although they tend to avoid the compounds "ik" and "zil," with the notable exception of clan Listrizil, whose members indulge in the usual amount of draconic complexity. Brass dragon names seldom begin with vowels.

Brass Dragon Names: Jakthil, Rixatim, Warthalan

SARITHIL

With her water-storing lair less than 4 miles from Manaket, Sarithil was the first brass dragon to lend her aid to the reclamation project. She contributes her time, knowledge, and gold to what she considers the most worthy project ever performed by humankind.

Although a mature adult, Sarithil is still inclined toward the gregarious indulgence commonly found in

younger members of the breed. Whenever the project achieves a milestone, a section of the works is completed, or the calendar simply rolls over to a new month, Sarithil supplies wine and (her personal favorite) goat cheeses in great parties that can last into the early morning hours and without fail result in the hostess passing out in a wine-soaked stupor. Although Sarithil claims to hold these parties to celebrate, the other brasses know she also partially hosts them to forget her past.

Sarithil began her life in Cheliix, long before the death of Aroden and the once-fabulous empire's fall into infernal tyranny. She joined one of the now-extinct noble houses that fought against House Thrune and continued her fight until only she and one human noble of that house survived. Although Tyraxylan attempted to recruit Sarithil to aid in the resistance movement, the brass had her fill of war and fled into Kharijite, then through Rahadoum and into Thuvia. Sarithil has lived in Thuvia for the past 70 years, and her current lair is the second she has claimed since moving into that country (her first was larger, but lacked water).

A vast web of contacts, allies, and friends—including two other brass dragons she subtly influences—spreads across Thuvia and into Osirion, Rahadoum, Qadira, and even Absalom. At the center of this network sits Sarithil, who only began to acquire contacts haphazardly and mostly by accident, but who, over time, grew to understand their importance. Although she rarely actively works to maintain her vast network, it nonetheless holds together thanks mostly to her close friend, the djinni known as Al-Akzaan. Sarithil's network helps her in her pet projects (predominately the public works project in Manaket) and keeps her informed of the doings in Thuvia and Cheliix.

TACTICS

Before Combat Sarithil hates conflict and attempts to defuse tense situations before they erupt into battle. If she cannot, she attempts to cast the following spells on herself, in order, before combat ensues: *haste, bear's endurance, blink, bull's strength, gaseous form*.

During Combat If alone and not in her lair, Sarithil tries to flee combat. If prevented from doing so, she uses *suggestion* and *reduce person* to disable her foes. When backed into a corner, she alternates using her breath weapon with full attacks, casting an occasional *magic missile* if it seems prudent.

Morale Sarithil abhors combat and only fights if absolutely pressed, but when defending something she cares about, she fights to the death.

Bronze Dragons

You can trust a bronze dragon with your secrets, your gold, your dearest treasures. A bronze would rather die than betray that trust. You can trust he will not try to take these things from you, and you can even trust him to guard them for you in your absence—and to give it back to you upon your return. This unerring desire to protect and steward makes bronze dragons uniquely suited to the roles of guardians, bodyguards, and keepers of knowledge. Much of the history we know of our world exists thanks to the bronze love of lost lore.

—*Drakanav Codex*, Chapter 14

Contemplative, thoughtful, and curious, bronze dragons make for natural scholars, seers, and sages. They seek all chances to learn, to expand their intellectual horizons and satisfy their strongly inquisitive natures. While silver and gold dragons possess greater raw mental power, bronzes are the great thinkers of metallic dragons. Bronze dragons excel as numerologists, astrologers, researchers, sages, and scribes, as well as in all other contemplative roles suited to their calm, meticulous, and endlessly patient natures. It was a bronze dragon—Svannost, according to the Obelisks of Destiny—who first put claw to clay and recorded what was, to him, recent history: the retreat of Apsu and his metallic children from their chromatic kin and the nameless world turned to slag by their war.

In that first great battle against the chromatic threat and in the countless thousands of millennia since, bronze dragons protected their kin and stood as living shields against relentless, rending claws, for although calm and thoughtful, bronze dragons are neither meek

nor feeble. While many bronzes play out their long lives collecting immense libraries, many others spend their centuries of life guarding living treasures and protecting those they hold dear. Bronze dragons make exceptional guardians, protectors, and bodyguards, willing to spend vast gulfs of time simply waiting, watching, and—when the mood strikes them and assuming they have the proper accoutrements—reading.

Bronze dragons lack the massive racks of horns and bony protrusions of their brass and copper cousins, possessing instead sleek heads and bodies bearing membranous frills that belie their amphibious natures. These frills serve a dual purpose: on land, they help cool the dragons by circulating blood through their thin membranes, while in the water they help protect the bronzes' delicate and primitive gills. Membranes do not end at their heads, and the majority of bronze dragon bloodlines possess webbed toes, flaps of skin at the crooks of their forelimbs, and paddle-like fins along the ends of their tails they can use as rudders in water and that fold flat on land. Bronze dragons have the smallest wing-to-body ratio of any true dragons, forcing them to exert themselves more than their kin in order to fly.

ECOLOGY AND SOCIETY

Physically powerful yet precise and careful in their movements, bronze dragons exceed in strength what they possess in intellect. Their sleek, muscular bodies are perfectly suited for cutting through water, and their many membranes, frills, and flaps of skin help propel them tirelessly through any liquid. Thanks to their relatively small wings, bronze dragons must work harder than other flying creatures to bring themselves airborne, and thus most of them prefer to remain on the ground or in the water.

Below and behind the large fan-like head frills that extend just back from their jaws, bronzes possess a number of wide gills that allow them to breathe water as easily as air. When surfaced, they keep these gills closed with strong muscles, but in the water they use their frills to create small jetties of water that sweep into their gills and provide them with oxygen. Bronze dragons live as comfortably in water as on land, and most attempt to live within a day's flight of some ocean or vast lake. Because most of their prized possessions do not survive well in water, bronze dragons more often remain on land or underground, although they frequently visit large bodies of water in order to harvest fish, clams, crabs, and other seafood—by far their favorite meals.

Because they tend to keep to themselves and—thanks to their hyper-efficient draconic metabolisms—can survive for a year on a single day's haul of fish (which they dry and store for eating after long naps), bronze dragons have minimal effects on their surroundings. They do occasionally emerge from their lairs to gather food, which can temporarily

deplete an area's supply of seaborne creatures and plants, fruits, root tubers, and tree nuts (particularly chestnuts). Herders and ranchers never fear the proximity of reclusive bronzes, as they do not enjoy and only reluctantly consume the meat of land and air animals.

Bronze dragons do not quickly acquire friends, but those they do make gain loyal—if somewhat aloof—allies and companions. Most bronzes keep to themselves, preferring the quiet solitude of vast libraries and isolated forest clearings. They are the least social of all metallic dragons, and many disappear for years or decades at a time before suddenly returning to favorite booksellers or libraries in order to acquire more reading material. Some bronzes combine their vast intellects with their voracious reading habits and write epic-length treatises on some minutiae or another.

The bronzes' patience and curiosity make them natural mathematicians. Although bronze dragons try to take credit for all sorts of mathematical inventions, documentation laid down by their own ancestors tends to counter their claims. What the legitimate histories of dragons do record, however, are great contributions to advanced mathematics by the bronze numerologists.

Thanks to bronzes' patient natures and comfort with passing time idly, many creatures (including the other metallic dragon kinds) beg, petition, coerce, or hire bronze dragons to act as guardians. Those wise enough to learn about bronzes before petitioning them know to offer up interesting books with which the dragons might pass their time, but on occasion bronze dragons take up guardianship out of a sense of goodly duty. These bronzes frequently spend their time in contemplation or meditation, if not outright sleep. Others take on charges to protect interesting locations or people, studying the former in great detail (later writing exhaustive and exhausting guides to these places) and observing the latter with sometimes-uncomfortably intense scrutiny (occasionally writing revealing biographies).

Bronze dragons make perfect bodyguards and protectors, as they do not easily give in to jealousy or greed. When tasked with guarding treasures not theirs, they do not wile away the hours contemplating schemes to acquire what they watch; most turn their minds to some other distractions, while others study the objects they guard with precise scrutiny. Even if disinterested in the items they guard, bronze dragons willingly sacrifice anything short of their own lives to protect the objects.

In addition to scholarly and protective pursuits, a rare few bronze dragons seek enlightenment and become ascetics and the draconic equivalents of monks. These contemplatives spend centuries in temples and monasteries, often in human guise, acting as advisors to the monastic leaders (although almost never becoming

leaders themselves), teachers of acolytes, or guardians of the monastery's surroundings. This practice seems more common in Tian Xia and on the island of Jalmeray, but at least two monasteries on Avistan house bronze dragons: the Vythded Monastery in Lastwall and the Palace of Virtue in Molthune.

Ever curious and hungry for knowledge, bronze dragons frequently excel as diviners, soothsayers, seers, and fortune-tellers. They favor divination magic over all other schools, a fact that lends well to their successes as guardians and bodyguards. Although bronze dragon lairs rarely possess many magical or physical defenses, the protections that do exist prove very effective against intruders, thanks largely to the watchful nature of the dragons themselves.

HOARD AND HOME

Bronze dragons prefer to live in hilly lands with temperate, mild climates. They enjoy both warm, sunny days and cool, rainy ones, but they hate snow, strong storms, wet heat, and other forms of extreme climate and weather. When they do not live among the lesser races in grand libraries

or vast and ancient monasteries, bronze dragons live alone in large, dry caverns. The most common modification bronzes make to their lairs is the addition of vast rows of shelves upon which to store their accumulated libraries.

Bronze dragons only live in places where their actual living chambers remain dry and warm, but they prefer lairs with underground water supplies. Most bronze dragons modify their lairs (often with the help of creatures better suited to the alteration of stone) so the entrance tunnels are fully submerged at some point, and bronzes often judge the lairs of their brethren by how much of the entrance tunnels are flooded—if the submerged section extends farther than humans can hold their breath, so much the better. Flooded entrance tunnels containing fish, shellfish, water plants, and other edibles give the bronzes added prestige in the eyes of their kin.

Beyond the flooded entrance tunnels (and there are almost always more than one), a bronze dragon's lair typically contains drying rooms, where the dragon and its guests can lie down and rest while they dry. Some bronzes keep large collections of copper items in these chambers, where they use their lightning breath to flash-heat the metal to aid in drying. Others light bonfires, but only if the chambers are well ventilated. Most, however, simply allow the passage of time to dry them.

Because bronze dragons love both water and things easily destroyed by it, they are careful to keep their two loves strictly separated. Many invest in waterproof containers or extradimensional spaces with which they can

haul new fragile treasures through their flooded entrances. Beyond their drying rooms, bronze dragon lairs are always completely dry and warm. Many contain vast chambers lined with bookshelves of some manner. Most of these rooms are kept dry with rocks heated elsewhere in the lair and brought into the libraries, or large strands of copper cable warmed with electric dragonbreath.

Bronze dragons rarely keep guardian creatures, although they certainly welcome the company of like-minded creatures of high intellect and some ability to aid in the defense of their libraries. For this reason, the lairs of old and powerful bronze dragons occasionally double as the homes of powerful

human or elven wizards. While most of these wizards are diviners, bronzes welcome any goodly wizards who act respectfully and politely toward their draconic hosts.

No creature larger or more threatening than a snail enters a bronze dragon's lair without its knowledge, and when intelligent invaders push their way into its home, the dragon monitors and studies them intently for a few minutes. Once it has acquired as much information as it thinks it needs, it launches its swift and deadly counterattack. Bronze dragons like to keep a number of divination spells active within their lairs at all times, and most have several others handy with which they can glean information about potential threats.

A few wealthier bronze dragons create more active defenses, embedding thick copper wires or cables in the walls of their lairs. These wires form vast conducting loops that pass through submerged tunnels and other sections of standing water. Bronzes with these kinds of defenses in their lairs use their lightning breath, electrifying these conductors and shocking those who dare to invade their homes.

Bronze dragons who live more socially, dwelling among humans and other lesser races, call libraries, temples, and monasteries their homes. These places typically cannot house the dragons' impressive natural bodies, so most must live as humans within these places. Of course, their true natures usually become known, and legends grow up around them and the places they call home. These legends alone are often enough to forestall intruders into their homes, but occasionally the tales of their existence actually draw evil dragon-hunters.

Even more so than brass dragons, bronzes crave knowledge, usually for the sake of simply knowing. They rarely use their knowledge for anything other than the most academic and scholarly of pursuits, although many study areas of knowledge that prove useful in a practical sense (such as magical theory or alchemy). Bronze dragons by and large know a great deal of the world as it once was, and generally have little interest in the world as it currently exists. Thus, seekers of knowledge do best to contact brass or gold dragons when they need modern information (such as secrets regarding a kingdom's current ruler) and bronze dragons when researching history (such as the lost tomb of that kingdom's first ruler).

Bronze dragon hoards contain vast libraries of books, scrolls, and other recorded material, most of which focuses on a single topic. Bronze dragons who are more interested in pursuits that require additional materials (such as alchemy or magic item creation) also hoard those supplies. A bronze studying alchemy, for example, might own four or five complete or partial alchemy labs, while one more interested in numerology might keep several dozen abacuses on hand.

BRONZE BRYEMIRITES

When Bryemir, a dragon of an unknown kind, appeared roughly 2,000 years ago and proclaimed that only by calculating the so-called perfect number could dragons forestall some terrible but unnamed fate, draconic numerologists across the world took note. Since then, a small number of extremists, derisively dubbed Bryemirites by critics, have dedicated their lives to pursuing various equations to arrive at the perfect number. Most Bryemirites are bronzes who work (sometimes begrudgingly) with a large minority of greens. Thanks to their efforts, many bronze dragon numerologists obsessed with finding the perfect number have contributed extensively to the advancement of numerology and mathematics.

While proponents point to the successes of these supremely accomplished mathematicians and numerologists, detractors loudly wonder how much more the Bryemirites could create, discover, or do, were they not distracted by folly. Thanks to the relentless passage of time and the draconic obsession with power, interest in Bryemir and the perfect number increases with each passing century, such that there are more bronze dragons working on discovering the perfect number today than in all of history combined.

Like all dragons, bronzes also love the feel and sound of coins rubbing against their bodies. Their coin beds are typically covered or surrounded by books, scrolls, and stacks of loose papers, but the bronzes are careful to keep the papers from falling onto the actual coins. Although the least tidy of lawful dragons, bronze dragons nonetheless keep a very careful counting of the coins in their hoards and are instinctively aware of the loss of even a single one. Of course, thanks to their untidy natures, bronze dragons frequently lose a few coins, particularly when they sleep for long periods. For this reason, most guests leave their lairs before the dragons fall asleep, lest they be blamed for misplaced coins.

Bronzes also favor beautiful items from nature, particularly those that grow in the sea. Many bronze dragon hoards contain impressive collections of colorful seashells, coral, strangely shaped pieces of driftwood, and rocks with holes carved in them through centuries of tidal action. Their hoards might also contain pressed flowers or colored leaves of past autumns, pinned insects with particularly colorful carapaces, or cut wildflowers in glass vases. On rare occasions, bronze dragons bring beautifully plumaged birds into their lairs, which they allow to flit about at will, although they generally only do this if narrow vents or other fissures allow the birds egress if they so desire it.

For magic, bronze dragons prefer items that allow them to move new additions to their hoards safely into their lairs. They also favor items that aid their own

divination, such as *crystal balls*, or items that aid in their academic pursuits, such as animated quills that dictate whatever the dragons say. Those bronze dragons more interested in protection than scholarship prefer items that magically bolster their ability to avoid or survive attacks. They also like items that heal their wounds when their protections fail.

CAMPAIGN ROLE

Bronze dragons rarely become patrons for lesser beings. They prefer solitude and quiet study to the administration of others. Those few bronzes who do take an interest in other creatures make for inattentive, forgetful, and negligent benefactors. A bronze dragon might elicit the aid of characters once, drop all contact with them at the conclusion of their quest, and then suddenly call upon them again several decades later—only to find, at least in the case of humans and other shorter-lived creatures, that time has diminished its one-time allies.

Rather than assuming the roles of patrons, proactively sending adventurers on quests in order to further the greater good, bronze dragons make better fonts of knowledge that can help point lost characters in the right direction. Unlike brass dragons, though, bronzes do not act as information brokers. They rarely ask anything of significance from those they aid (indeed, usually their only request is for visitors to not touch their books) and gladly share their knowledge. As scholars, academicians, and thinkers, bronze dragons rarely possess information pertaining to the current state of the world around them, but instead prove invaluable as resources with regard to ancient history and arcane subjects. The only true danger visitors face from bronze dragons is their tendency to answer not only the questions posed to them, but a half-dozen other unasked and unnecessary questions as well. Those seeking knowledge from bronze dragons are advised to allow for at least half a day when doing so—and that is only if the question asked is relatively straightforward. As bronze dragons consider it exceedingly rude for guests to interrupt them, attempts to depart early can be met—in the most extreme cases—with suddenly angry hosts.

The more social members of the bronze dragon species become guardians and protectors. Characters might interact with these bronzes as charges to be kept safe, employers hiring the dragons, or opponents who must defeat or otherwise circumvent them. Although bronze dragons do not frequently use their innate shapeshifting ability to take on humanoid forms, only fools ignore rumors of disguised dragons living somewhere. For this reason, meeting a legendary bronze dragon can actually be the goal of a quest or—more likely—the logical information-gathering step during a greater adventure.

ON GOLARION

Bronze dragons live all over Golarion, from the unsettled lands of Varisia to the breathtaking cities of Vudra, the cosmopolitan streets of Absalom to the bamboo forests of Tian Xia. The most significant exceptions to bronze ubiquity are Cheliah and Geb, the former because of its recent fall from grace into infernalism and the latter due to its unholy reliance on undead labors. Other nations of obviously evil bent provide homes to small populations of bronze dragons, often doing their best to stem the tides of evil in those lands, but most bronzes seem to universally shun Cheliah and Geb.

Cheliah's former masters in Taldor can claim a great many bronze dragons—indeed, the decadent nation possesses what many suspect is the largest population of bronzes in the Inner Sea region, if not the entire world. Many speculate that the bronzes enjoy the climate of Taldor or its people, but the truth of the matter lies with Royal Proclamation of the Draconic Banking, made by King Dahelvian in 1941 AR. This proclamation allows bronze dragons to establish banks and charge interest within the four cities of Cassomir, Maheto, Oppara, and Zimar without paying taxes to the crown. Bronze dragons call Taldor the Generous Land, and the descendants of the original bronzes to flock to the four cities continue to live and thrive nearby. Although they pay no taxes on the gold gained through their banking interests, the bronzes continue to inject gold into the local economies, further adding to what many call the self-destructive decadence of Taldor.

At the other end of draconic greed, the Monastery of Shung-Li in the Tian nation of Dtang Ma houses the venerable bronze dragon known as He Fa Chu (though that is not his draconic name). He Fa Chu serves as a guardian of the monastery, as well as a wellspring of wisdom that transcends the short generations of humans. In the 1,500 years that have passed since his arrival at the monastery, Master He Fa Chu has helped repel more than five dozen attacks and attempted thefts, convinced 17 kings to pray at the monastery's temple, trained and counseled thousands of devoted monks, compiled and obsessively organized the largest library in Dtang Ma (some say one of the three largest in Tian Xia), and mediated several disputes—most recently between the local *kami* and a population of nomadic kitsune.

NAMES

Unlike all other metallic and chromatic dragons, bronzes occasionally give their offspring names from languages other than Draconic. Names incorporating Dwarven and Elven words are not unheard of among bronze dragons, although the parents tend to create names that sound pleasing to their ears, even if the names make no sense

in the languages from which they are borrowed. Bronzes consider names in Common to be gauche, unless the words they utilize originated elsewhere (thus, many bronze dragon names that sound like Common are actually meant to be in Dwarven).

Sample Names: Akerlinis, Naprygonor, Svannost, Erthidrix

SPRAVILVOST

Although relatively young for a dragon, the adventurous Spravilvost nonetheless has experienced a great deal of what Avistan has to offer. Joined by his loyal friends Rin the gnomish lady adventurer (i.e., rogue) and the implacable dwarven paladin Sir Lothar, Spravilvost currently lives as a human in Molthune. There, Spravilvost's natural tendency to guard and protect allows him to act as bodyguard for General Lord Liocarcinus.

SPECIAL ABILITIES

Alternate Form (Su) Spravilvost can assume any animal or humanoid form of Medium size or smaller as a standard action three times per day. He can remain in his animal or humanoid form until he chooses to assume a new one or return to his natural form.

Breath Weapon (Su) Spravilvost has two types of breath weapon, a line of lightning and a cone of repulsion gas. Creatures within the cone must succeed on a DC 20 Will save or be compelled to do nothing but move away from him for 1d6+4 rounds. This is a mind-affecting compulsion enchantment effect.

Water Breathing (Ex) Spravilvost can breathe underwater indefinitely and can use his abilities while submerged.

Copper Dragons

Those with a mission of mercy to perform, a tyrant to overthrow, or a wrong to right cannot hope to find a more enthusiastic supporter than a copper dragon—for a time. Possessing remarkably short attention spans, even in comparison to humans, contrasted with boundless energy when concentrating upon a singular task, copper dragons push their allies and companions to wondrous heights of courage and glory before growing bored with the whole mess and returning to the tavern for another drink. Or ten.

—*Drakanav Codex*, Chapter 15

Copper dragons enjoy personal freedom, and many are willing to kill or die to protect their right to choose how and where they live. This love for freedom makes them popular with the republic of Andoran, and the highest concentration of coppers in Avistan lives in that democratic nation. Most coppers, though, choose not to live in the only nation-state that already allows for a great deal of personal freedom, but rather in those places most in need of freedom fighters—a role many relish.

Idealistic but easily distracted and even more easily bored, copper dragons make for intense but short-lived allies. Those in search of aid from a copper dragon can muster more and better support if their tasks can be completed relatively quickly. No such quest should last more than a couple weeks, and any endeavors taking more than a few days run the risk of losing the coppers' interest. Draconic scholars can relate with knowing smiles numerous tales of lofty quests enjoined by copper dragons at the outset, only to have the draconic heroes depart on the eve of the (usually thereafter doomed) climax. Coppers

also make decent intermediaries between more powerful dragons and human allies, although once again their reliability can quickly become an issue. A message too difficult to deliver can easily be erased from a copper's mind in a celebration of wine, beer, and stronger spirits.

Coppers possess the largest number of head horns among the metallic dragon breeds. The magnificent crowns of horns that they bear grow up out of thick bony plates that form the backs of their skulls. These solid collections of horns can weigh hundreds of pounds on the largest copper dragons, and as a result the breed tends to have relatively short but thick necks. Aside from that very iconic head feature, copper dragon appearance varies widely, although the breed is the most likely of the metallics to be snaggletoothed.

ECOLOGY AND SOCIETY

Coppers exhibit their love of personal freedom via a penchant for extreme hedonism. Although fantastically long-lived by human standards, copper dragons rarely plan for their millennial futures, spending their hoards on frivolities and easily making friends among the shorter-lived races who they both forget and outlive. Those who consider copper dragons their enemies are sometimes surprised to find that their erstwhile foes do not share such opinions. Copper dragons are remarkably forgiving of all creatures, even their chromatic cousins, and do not hold grudges. Indeed, copper dragons would make excellent diplomats and judges, thanks to their desire to see situations from multiple perspectives, but their excitable and undisciplined natures prevent them from being effective in those roles.

Instead, copper dragons are the freedom fighters of dragons, working alone or in small groups to break the chains of oppression—either literal, physical chains holding the unjustly imprisoned or else the figurative, metaphysical chains of oppression and tyranny. Copper dragons become the greatest champions of whatever causes stir their imaginations and rally them to battle, and frequently ally with worshipers of Cayden Cailean due to their shared passions. Like shooting stars, though, the zeal of copper dragons shines brightly for a brief time before quickly burning away. On the other hand, coppers are easily manipulated into renewed vigor by presenting them with previously championed situations they have since lost interest in and portraying them as new but similar circumstances. In this way, wise humans allied with coppers can bring their draconic friends back into long-term struggles by suggesting unique positions on the situations at hand.

Copper dragons bore easily and are easily convinced of one argument over another—sometimes changing their minds on a particular topic every time they speak

with someone invested in it. Of all metallics, they are the most likely to tarnish into neutrality (though they never lose their chaotic love of change and freedom) and the most likely to rampage, usually after they tarnish but often because a smooth tongue or fair-faced elven maiden convinced them that doing so would gain them or their cause some sort of advantage.

When they err, and later realize what their poor decisions have wrought, copper dragons are genuinely remorseful and prone to sink into depressed lethargy for several weeks or exhibit a manic enthusiasm to undo their destruction (usually lasting until the job is completed or for several months, depending on the situation). As a result of this particular proclivity, most of the other good dragons try to remain politely aloof from their copper kin. This tendency to lash out makes them the only metallic breed not universally hated by the chromatic dragons, who sometimes achieve remarkable success at coercing coppers, or at least playing upon their mercurial emotions. Because of their own destructive and weak-willed tendencies, copper dragons remain endlessly forgiving of the foibles and vices of other creatures, especially other copper dragons but also including the chromatics.

Thanks to their tendencies to launch into unprovoked rages, scholars consider copper dragons the most dangerous and unpredictable of the metallic dragons. Others call this assessment partially unfair: while brass dragons are unpredictable, coppers simply enjoy the freedom to do as they will. No one debates their danger to lesser races, though. Not counting tarnished metallics, copper dragons exhibit the greatest tendency to attack lesser races without discernible provocation.

Copper dragons defend themselves from these accusations by noting that they never attack creatures unprovoked. They justify their actions by turning around the accusations and claiming that the beings deserved the attacks for some reason. The reasons given typically include attempts by the attacked creatures to limit some other creature's freedom in some way (telling a copper it is not allowed to do something is a grave offense), attacks against the dragons (either against themselves personally or against their beliefs), or insults against the dragons or their hoards (these slights might be intentional or not, and some are completely in the heads of the coppers). What many coppers and scholars point out as well is that these attacks rarely result in fatalities for those attacked. Unwise scholars sometimes compare the attacks to otherwise passive dogs snapping at annoyances, but copper dragons dislike the comparison and may attack those who make it.

Copper dragons enjoy dry, warm climates that do not truly count as deserts. Their preferred homes are dry pine forests in the arid foothills of tall mountains, although they (sometimes begrudgingly) live wherever their latest

interests take them. Even more transitory than their brass kin, copper dragons rarely hold their lairs for more than a few years before moving on.

For the most part, copper dragons cause little more impact on their surroundings than any other large omnivores, although a single adult copper dragon can consume as much food as several bears. Only when a copper dragon goes to a place in order to right some perceived ecological wrong (usually at the behest of a druid, elf, or other creature intimately connected with the natural order) does it actively engage in changing its surroundings. Otherwise, copper dragons live by the philosophy of “live and let live,” and are the dragons most likely to adopt herbivorous diets. Alone among all true dragon breeds, copper dragons adore sweet foods. When living in or near towns, copper dragons frequent bakeries, while those living away from civilization favor berries, juice-rich fruits, honey, and sugarcane stalks.

Many copper dragons attempt to alleviate their boredom with magic, and nearly all copper dragons learn or manifest some kind of illusion magic. They use this power both to entertain themselves and in more useful pursuits when engaged in their latest championed causes. Of course, many copper dragons are tricksters and pranksters, and their mastery of illusions only aids them in the performance of mischief.

HOARD AND HOME

Copper dragons like to live in caves that open out of the sides of sheer cliffs, but when such geologic features are unavailable they turn to whatever dry caves they can find. Perhaps the only condition for a lair universally set by coppers is the uncompromising need for an absolutely dry home. Coppers feel this point so strongly that they even use their fiery breaths to evaporate standing pools or their rock-shaping abilities to plug water moving into or through their new homes, from mere trickles to underground streams. When plugged waterways burst their seams and flood, the copper dragons hastily move on, pretending (if any witnesses are present) that they had nothing to do with the suddenly rushing water.

Despite their love of warm, dry places, copper dragons love freedom even more, and they are willing to live in nearly any environment (though they complain bitterly if forced to endure cold climates) if the chance for freeing other beings from real or political shackles presents itself. Not coincidentally, though, the more unpleasant the environment, the more quickly coppers seem to grow bored by prolonged battles or a perceived lack of success. That said, if given dry, warm places to sleep, coppers willingly stay in otherwise unpleasant conditions for as long as they are needed—at least until they legitimately grow restless.

In these situations, copper dragons rely on their shorter-lived friends and comrades to provide them with some form of comfortable living space. In the Lands of the Linnorm Kings, for example, a number of copper dragons live on the eastern outskirts of Trollheim, where they once patrolled in order to repel ice trolls and protect Irrisen. Today, the coppers live as tolerated guests of Freyr Darkwine, who houses them within massive longhouses kept constantly warm with large fires. This is an extreme example, however, and most coppers refuse to live farther north than Nirmathas, Kyonin, or Galt. Coppers prefer the company of dwarves over elves or humans, as the stout folk tend to create large underground complexes that are both warm and dry. Several dwarven Sky Citadels, including Highhelm, intermittently house one or two copper dragons. The coppers find warmth and safety in these dwarven cities and repay their hosts by exploring places fatal to dwarves (such as areas of molten magma).

When laired in their more traditional homes inside arid caves, copper dragons rely on trickery, subterfuge, and illusions to keep themselves and their relatively modest hoards safe from interlopers. Many create pit traps that they then conceal with both magical and mundane coverings, while more creative coppers hide their pits with mundane means and place illusions across solid flooring—thus luring those who can see magical auras into probing the incorrect sections of ground. Other illusions frequently used by copper dragons include false walls, faux treasures, and shadowy traps more imaginary than real. Coppers of at least adult age use their inherent magical control over stone to seal doorways and passages, often leaving narrow gaps just large enough for would-be thieves to catch tantalizing glimpses of hoards just beyond their reach.

Copper dragons rarely employ guardians unless they reside among the shorter-lived races. Draconic scholars versed in their ways sometimes say coppers refuse guardians because they see guardianship as a form of indentured imprisonment that reduces the freedom of both the guardian (who must stand idly by and protect some item or collection of inanimate objects) and the employer (who must periodically return to pay the guardian for his service).

Because they move around so often and prefer expending wealth to hoarding it, copper dragons gravitate toward small treasures they can easily carry or hastily consume. Gems and jewelry are common, but they just as gladly acquire rare bottles of wine, aged cheeses, imported chocolates, or other expensive or rare consumables they can use to impress guests. Guests can guess the relative length of time a copper dragon has lived in a particular lair by its accumulations. While a lair the copper has only just settled in seems to contain no treasures at all (all of

which the dragon keeps on its own body), a lair housing the same copper for more than a few years contains dozens of bottles of wine and other spirits, hundreds of pounds of dried foods, and stacks of coins (they keep their gems and jewelry with them even after years of relative stability).

Copper dragons love wine more than any other treasure. As mentioned earlier, they alone among dragons crave sweetness, and so favor wines made with the heavy inclusion of various fruits. They therefore prefer elven wines, which they procure at great expense and effort (including going so far as to hire freelance adventurers for such missions). Attempts to possess a particularly excellent vintage of elven wine can cause a copper dragon to forsake his goodly ways, at least temporarily, and indulge in theft, brigandry, or treachery to acquire it. The tale of Thelaxyl and Dyr, often told in lands hosting several copper dragons, warns of such dangers, with dragons battling each other for the prizes. Perhaps because of the tale or simply because it is one of the finest wines ever made (according to copper dragons, most of whom have never tasted it), a bottle of Kasselariel 4130 remains the ultimate prize for a copper dragon's hoard. Thanks to the drive of coppers to own it, a bottle of the wine is worth thousands of gold coins. As of this writing, only 13 bottles are known to exist in the world, down from 14 bottles a year ago, owing to a debauched and riotous party put on by the copper dragon Merksistil with no less than a half-dozen other copper dragons in attendance as witnesses.

Next to wine, coppers love other forms of alcohol (although they are apt to turn up their noses at distilled spirits), fresh sweet foods (such as baked goods and berries), and all the traditional forms of treasure for which dragons are known. Copper dragons care little for items they cannot themselves use or easily trade, and thanks to their tendency to emit great goutts of fire during their drunken stupors, they often sell or trade away books, scrolls, and other easily combustible goods.

CAMPAIGN ROLE

As with all metallic dragons, coppers make good mentors, patrons, or employers for adventurers. Copper dragons tend to be up-front about their true identities and rarely use intermediaries. They speak plainly to those they hire or guide and rarely withhold the rationale behind a particular quest, happily declaring upon questioning what they hope to gain both in the short term and in the future. Many of the assignments copper dragons hand out deal with freedom—physical or political.

A copper dragon can also act as a matchmaker of sorts, bringing together a wide variety of like-minded and sociable beings of various abilities and powers and

providing them copious amounts of alcohol. In this setting, business deals close, quests begin, romances flourish, and friendships are forged. An invitation to a copper dragon's wine-fueled party is seen by many as an opportunity not to be taken lightly, and for this reason alone coppers hold a reputation for being able to introduce important people to powerful individuals who can perform any task, no matter how difficult. How much of that reputation the coppers actually deserve—as they rarely make introductions at their own parties—remains a matter of debate. Most coppers use their reputation to further their own interests, of course, and few resist the urge to mention it when inviting guests.

Those fighting for a worthy cause, such as the freedom-loving Eagle Knights of Andoran and the crusaders of Mendev and Lastwall, can generally expect to receive some aid from copper dragons, even if only in the form of arms, equipment, and coins. Most long-standing wars in Avistan and Garund involve copper dragons to some degree, fighting on the side of goodness or—in the case of wars similar to that between Nirmathas and Molthune, where nobody

is right or wrong—whichever side appeals best to their revolutionary sensibilities.

Among the easiest of metallics to tarnish, copper dragons are the most likely of their goodly brethren to slip into neutrality—either from lethargy or in an attempt to reach compromise or arbitration between two parties. A large number of good dragons who turn to evil are coppers, much to the chagrin of their untarnished kin. Only the lofty but troubled silvers give in to dark thoughts more often. Even those coppers who remain good continue to live in the moment, and thus, regardless of their alignments, coppers remain the metallic kind most likely to battle against creatures who should be their allies.

Most rampaging metallic dragons bear coppers scales. The majority of rampaging coppers lash out only when their frustrated attempts at overcoming some tyrant grow too numerous (how many times a copper can fail in a task before rampaging varies by the individual). Many scholars believe some deep-seated flaw in the way coppers think tells them that destroying an entire town—innocents and all—is somehow preferable to allowing it to continue under the sway of an oppressive power. A rampaging copper dragon can present an unusual challenge for good-aligned PCs: how to stop a supposedly good creature from killing innocents without simply slaying the dragon? Few copper dragons tarnish irrevocably, after all, and attempts to redeem those coppers who fall under the sway of temptation and sin are liable to prove quite successful.

ON GOLARION

With the rise of infernal power in Cheliah, coppers dragons found themselves with a new rallying cry: “Free Cheliah!” In droves they flocked into the empire, only to be repulsed, slaughtered, and driven back by the powerful denizens of Hell serving there. Licking their wounds, the coppers fled from the Chelish heartland into Andoran, where they helped their like-minded human friends break away from House Thrune’s rulership.

As a result, Andoran became the rallying point for copper dragons from across Avistan to show their support for freedom and their resistance to devil-blighted Cheliah. The initial rush of copper dragons nearly broke the Andoran economy and threatened ecosystems throughout the republic, which led the coppers to spread out across southwestern Avistan and into northwestern Garund. Large populations live in every nation bordering Cheliah, including Isgar, where a number of copper dragons attempt to dislodge the Cheliah-loyal government in a proxy war against Egorian itself.

Farther east, the rebellious nation of Galt draws copper dragons, albeit with decreasing frequency. When Galt

first declared its independence, a dozen coppers quickly established themselves in the territory in order to aid in the resulting struggle against infernal Cheliah. Once the country succeeded in its secession, most of the original 12 left in pursuit of other interests. Of the four who remained, one lost his life in the first round of political cleansing and the other three went into hiding. Rumors of their continued but hidden involvement continues to this day in Galt and the neighboring lands, but the trio of Galtan coppers has not been seen in nearly 80 years.

Famous throughout Andoran for his frivolous spending habits, ribald humor, and well-documented cowardice, the young copper dragon Wataxshyl remains arguably the city of Olfden’s main attraction. Whenever Daralathylx visits his wrath upon Olfden, Wataxshyl historically hides away in a local inn and helps the townfolk pay whatever coins or treasures the king demands. This copper’s appearance helped push the balance in the town’s favor during a werewolf raid 50 years ago, and the townsfolk were so pleased they failed to inquire as to why he suddenly appeared. With the passing of years, though, some citizens of Olfden are beginning to question why the drunkard dragon mysteriously appeared and why he seems uninterested in leaving.

History records the great deeds of a handful of copper dragons, including those of the legendary friends-turned-rivals Thelaxyl and Dyr. Many stories also surround Merithyl, a tireless opponent of Taldan slave barons several millennia ago, who infamously drowned herself and an entire ship full of slaves and their slavers when the latter grievously wounded and captured her. One of the most notorious coppers of history is not known for her freedom-fighting or debating over spilt wine, though. Ekishil, among the largest and most powerful coppers ever seen on Golarion, was tempted by dark whispers late in life and eventually succumbed. Over the course of the next 300 years, more than three dozen metallic dragons of various kinds hunted, cornered, or ambushed her at various times, and most died. As a new band of draconic heroes banded together to bring her down, though, Ekishil inexplicably vanished from her hunting ground. Some speculate another band of dragon hunters reached her first, but most draconic scholars deny this possibility. The most compelling theories argue that Ekishil either went into deep hibernation and yet lives somewhere deep beneath the planet’s surface or that she left Golarion and traveled into the spheres, where she plots her triumphant and terrible revenge.

NAMES

Copper dragons prefer names that are easy to pronounce. In general, these names lack the long-winded, tongue-

twisting grandeur of the reds and golds, as coppers prefer to expend their energies in pursuits other than creating convoluted names.

Copper dragon names: Apothyl, Delaxyn, Ith, Motlintil, Shiksinil, Yixel.

TYRAXALAN

When Cheliox fell to the House of Thrune and its infernal allies, copper dragons flocked to the nation from across the globe in a failed and costly attempt to undo Thrune's success. Nearly a dozen copper dragons gave their lives in the month following House Thrune's victory before the rest withdrew and fled into Andoran, Rahadoum, and even Isgar. One of the coppers who stayed behind became the leader of a resistance cell based in Westcrown.

Tyraxalan's ragged and harried group of loyalists continues the civil war that officially ended 7 decades ago. Although they garner some minor sympathy and support among the people of Westcrown, the lives of most Chelaxians have improved in the past several decades, and those who do help Tyraxalan and his freedom fighters do so more out of pity than any belief in their cause. Tyraxalan keeps himself hidden in the form of a human scribe known as Tyrax. In this guise, Tyraxalan occasionally sends messages to his friend and infrequent supplier Sarithil, a particularly famous brass dragon expatriate living in distant Manaket.

TACTICS

Before Combat Thanks to his loyal band, Tyraxalan is rarely surprised, and so he generally has time to cast *stoneskin*, *invisibility*, *see invisibility*, and *mage armor* before a fight breaks out.

He tries to prevent combat by using *calm emotions* and *sleep*.

During Combat In the first round of combat, Tyraxalan usually casts *haste* on himself and his allies, following it with *sleep* on the next round. He tends to fight defensively, curing and aiding his allies and diminishing the fighting strength of groups of foes with his breath weapons. Tyraxalan and his allies prefer hit-and-run tactics, and they might withdraw for hours before returning to harry their enemies.

Morale If in his lair or defending his companions, Tyraxalan fights to the bitter end. Otherwise, he attempts to hamper his enemy's ability to pursue him before slipping away.

Base Statistics Without his spells cast, Tyraxalan has the following base statistics: **AC** 33, touch 8, flat-footed 33

SPECIAL ABILITIES

Spider Climb (Ex) Tyraxalan can climb on stone surfaces as though using the *spider climb* spell.

Gold Dragons

Majestic and wise, gold dragons seem less like truly living creatures than minor godlings performing good deeds directly upon the world. Some live for centuries cloistered within human monasteries or temples, granting advice to those who ask. Others rally their cousins to battle against some great evil. Most watch the slow passage of time move across the world, bringing with it constant change. In a world ever in flux, it is the unmistakably powerful golds who seem to remain unchanging fixtures within it. Constant. Trusted. Comforting.

—*Drakanav Codex*, Chapter 16

The greatest of all dragons by nearly any metric, gold dragons benevolently reign over their metallic kin and command respect and awe from their chromatic cousins. Even the most powerful red dragons bear grudging respect for gold dragons—and hate them all the more for it. Gold dragons epitomize all that is good, orderly, and draconic. When poets and dreamers think of benign dragons, they think of the patient and kind golds.

By far the wisest and most intelligent of the metallic and chromatic dragons, gold dragons spend a great deal of time contemplating various considerations or problems that interest or vex them. Gold dragons do not mind providing their insights to those who ask, particularly if the inquired topic mirrors one of their own interests. As such, many creatures seek out gold dragons for advice, insight, and information. Golds make for careful and unhurried advisors, and they sometimes ponder a situation brought to their attention for several days, lapsing into deep thought and ignoring their visitors. Golds speak with an economy

of words, and expect others to lend greater heed to their carefully considered remarks.

When dealing with other creatures, gold dragons prefer to guide and advise. When coerced to act they become terrible to behold in their righteous fury. Even when pitted against chromatic foes (directly or otherwise), gold dragons choose words over violence, and many chromatics who are redeemed can thank patient but forceful golds for their enlightenment.

Gold dragons possess two large sweeping horns that extend back and up from their skulls, and most bear a few hornlets at the ends of their chins, which appear from the distance like small beards. Other than these features, the faces of gold dragons vary widely. Many possess dozens of hornlets projecting from their jaws, cheekbones, and eye ridges, while others bear only the two main horns and no other facial projections. Regardless of horn numbers, all golds reflect light to shine like the sun.

ECOLOGY AND SOCIETY

Whereas most other dragons prefer enclosures and defensive structures, living within caves under engulfing forests or thick mountains, gold dragons favor the wide-open expanses of grasslands and plains. Many speculate that gold dragons happily live in the open because they have nothing to fear. They are the most powerful of dragons, so their cousins rarely ever challenge them, and their unbreakable goodness means that would-be dragonslayers generally have no reason to hunt them. Regardless of their reasons, gold dragons do live exposed lives. Their lairs, such as they are, are often wherever the dragons bed down for the night, although like all other dragons they do prefer to sleep upon beds of coins. For this reason, gold dragons sometimes carry their hoards with them, though they commonly conceal their treasures or make them magically inaccessible.

As plains dwellers, gold dragons live off the many herd animals that roam across their preferred environment. Gold dragons are careful hunters, and never take more game than herds can replace. Like other predators, they routinely prey on the slow, the old, and the infirm, thinning the weakest members from the herds. Ever mindful of their impact on their surroundings, gold dragons also sate their hunger by grazing on the grains of various grasses and the high leaves of what few trees live in their domains. Thanks to the culinary advancement of humans over the past several millennia, gold dragons have grown a liking for carefully spiced foods. When they live among humans in cities or elsewhere, gold dragons often find one particular inn, restaurant, or tavern that spices its food exactly to their liking. They then support their favored establishments for as long the food remains constant and consistent,

and in some cases more humanized golds even purchase their favorite eateries.

Of all dragons across all the many spheres, golds are the least likely to tarnish, rampage, or otherwise act in a manner unbefitting their legendary dedication to the goodly concerns of law and order. What gold dragons consider benign assistance and benevolent leadership can sometimes clash with the ideals of other creatures, and in this way gold dragons do very occasionally enter into well-reasoned and passionless arguments. Their ability to divorce their emotions from their decisions makes them invaluable if frustrating advisors and confidants, and because of their inviolacy gold dragons are almost universally valued by all creatures who respect wisdom, temperance, and knowledge—including some chromatic dragons.

Serene and good-natured, gold dragons listen more than they speak and consider more than they act. Their unmatched wisdom and unequalled dedication to goodness place them in a position to be valued advisors to mortals and celestials alike, and their endless capacity to care for and about other creatures makes them consummate advisors and patrons of goodly beings.

Gold dragons enjoy the company of all good creatures, although they prefer those who adhere to order and predictability. Occasionally, gold dragons meet with angels and other divine good beings to discuss matters of concern on Golarion. The Worldwound continues to vex gold dragons and their celestial allies, and despite their best efforts (which generally involve sending more silver dragons into the fray) the Abyss's encroachment onto Golarion continues unabated.

Although they prefer the company of their own kind, gold dragons happily meet and converse with all their metallic kin. Gold dragons who live within a few days' flight of one another meet several times a year, ostensibly to discuss their continued attempts to spread their philosophies among their neighbors, but usually to simply chat and drink wine. In addition to these meetings, once or twice a year a gold dragon hosts a number of metallic dragons—usually only bronzes, silvers, and other golds, but occasionally also brasses and coppers. These gatherings are inclined to be more serious and sedate, with long discussions about the state of the world and what the dragons can do to improve it. Very rarely, certainly not more than once or twice a century, a particularly powerful gold dragon might call for a full convocation of dragons (see the Convocation of Dragons sidebar on page 14).

Many gold dragons also serve as mentors to their silver cousins. Those who accept such an honor take their roles very seriously, working hard to keep their dedicated charges to the hard path of justice and righteousness. Gold mentors to silver dragons make themselves available

to their cousins several times a month (or even more often, in times of great need), and the golds know to seriously consider everything their charges tell them. Experience has taught gold dragons that what might seem trivial and pointless to them can tip their silver charges to the point of tarnishing. Fortunately for the silver dragons lucky enough to acquire gold mentors, gold dragons are nothing if not patient, and their desire to aid their lesser cousins exceeds even the neediest silver dragon. Not every gold dragon mentors one of his silver kin and those who do never take on more than one silver dragon charge at a time—experience has taught the golds that having too many charges can be trouble for all involved.

Like many of their kin, gold dragons increasingly live among Golarion's humans, either in the guise of wizened humans themselves or else in their natural forms. In general, when they live within human settlements, gold dragons prefer the former approach, blending in with their neighbors and representing over the course of centuries an array of different human covers. Some golds become so attached to their false personas that the dragons then also portray their descendants, creating whole families represented in society by one member at a time. Eventually, after a few generations of otherwise single humans suddenly producing grown children, a few neighbors may catch on. Even when their covers are blown, though, the golds are apt to simply remain in the forms known to the townsfolk, and then live as either their exposed covers or other favored personalities for hundreds of years. Although gold dragons greatly prefer to live in cities where law and order prevail and serve the greater good, they recognize that they are needed far more elsewhere. For this reason, gold dragons are rumored to live in numerous cities of questionable morality throughout Avistan and Garund, including Ardis, Egorian, Korvosa, Pangolais, and Sothis. When they live in monasteries or other places of learning or contemplation not publicly open to visitors, gold dragons are prone to exhibit their true forms—except when their size becomes an inconvenience. This practice is far more common on the other continents, especially Tian Xia.

Like all dragons, golds know exactly the origin of dragonkind, who their god is, and what he represents. As the eldest of all dragons, if only by a matter of hours or days, gold dragons take upon themselves the responsibility of acting as older siblings for all other dragons, speaking with Apsu on behalf of their kin and reporting to their cousins his declarations. In this way, many consider gold dragons the clerics and priests of Apsu, but they gently correct such suppositions and explain the relationship is more aptly described as father and eldest child. Semantics aside, golds communicate directly with Apsu more than any other kinds of dragons, and Apsu seems to favor contacting gold dragons when he needs to communicate

with his children. This connection with their living god-king feeds into their draconic arrogance and causes many younger gold dragons to take on an air of smugness around their cousins, which their kin understandably do not appreciate. Older gold dragons suppress these feelings, as they realize that Apsu does not tolerate such a boastful show of pride between his children (although he encourages dragons to act with dignity and pride among the lesser races).

HOARD AND HOME

Gold dragons live, when allowed their choice, upon vast, open stretches of warm grassy plains and prairies. These grasslands offer them an abundance of foods, from the hard seeds of tall grasses to the skittish herd animals that graze upon them. In the early morning hours, gold dragons rise and watch the sun spread its warming light upon the land. They sit in quiet contemplation or meditation, allowing their magnificent bodies to soak in the warmth of the brightening sun. As they fear no creatures, even the hate-filled reds who constantly vex them, gold dragons alone among their kin feel no anxiety in sleeping in the open, under the bright stars of the dark night.

Despite their fearlessness, though, gold dragons do maintain protected lairs near their favored nesting spots. Often, these underground homes open onto narrow but sharp breaks in the landscape, where fissures or short cliffs form from geologic action or the slow erosion of topsoil. Even the flattest prairies offer the occasional breaks in their monotony, and those rare few that do not are not suitable homes to gold dragons.

Golds do not mind engaging in physical labor, so when natural caves do not appear in fissures and breaks, the dragons dig. Thanks to their extreme intelligence and good instincts, gold dragons can identify areas where natural underground open spaces are likely to occur. The golds, therefore, do not mind digging through rock and clay for several hundred feet in order to stumble across one of these cave systems. If, after a few hundred feet, the gold dragons do not uncover such caverns, they give up and search again elsewhere. In some parts of Avistan, plains and grasslands are erratically marked with dozens of these dead ends—many of which serve as the homes of creatures far less picky than gold dragons.

Once they establish their lairs, gold dragons work to set up defenses and form mutual aid pacts with their neighbors. Occasionally, gold dragons put out calls to their human allies to relocate, at least temporarily, in order to aid the dragons in protecting their lairs (and thus, their hoards). In addition to trustworthy human allies (who the golds carefully and subtly screen long before they petition for aid), gold dragons also invite celestials,

the occasional blink dog, and other creatures that prove themselves dedicated to justice, morality, mercy, and the greater good.

Gold dragons do not like to set traps, as the devices sometimes go off on creatures that belong within their lairs or fail to trigger on intruders, but instead prefer living, thinking defenders who can employ judgment and restraint—two qualities mechanical and magical traps always lack. That said, golds do favor impediments in their lairs that can slow and frustrate trespassers, such as short walls, flooded areas, twisting mazes, and other non-harmful features. Those in the know can navigate or bypass these annoyances with carefully hidden shortcuts or other tricks.

At the heart of a gold dragon's large cave complex spreads his hoard chamber, possessing several sections usually separated by shelves of different heights. A gold dragon keeps his coin bed in a depression on the highest shelf, with the rest of his hoard divided by form and function on progressively lower levels of the chamber. In general, the second-highest shelf goes to the dragon's library, the third to his collections of magic and art pieces, and the lower sections to his mundane and natural collections.

The heart of a dragon's hoard is its vast coin beds. Unlike their cousins, though, gold dragons prefer sprawling, shallow coin beds rather than more compact and deeper ones. Their coin beds commonly contain solid gold and silver objects of questionable artistic merit, such as bars, rods, undecorated candelabras, and worn or broken statuary. The dragons carefully remove any surviving gems, jewels, pieces of glass, or other ornamentation not made of precious metals before adding these pieces to their coin beds, and only if doing so does not significantly reduce their value.

Like bronze and brass dragons, golds collect a wide array of books, scrolls, clay tablets, and items representing all other forms of written communication. Whereas brass dragons tend to collect information about the people in their networks of contacts or guidebooks to where they live, and bronzes fill their hoards with ancient and dusty histories and other research materials, gold dragons collect books, scrolls, and such for the sheer joy of owning them. Voracious readers, gold dragons consume new acquisitions with true zeal, putting aside a few days to quickly read through their newest additions. Thanks to

their incredible intellects, these quick read-throughs allow them to comprehend most of the knowledge presented in the works, but despite these quick perusals, they almost always go back later for less hurried, more mindful readings.

Gold dragons place items of magic and pieces of art below their coins and books in relative importance. This should not suggest the dragons do not care for such things and might forgive thieves who remove art or magic from their hoards, but simply that the golds place greater emphasis on the care and protection of their coin beds and libraries. In the area of art, gold dragons do not maintain any sort of species-wide specific preferences, although individuals regularly favor one or two kinds over all others. The gold dragon Tesla collected crystal wine glasses, for example, and at his death his heir counted more than 2,400 of the delicate items in velvet-lined display cases.

CAMPAIGN ROLE

Gold dragons lead by example and by offering sometimes-cryptic advice. Through their connections with Apsu and other powerful extraplanar champions of good and forthrightness, gold dragons frequently know or hear hints of great evils plaguing the world. As architects of actions and strategists of almost unparalleled skill, gold dragons rarely confront these threats directly (the major exception being the rise or rampage of some powerful red dragon). Instead, gold dragons delegate the responsibilities of heroic actions to other beings—almost always those who

would be most affected by the looming threat. In this way, gold dragons orchestrate or influence important quests that advance the cause of good and bring glory to the people who perform them.

Like most draconic manipulators, gold dragons prefer to work behind the scenes, out of the limelight, and preferably with their meddling undetected by those they empower. More conniving than even the most ambitious blues, gold dragons keep track of hundreds of threads of possible outcomes. They create contingencies and develop sleeper agents of such sublime subtlety that other dragons and masterminds cannot hope to identify them until the need for such redundancies occurs—and sometimes not even then.

Unlike blue dragons, gold dragons do not mind speaking directly with lesser beings, even those not connected to dragonkind in any way. Gold dragons recognize that, despite their incredible intellects and superior wisdom, they do not and cannot see and know everything. At times, beings approach them for advice or knowledge in order to advance some goodly quest whose purpose is completely unknown to the golds. With their massive libraries and vast memories, gold dragons are living repositories for information other creatures might find useful, and of this they remain quite aware. Thus, when beseeched for their wise council or knowledge, gold dragons acquiesce and share what they know or suspect (but only after the petitioning creatures prove themselves worthy of such aid).

ON GOLARION

So incorruptible are gold dragons that the Obelisks of Destiny record only one of their kind who forsook his species' righteous ways and fell into darkness and insanity. For nearly 150 years, Kwislingyr of the still-shamed Aleirt bloodline terrorized western Taldor and its colonies in Andoran. Although several gold dragons attempted to redeem him and a number of dragon-slaying expeditions set out to hunt him down, his months-dead corpse was discovered by a group of dwarven ore-hunters quite by accident. When they saw his corpse, the dull yellow of his scales and his emaciated body twisted in madness led them to believe they had discovered a new species of dragon (see The Yellow Dragon sidebar on page 43). After numerous experts refuted their claim and most of the rumors died down, the dwarves took Kwislingyr's corpse on a tour of several dwarven Sky Citadels before the gold dragon Winsilax gently asked them to inter it.

Probably the most famous gold dragon on Golarion is Mengkare, the founder and benevolent dictator of the island nation of Hermea. Many speculate that the Nirvana dragon also is, or was, a gold dragon of some unequalled power and majesty. Gold dragons, for their part, politely deny such suppositions. The Nirvana dragon never quite

seems to hear the question correctly and answers some random and unasked question instead.

NAMES

Gold dragon names can be longer, more complex, or harder to pronounce than those of most of their metallic kin, but golds often use shortened forms for casual conversation or when dealing with non-dragons. Many golds from the Aurixia clan (the pure bloodline) bear a portion of their foremother's name in theirs, as the word for "gold" in Draconic is itself "aurux."

Gold Dragon Names: Aurexiar, Dararthurian, Edvarthixian, Marathaliar, Raurix.

ASTARATHIAN

In the darkest corners of the world, gold dragons sometimes dwell. There, they act as shaded beacons of light, revealing their true forms only to those they learn to trust implicitly. Thus it is that Astarathian, one of the most powerful dragons in Avistan, lives in a place least open to the ideals of goodness. Within the Nidalese capital of Pangolais, Astarathian lives in the human guise of a simple greengrocer, providing the people of the city with staple foods at lower costs than anyone else. Indeed, local legends hold that those who say the right things to him receive their food for free.

Although he has lived in Pangolais for nearly 450 years, Astarathian has never kept the same disguise for more than a few decades, and he never portrays family members of his previous false selves. In his years within Nidal's capital, Astarathian has provided hundreds of frightened, starving people with food and shelter and has given hope and encouragement to those who seek to release Nidal from its long, dark curse. Only once has Astarathian taken to the sky over the city in his true form, in the year 4519. The people still speak of the shining golden dragon to this day, referring to the event as the Night of the Golden Moon.

TACTICS

Before Combat Astarathian prepares for battle by casting *mage armor*, *owl's wisdom*, *protection from evil*, and *shield*. He always has *mind blank* and *detect scrying* active, and if he anticipates battle in the near future he enhances himself with *protection from energy* (acid, cold, and electricity).

During Combat In the first round, Astarathian uses *time stop* to gain rounds so he can encase his foe with *wall of iron*. If that proves unsuccessful, he casts *haste* on himself and uses *time stop* and *wish* to their maximum potential. Against obviously evil foes, Astarathian is ruthless, but even against such beings he stops if they ask for mercy. When facing foes of uncertain morality he is more reserved and attempts to incapacitate rather than destroy.

Morale Astarathian only fights to the death in order to protect his lair or the lives of innocents. Otherwise, he withdraws carefully if reduced below 350 hit points.

Base Statistics Without his spells, Astarathian has the following statistics: **AC** 42, touch 2, flat-footed 42; **Fort** +33, **Ref** +22, **Will** +33; **Wis** 33.

SPECIAL ABILITIES

Alternate Form (Su) Astarathian can assume any animal or humanoid form of Medium size or smaller as a standard action three times per day. He can remain in his animal or humanoid form until he chooses to assume a new one or return to his natural form.

Detect Gems (Sp) This is a divination effect similar to a *detect magic* spell, except that it finds only gems. Astarathian can scan a 60-degree arc each round: by concentrating for 1 round he knows if there are any gems within the arc; 2 rounds of concentration reveals the exact number of gems; and 3 rounds reveals their exact location, type, and value. This ability is the equivalent of a 2nd-level spell, and he can use it 3 times per day.

Luck Bonus (Sp) Once per day, Astarathian can touch a gem and enspell it to bring good luck. As long as he carries the gem, Astarathian and every good creature in a 120-foot radius receives a +1 luck bonus on all saving throws and similar rolls (as a *stone of good luck*). If Astarathian gives the gem to another creature, only that bearer gets the bonus. The effect lasts 1d3+36 hours but ends if the gem is destroyed. This ability is the equivalent of a 2nd-level spell.

Water Breathing (Ex) Astarathian can breathe underwater indefinitely and can freely use his abilities while submerged (the cone of fire becomes a cone of superheated steam underwater).

Green Dragons

Greens are obsessed with perfecting their minds and bodies, and exceed even the learned bronzes in scholarship and study. Many chromatic dragons consider the greens traitors, for they seem more interested in learning than rampaging. Indeed, several attempts by metallic dragons over the past few millennia to redeem chromatic dragons en masse began by targeting the greens; of course, all such grand attempts failed miserably, and it is doubtful that dragons as a race will entertain such an idea again for at least a millennium.

—*Drakanav Codex*, Chapter 17

Green dragons strive for self-perfection and constantly work to improve themselves. This applies to both body and mind, though more so to the latter. Many who deal with dragons consider greens the most reasonable and pragmatic of the chromatic dragons, and most attempts to reach some form of agreement between the two draconic sects involve green dragons—particularly those attempts with any actual chance of success. When approached correctly—which generally means not when they are in meditation or asleep—green dragons are the chromatics most often willing to converse with uninvited guests. Despite their reasonable personalities and openness to visitation, however, green dragons remain undeniably evil, selfish creatures, and those fools who forget this tend to wind up as snacks.

In every aspect of their lives, green dragons seek mastery. Their unending and unrealistic push for achievement often focuses strongly upon their own persons, and green dragons practice moderation and self-control on levels approaching that of golds. As a result, green dragons are the

least likely of chromatics to rampage and the most likely to shed their evil ways. Few become truly good, but more green dragons slip into hard-edged neutrality than all other chromatics combined. Some scholars estimate that as many as one green in 10 finds sufficient enlightenment to embrace academic neutrality, but most draconic sages agree the number is much lower.

Of the chromatic dragons, greens are the only type who consider academia a worthy pursuit. They fill their lairs with books and scrolls, and despite their hatred of the lesser races they give begrudging thanks to the industrious humans who record knowledge in such a convenient and portable format. Green dragons serve as the scholars and wizards of the chromatics, and their contributions to mathematics, astronomy, and the understanding of Golarion's calendar are numerous but often woefully undervalued or miscredited.

The single massive horn projecting from a green dragon's snout gives it the most striking and easily recognizable head shape of all true dragons. Every green dragon's iconic nose horn bears a unique shape, though it continues to grow all throughout the dragon's life. Some great wyrms have a horn so massive that they gain a blind spot in their vision, and to correct this they sometimes carve the horn into a smaller, more suitable shape.

ECOLOGY AND SOCIETY

Green dragons constantly seek to become stronger, faster, smarter, wiser, and calmer. Already among the most socially adjusted of the chromatics (exceeded only by the manipulative blues), green dragons occasionally introduce themselves into situations they find frustrating or annoying simply so they can practice remaining calm and patient. These attempts usually work, but when they don't, someone generally loses a limb.

In order to keep their bodies in peak physical condition, green dragons perform some form of rigorous exercise nearly every day (like all dragons, they enjoy long slumbers, but try to limit their naps to a few days at a time). These exercises typically include flying, running, or swimming at their maximum pace for at least an hour. Other days, greens derive their exercise from combat, either sparring non-lethally with other greens and the occasional blue or else attacking creatures they perceive as challenging but not especially dangerous.

The sparring and battling they do also help keep greens mentally strong, but most prefer other forms of intellectual exercise to accumulating tactical know-how. Green dragons naturally excel at mathematics and frequently become experts in magical theory (although their talents in the practical application of magic tend to lag), astronomy (they consider astrology charlatanry), and intricate measurements (such as of time or items very large and very small).

Although their intellectual curiosity rarely leads them to an interest in horticulture, green dragons possess natural abilities that make them excellent cultivators and caretakers. They feel they must constantly improve upon their forest homes (at least the sections they can see directly from their lairs). Green dragons rarely care for their forests directly, but they frequently coerce or otherwise force lesser creatures into aiding them as caretakers and groundskeepers. Over time, thanks to the efforts of the dragons, the areas around their lairs tend to become healthier and more vibrant, a sharp contrast to other chromatics. Welcome plants grow quick and healthy, while parasitic vines and other unwanted vegetation are either much reduced or eliminated entirely. As flexible omnivores, green dragons can and do eat almost anything, from fresh meat to berries to leafy plants. They refuse carrion and only eat creatures they kill themselves.

Whereas blue dragons tend to socialize in order to establish control over or contact with different creatures, green dragons speak with lesser beings in order to gain knowledge. This sharing of information is not altruistic, but rather to gain prestige for their discoveries and breakthroughs and to learn from those of others. When green dragons present newfound information to colleagues, they do so with written proofs and journals that clearly spell out their findings and establish them as the original discoverers of the knowledge they pass on. In this way, green dragons contribute to the draconic body of knowledge without fear of their findings becoming misappropriated, lost, or claimed by another dragon—or worse, by a lesser creature.

Green dragons tend to stay away from other kinds of dragons, whom they see either as unpredictable hooligans or insufferably stuffy killjoys; the exceptions are bronzes, whom greens respect as scholars. Greens tend to work together with bronzes more than with any other dragon kind, losing themselves in deep, intellectual conversations. When confronted with their own kind, green dragons become standoffish and competitive. As perfectionists, they cannot help but compare themselves to their kin, and meetings of two greens almost always turn into bouts of one-upmanship that result in physical brawls or magical duels. Only when greens come together to mate can they temporarily repress these competitive tendencies. Even then, however, the dragons cannot help but feel themselves smugly superior to their partners, and on occasion these trysts end violently when one partner points out a flaw in the other.

The scholarly and rational greens rarely develop any great amount of piety or religious fervor. They intellectually understand and occasionally study the creation of dragons and the betrayal of Dahak, but they do not revere Apsu in any capacity other than as the greatest

of all dragons and—ultimately—the king of the metallics. Strangely, even as they reject their own draconic deities, some greens actively worship a human god: Irori, god of self-perfection. These greens see in Irori the ultimate in personal potential, and they judge themselves against his pursuit of perfection, wisdom, and calm, believing that the reward for ultimate self-improvement is ascension to godhood. Other greens deride this faith as the “Cult of the Man God.”

More often than any other chromatic kind, green dragons explore the theoretical mysteries of arcane magic as archmages and wizards of great repute. Their experiments and studies frequently lead to new and dangerous discoveries, though just as often these investigations into things best left alone result only in insanity or death. Green dragons take these risks to push the boundaries of theoretical knowledge in the hopes of being remembered throughout history for their achievements. In order to conduct these experiments, green dragons happily sacrifice as many lesser creatures as they need to, gleefully sending dozens of humans or even other dragons to gruesome and unspeakable deaths. Green dragon wizards

do not collectively favor any one school of magic over the others, but individuals almost always specialize. This tendency carries over into non-wizard greens as well, who do not focus on any one school or type of magic.

HOARD AND HOME

Green dragons favor knowledge and collected wisdom over other treasures, although they also enjoy the shape and feel of items made from darkwood and certain other materials. Like all dragons, greens love coins, and tend to prefer copper and silver over gold or platinum. As scholars, green dragons also favor older coins from extinct nations, and in many cases the coins of their hoards are worth more to collectors than their face values indicate. Green dragons enjoy verdant gemstones such as emeralds and peridot which reflect the color of their own scales.

The hoards of green dragons always contain large libraries of books and scrolls, typically of advanced mathematics or numerology and at least one other subject that strikes the particular dragon’s fancy. A number of these tomes and manuscripts are unique, having come down to their owners through successions of masters and apprentices or else penned by the hoard owners themselves. Unscrupulous scholars, mathematicians, and arcane researchers frequently put out bounties for the deaths of green dragons solely for the purpose of gaining access to these documents. These vendettas usually end in the deaths of those who propose them and their would-be dragonslayers.

As the chromatic dragons of forests and growing places, green dragons enjoy wooden carvings and elaborately decorated wooden furniture. Many greens collect wooden canes, cudgels, and walking staves made from oak and other beautiful woods, giving their hoards high percentages of magical examples of such items. Green dragons do not exclusively appreciate the beauty of worked or magical woods, however, and those who live relatively near coastlines frequently collect driftwood of unusual shapes and colors—something that never fails to confuse thieves expecting only valuable items.

Regardless of the exact makeup, all green dragon hoards are carefully and exactly organized. Books always end up back on their shelves, usually ordered

alphabetically by subject. Art objects, weapons, and suits of armor have their specific places, usually under glass to protect them from dust and grime. Even the wide, shallow beds of coins on which green dragons sleep are kept within very specific boundaries, typically with the help of perfectly circular indentations in the floor. Woodcarvings and the like are always carefully arranged around the coin beds. Green dragons keep their hoards meticulously clean and organized, and as such they can tell at a glance if something is out of place or missing, making their hoards among the most difficult to subtly pilfer.

Green dragons live in forests, preferably at the hearts of old woods near groves of ancient trees. They like to live in caves, but many settle for natural cairns, the burial mounds of lesser creatures, or simple stone-lined and covered pits dug for them by unwilling neighbors. When they live in caves or caverns, green dragons like to conceal the entrances to their homes with thick bushes, vines, and other greenery.

With their corrosive breath, green dragons can slowly melt their way through solid stone in order to delve into the sides of hills or create hollows within mounds of stones. They rarely use their acidic exhalations on trees or other plant matter, instead trusting to magic or their own physical labor to produce lairs high in the trees.

When not living within caves or burial mounds, greens prefer to make their homes on the sides of hills or at the tops of cliffs. Some, particularly younger and smaller ones, live within the high boughs of massive and ancient trees. Some treetop lairs of the oldest green dragons can rely upon the collective strength of more than two dozen massive trees, their upper reaches bowing under the draconic weight. These immense lairs (created by carefully meshed ropes, chains, cables, and vines) are engineered by the dragons to support weights far exceeding their own. This allows the greens to keep at least portions of their hoards within their tree-borne bowers.

Whether aboveground or below, green dragon lairs are generally built near at least one tree with a bough large enough to support the dragon's bulk, from which it can survey its demesnes. (Of course, this becomes extremely difficult to find for the largest dragons). Green dragon lairs rarely contain standing or running water. In caves, green dragons keep their books and the rest of their hoards organized on large wooden shelves or in glass-enclosed displays (preferably of exquisite quality and made from darkwood or hardwoods). In tree lairs, they carefully and patiently guide the boughs and trunks of the trees into particular shapes to make them useful for storage. The oldest green dragons living within trees occasionally even have safes and strongboxes grown into the trunks of their tree homes—a process that takes hundreds of years to complete.

THE YELLOW DRAGON

Amateur scholars of draconic lore are quick to point out that as there are blue and green dragons, and mixing blue and yellow pigment creates green, there must be yellow dragons, forebears of the green dragonkind. Though there are no known chromatic dragons that were actually yellow, there is one famous metallic who helped perpetuate the myth.

With each appearance, the fallen gold dragon Kwislingyr's scales lost more luster until—upon the discovery of his corpse—they were reduced to a sickly yellowish hue. His pallid skin and the subsequent discovery of his emaciated corpse led to wild speculations of the arrival of a new species of yellow dragon. Draconic scholars and representatives of the Aleirt bloodline quickly hushed those rumors when they confirmed that the so-called “yellow dragon” was actually the fallen gold, Kwislingyr. Despite their refutations, however, rumors of yellow dragon sightings still infrequently crop up all across Avistan, and even more so in Garund.

CAMPAIGN ROLE

Green dragons can play a wide array of roles depending on their individual interests. Although almost universally and unrepentantly evil, green dragons are never mindless marauders or senseless slayers, and are all the more terrifying as opponents because they always have purpose behind their actions and more than one means by which to accomplish their goals.

The most basic manner in which green dragons antagonize humans is simply as defenders of their territory: greens do not suffer humans stumbling around on their land. Unlike most other chromatic dragons, though, green dragons do not automatically attempt to kill trespassers. Indeed, doing so frequently just results in the arrival of even more humans. Instead, greens try to drive off unwanted guests, often using methods that do not reveal the dragons themselves.

Many green dragons seek knowledge, either magical or mundane, that other academic or intellectual dragons (such as their bronze rivals) do not dare or care to find. In the name of science and understanding, green dragons occasionally perform experiments on live subjects. These particular forms of research require steady supplies of test subjects, leading the dragons to frequently seek out new victims, dragging their uncooperative test subjects back to their lairs for vivisection. Clever greens create nonlethal traps to more easily acquire such “volunteers.”

As seekers of knowledge, green dragons also occasionally explore ancient tombs or other places of historic or magical interest. If a site is newly discovered, a particularly adventurous green might attempt to delve into it before its fame draws too many other explorers. Thus it is possible

for human adventurers and green dragon explorers to simply stumble into each other, particularly if they are both in a location only recently revealed.

As they are among the most thoughtful and least violent of chromatic dragons, green dragons do not mind sharing what information they possess with lesser beings. These lessons never come freely, of course, and those petitioning greens for intellectual aid should bring their own secret knowledge to share. Some green dragons accept books, scrolls, coins, and other physical treasures as payment for the information they provide, but most require the human knowledge-seekers to perform tasks for them in exchange.

ON GOLARION

Nearly every significant forest on Golarion is home to at least one green dragon, from the boreal forests in Irrisen to the steaming jungles of the Sodden Lands and all major woodlands in between. For the most part, green dragons dwell in quiet isolation, keeping to themselves, emerging from their homes only to hunt or seek out some new fact or resource. For this reason, few notable green dragons are spoken of in human histories.

Perhaps the best-known green dragon, the famed and strangely popular Tasathyl, continues to live within the vast territory claimed by Daralathyl without bowing to his rulership. Although much smaller and obviously weaker than Daralathyl, Tasathyl openly defies the king of dragons and continues to live to tell of it. Since her arrival in Arthfell Forest sometime shortly before 3300 AR, Tasathyl has faced off against King Daralathyl on at least nine known occasions. Every battle begins in the air, but eventually the two tumble to the ground, crushing everything beneath them. Twice these battles have fallen into an occupied area, with the resulting combat destroying homes and killing numerous unfortunate onlookers. When she isn't busy seeking new ways to kill her most hated opponent, Tasathyl possesses a voracious appetite for knowledge and information. She frequently hires explorers and adventurers to comb the dwarven ruins near her home.

More famous for his accomplishments than for his politics, the late Gartheris discovered within his small woodland observatory two of the known planets of Golarion's solar system, as well as numerous comets and other celestial bodies. Those dragons who cared about such things hailed his discoveries and claimed draconic superiority in the field of astronomy. However, a team of unscrupulous human astronomers managed to disseminate this information about the discoveries before the dragon could, naming them Triaxus and Apostae, much to the anger of green dragons and the chagrin of bronzes. Gartheris and his colleagues seethed at this for nearly a

decade before putting the final touches on their master plan of vengeance, wiping away the human usurpers, their publishers, and their families with veritable storm clouds of acidic breath. Since then, human researchers wisely grant credit where it is due, at least when dealing with green dragons.

NAMES

Green dragon names fall somewhere in the middle of the draconic spectrum for length and complexity. They tend to be relatively easy to pronounce (if not to spell) and they generally eschew the use of titles and other epithets. Female green dragons frequently have names ending in the syllable of "vox." Beyond these generalities, green dragons do not practice any particular naming conventions, although fathers tend to grant their offspring names that incorporate one or two syllables of their own names. For example, the famed astronomer Gartheris fathered Athervox, Gardras, and Theristix.

Green dragon names: Arithalion, Dastrivox, Karsitran, Saevox.

ATHERVOX

Daughter of the famed astronomer Gartheris, Athervox spent many of her younger years toiling in earnest beneath the impressive shadow of her sire's previous discoveries. Upon his death almost 7 centuries ago, Athervox gained possession of his mundane and magical astronomical equipment, and with this windfall of information and tools she set up an observatory near Senara in the Whisper Woods of Cheliah.

With the rise of the Hell-backed House of Thrune, Athervox saw her chance to gain some level of assurance from the governing humans that she could conduct her studies in peace. In exchange for privacy, however, the government in Egorian required Athervox to train a handful of human astronomers loyal to House Thrune. Athervox assumed her "apprentices" were merely spies sent by the crown to see the manner of her research, but kept up the pretense of teaching. After a few years of training, the humans abruptly left one night, taking with them several volumes of Athervox's notes on astronomical connections to the spheres of existence.

Several decades have passed since the Thrune agents ran off with her notes, and in that time no humans have bothered Athervox who she did not herself invite. Despite Cheliah's apparent upholding of its end of the deal, Athervox cannot bring herself to trust humans, even though she frequently needs them to perform menial or dangerous tasks for her. The House of Thrune, for its part, would do well to remember that just because the dragon hasn't punished them yet for their insolence doesn't mean she's forgotten.

ATHERVOX

You are a dragon, powerful and feared. Not even magic can sway your thoughts or weaken your resolve.

Prerequisites: Wis 17, base Will save +10, any lawful alignment, dragon type.**Benefit:** If you are affected by a mind-affecting enchantment or necromancy effect and fail your saving throw, you can attempt it again 1 round later at the same DC. You get only this one extra chance to succeed on your saving throw.

(her favorite is to suggest the target leave, gather more allies, and return the next day better prepared to fight her, which gives her plenty of time to get far away) to end the combat or at least remove some of her foes from the battle. She uses her breath weapon and damaging spells to good effect, hitting as many foes as possible. Her hope is to deliver so much damage in so little time that her foes see the logic in breaking off the fight and switching to discussion. If Athervox can end a battle quickly, she tries to learn the names of her opponents so she can plan for her vengeance later.

Morale Athervox does not fight to the death outside of her lair unless she is somehow trapped and cannot escape. Once reduced to 200 hp or less, she flees. When defending her home, she fights until slain.**Base Statistics** Without her protective spells on her, Athervox has the following statistics: **hp** 362; **Fort** +22, **Will** +20; **DR** 15/magic; **Melee** bite +38 (2d8+11), 2 claws +36 (2d6+16), 2 wings +36 (1d8+5), tail slap +36 (2d6+16); **Special Attacks** breath weapon (DC 30), crush (DC 30); **Str** 33, **Con** 23, **Int** 18, **Wis** 19**Skills** Concentration +36, Knowledge (nature) +36, Knowledge (the planes) +36, Listen +38, Search +36, Spot +38**STATISTICS****Str** 37, **Dex** 10, **Con** 27, **Int** 22, **Wis** 23, **Cha** 18**Base Atk** +29; **Grp** +50**Feats** Alertness, Draconic Discipline, Flyby Attack, Hover, Improved Initiative, Silent Spell, Skill Focus (Escape Artist), Snatch, Still Spell, Wingover**Skills** Bluff +36, Concentration +40, Escape Artist +35, Hide +32, Knowledge (nature) +38, Knowledge (the planes) +38, Listen +40, Move Silently +32, Search +38, Spot +40**Languages** Auran, Common, Draconic, Sylvan**SQ** water breathing**SPECIAL ABILITIES****Water Breathing (Ex)** A green dragon can breathe underwater indefinitely and can freely use its abilities while submerged.

“The Mithral King came into our domain, telling us of the cataclysmic visions that filled his mind. The other angels and I saw our god die, and watched our domain slowly crumble around us as we wandered listlessly. Tashkax gave us purpose, and we saw in him the knowledge, foresight, and strength of a god. We had hope once more that we had found a worthy master.”

—Tirlunel, servitor of Tashkax

ECOLOGY OF THE MITHRAL DRAGON

By Logan Bonner

illustrations by Sam Wood

HISTORY

With wide-reaching goals and the power to achieve them, mithral dragons have played a major part in shaping the history of the world and planes despite their relatively small numbers. Since mithrals care primarily about pursuing their own goals, they derive far more satisfaction in completing them than in receiving praise or fame for their deeds. Mithral dragons have been involved in major swings of power throughout history, but few know of their involvement. Even fewer know how, specifically, the dragons shaped these events. Except for scholars with knowledge of religion or the planes, few people in the world even know that mithral dragons exist.

ORIGINS OF MITHRAL DRAGONS

No one knows for sure which legend of the creation of dragons is true. To mithrals, the details aren't particularly important. The only part of draconic history that really matters to mithral dragons is that they were intended to be Io's chosen. The god's spirit speaks to them still, and they follow Io's charge with greater commitment than any other type of dragon.

Though they have an association with the Astral Sea, it's clear that mithrals haven't always lived there. During the early days of the War of Dragons, mithrals fought against the chromatic dragons and helped decide the course of many battles. Over the course of that war, the mithral dragons grew more and more dissatisfied, and their numbers in the world slowly dwindled. Many mithrals claim that they weren't truly mithral dragons until they had left worldly matters behind and begun to consider more important concepts.

CRUSADING MITHRAL DRAGONS

Since the world fell into darkness and the great bastions of civilization crumbled, mithral dragons have grown more obsessive. They seek to radically change the world. Most of them want to transform it into a place of law and order, but their ideals can blind them to the consequences of their plans.

Mithrals have raised armies or instigated conflicts in attempts to set things right. Most influence affairs from behind the scenes, although a rare few have made their presence more openly known. Mithrals mostly find that they can inspire greater faith and camaraderie in their armies through the use of charismatic servants and allies.

AVATARS OF PROPHECY

The visions mithral dragons receive make them superlative prophets. These visions of the future come (the mithral dragons believe) from the spirit of Io. Though the dragons might struggle to understand these sometimes-cryptic bursts of foresight, they never doubt their veracity. However, they also know that the actions of free-willed individuals—for good or ill—can affect the results of any vision, no matter how sure it might seem. This contradiction worries those who dare question the motives and wisdom of these powerful creatures.

Still, great prophets keep a close eye on mithral dragons. Some attempt to tell the future by watching the actions of mithrals, believing that anything one of these dragons considers important will be significant. Mithrals largely resent their role as harbingers for lesser prophets. They prefer to keep their secrets, but they don't want to waste time covering their tracks. When necessary, a devious mithral dragon intention-

THE KING OF KHOURADAN

One of the most famous mithral dragons in the history of the natural world, Aelmedrion hatched while the edifices of the empire of Nerath crumbled. He grew up regretting that he hadn't lived to see an empire of the world in its full glory, and full of disdain for the evils that plagued the land afterward.

Impetuous as a youth, Aelmedrion hunted down necromantic rituals in libraries throughout the Astral Sea. As the dragon and his followers enacted these rituals, the graves of Nerathi soldiers opened up, and their occupants walked the land. The dragon declared the foundation of a new empire: Khouradan. To prove his beneficence, he set the undead soldiers to work slaying bandits, dangerous beasts, and other fiends that had overrun the world, but he did not prepare for his enemies' reactions. The dragon's evil adversaries had no idea who was attacking them and struck back indiscriminately against innocent people, either out of anger or while attempting to evade the undead armies by any means necessary.

After years of chaos, Aelmedrion appeared and admitted his failure. He returned the dead to their graves and personally dealt with the few prominent evildoers he was aware of. The rest went into hiding, and Aelmedrion fled to the Astral Sea in shame. As one of the few mithral dragons to reveal itself, most people who are aware of mithral dragons know about them because of this rogue necromancer.

Mithral dragons are immortal, and no news of Aelmedrion's death has reached the world. As far as anyone knows, the dragon is still out there, plotting a way to accomplish his goals more successfully.

ally misleads prophets by taking actions unrelated to its true goal. Some mithrals seem to pursue this sort of game with almost as much fervor as they do their true goals and passions.

PHYSIOLOGY

Though exceptional among their kindred, mithral dragons share most of the same physical traits. They are more nimble, though, exhibiting the suppleness of their namesake metal.

THE INNER LIGHT

Mithral dragon blood, like that of other dragons, contains stores of elemental magic. However, these creatures also command the radiance of the Astral Sea. They have dwelled primarily in that realm since their birth as a species, and their connection to the energy of the plane has increased over the millennia. When young, a mithral's scales are highly reflective. In later years, light glows from between their scales at all times.

Astral light has become so ingrained in mithral dragons that it has altered their breath weapons. As elemental energy passes from the fundamentum to the upper stomach, much of it transforms into radiant energy. As more energy collects, a mithral dragon's chest and throat begin to glow. This glow fades when the dragon unleashes its scintillating breath weapon.

When a mithral dragon becomes enraged, the light glows more fiercely. Even the dragon's claws and eyes flash with light during combat.

TELEPORTATION

Born with an ability to briefly cross between planes, a mithral dragon confounds its enemies with evasive teleportation. When a mithral dragon prepares to

teleport, its wings transmute into curtains of radiant energy. With a flash of light, the dragon crosses between planes and reappears nearby. Typically, the dragon crosses through the Astral Sea and reappears surrounded by motes of astral light. If it's already in the Astral Sea, the dragon usually teleports through the Elemental Chaos, and re-emerges accompanied by a tide of flame, cascade of dust, or gust of wind.

PSYCHOLOGY

Since mithral dragons are powerful, incredibly intelligent, and often fight for good causes, few realize how thoroughly consumed with their own goals these dragons become. Mithral dragons can become obsessive and domineering. Though they're typically on the side of the just, they can be misled into doing evil. With their prophetic insights, they might also seem to be pursuing an evil agenda for a goal they believe is for the greater good (or their own good, which to many mithrals, is one and the same). Even when devoted to a good cause, mithral dragons disregard the destruction and danger innocent people might face due to their actions in pursuit of their goals.

The type of goals a mithral dragon seeks to achieve varies widely. The only constant is scope—mithral dragons think big, and they choose to take on tasks that will influence entire continents or planes. A mithral dragon's goal might lead to the destruction of a barony, the disappearance of an entire landmass, the death of a powerful deity or demon lord, or the start of a great war.

SUPERIORITY

Mithral dragons know they are more powerful than other dragons, and act accordingly. They carry dragonkind's reputation for arrogance to extremes, and

they admit inferiority to no one, save perhaps deities or the most powerful primordials. Some mithrals consider themselves infallible, and even those who will admit to a mistake must be presented with overwhelming evidence to do so. Consequently, it's nearly impossible to dissuade a mithral dragon from following a course of action on which it has decided. Its prescience, in this case, is often a liability. Mithral dragons often come to believe that because of their gift of prophecy, they know more than anyone else—and they are thus often shocked beyond belief when events do not transpire as they expect.

REPRODUCTION AND PARENTING

Since mithral dragons don't die naturally and have few enemies capable of killing them, reproduction isn't a priority. Most mithrals are too consumed with their goals to find mates or rear children, and only do so if they're certain the time spent will further their agendas.

Mithrals rarely spend time with other dragons, even their own kind, so finding a mate is often difficult. A mithral dragon that wants offspring needs to either convince a potential mate that the offspring will contribute to both dragons' goals or arrange some type of exchange, usually by helping that mate further its own plans in some fashion. Sometimes two mithrals come together to raise hatchlings out of some deeper connection, but such relationships are even more rare among these dragons than among other species of dragonkind.

A parent that trains its offspring to further its goals uses harsh demands and instills in its hatchlings a sense of purpose. The dragon does everything it can to ensure that its child shares its goals, but inevitably, the parent grows distracted and neglects its children, leaving the hatchlings to their own devices. When a mithral wyrmling leaves the nest, many times a parent won't notice for weeks or months. In many ways, this preserves a balance among the mithral dragons, as few of those dragons related by blood end up pursuing identical agendas because of this distance that begins at such an early age.

MITHRAL DRAGON PLOT THREADS

You might want to use a mithral dragon to reinforce a theme in your campaign. These creatures loom so large that introducing one nearly demands that it will have a major role in the story arc of your game. Some interesting plot threads involving mithral dragons include:

Tyranny: Even a dragon working toward a good cause can impose stifling oppression over regions it claims to safeguard. The PCs might be fighting to free people from a mithral dragon's rules and restrictions.

Mysterious Prophecy: If the heart of your campaign's story is shrouded in secrecy, the PCs might enlist the aid of a mithral dragon. They could seek foresight from the dragon's visions, or try to prevent the dragon from finding out parts of a prophecy that would bring it into conflict with them.

Protect the Bystanders: The broad, intricate plots of mithral dragons ripple through the planes. The repercussions of a mithral's actions might harm ordinary people or fracture the land. Even at low level, PCs can protect people from the fallout of a mithral's actions.

CULTURE

Solitary beings, mithral dragons usually speak only with creatures who are their peers in power, and only when they must. Mithrals need to amass influence and knowledge to accomplish their goals, so they seek out only those allies who can offer them something that will further their own plans. The common person is useless to a mithral dragon, and is of no consequence to the dragon.

RELIGION

As residents of the Astral Sea, all mithral dragons acknowledge the power of deities, and most revere deities, or at least take their influence into account. Mithral dragons don't really worship gods in the same way most people do. They're simply too proud to submit to anyone else's will. They treat the gods with respect—at least those deities who share the same philosophies as the mithrals—and sometimes seek their guidance. Even this level of submission is galling to most mithrals, and they're more likely to treat such an interaction as one peer seeking advice from another, not as a lesser being seeking guidance from a "higher power."

It's not uncommon for a mithral dragon to realize that its goals align with a deity's. A mithral dragon that becomes deeply involved with a religion is a powerful symbol of that deity's influence, and few deities turn away such an ally. If the dragon is confident in the god's trustworthiness, it will present itself as a representative of the deity, using the combined cachet of the god's name and its own to fulfill the desires and goals the two share.

Whether in service to a deity or not, all mithral dragons pay attention to those deities whose tenets fit their goals or those who directly oppose them. The knowledge gathered by followers of Ioun can be useful to mithral dragons, so many of them maintain a connection to that god. Evil or immoral mithral dragons might follow the tenets of Zehir, who can help them with schemes that involve assassination. Vecna appeals to mithrals that want to scheme in secrecy.

The draconic gods and mithral dragons share an especially complicated relationship. Visions flow into mithral dragons' minds from the fragmented will of the dead dragon progenitor god Io. Therefore, the dragons follow this distant ancestor more closely than either of the living deities who commonly attract draconic followers. Bahamut and Tiamat simply can't live up to the majestic power of their father, in the minds of mithral dragons. To most mithrals, Bahamut isn't fulfilling Io's will, and Tiamat has turned her back on everything noble or worthwhile among dragonkind to pursue material things.

MITHRAL PATRONS

Always looking for competent allies, mithral dragons frequently serve as patrons for powerful adventurers. The dragon might seek them out because they share similar views, or simply because the adventurers will do what the dragon wants as long as they're paid well. Mithral dragons prefer to give direct orders, so characters who serve them might not have as much autonomy as they'd like. The only problem with a mithral dragon's orders is that they're sometimes based on vague visions. This means the characters might be expected to get results, but without a clear direction on how to achieve them or a good picture of the external factors that affect their quest.

UNDERLINGS

Mithral dragons attract numerous followers, either because they share similar goals, the dragon offers payment, or simply due to the lure of associating with a creature of such immense power. Because of a mithral dragon's wisdom and presence, it typically expects obedience from its followers. Debate and dissent waste valuable time that could be spent furthering the dragon's goals.

A mithral dragon intimidates its followers, at a minimum, and some mithrals treat their underlings essentially like slaves. The distinction depends on the dragon's options. If it can find like-minded followers who will work gladly, it recruits them. If not, the mithral is not below using whatever methods of motivation will achieve results.

RELATIONS WITH OTHER DRAGONS

Only a hundred or so mithral dragons are known to live at any given time, and it's hard to find any ties that bind them to one another. Even those who are closely related don't feel any great connection.

Mithral dragons look down on other dragons, especially chromatics and those varieties of metallics that focus most of their time on the collection of treasure. To earn a mithral dragon's respect, a metallic dragon must align its behavior and goals as closely to those of the mithral as possible. A mithral understands the pursuit of an agenda, and respects other metallic dragons that devote their time and resources to a purpose.

KNOWLEDGE OF MITHRAL DRAGONS

ARCANA

DC 16: Mithral dragons receive visions of the future, which they claim come directly from the spirit of the long-dead dragon god Io.

DC 21: Many metallic dragons follow "Io's charge," believing that the dragon god created the dragons to serve as protectors and leaders of weaker creatures. Mithral dragons believe their power of prescience makes them uniquely suited to carry out Io's charge.

HISTORY

DC 16: Events that cause great upheaval sometimes stem from the actions of mithral dragons. Many legends tell of mithral dragons that pursued immense goals and achieved them against all odds. Usually, completing these goals made the world better and more orderly. But sometimes, death and war resulted as side effects of their actions.

RELIGION

DC 16: Mithral dragons frequently join forces with a deity and take on quests with a religious significance. They only do so if they find deities whose goals truly match their own.

DC 21: Any deity might draw mithral dragons as allies, but a few—such as Ioun and Zehir—attract more mithral dragons than others. Mithral dragons hate Tiamat, and many believe Bahamut has failed to live up to Io's legacy.

MITHRAL DISCIPLE MONSTER THEME

A monster theme (introduced in *Dungeon Master's Guide 2*) allows you to modify any monster to reflect the powerful creature it serves. Mithral dragon followers learn to invoke powers of foresight and teleportation similar to those exhibited by their patrons. Add one of the following powers to thematically tie your monsters to mithral dragons. A sample mithral disciple is provided for your use.

Skill Modifications: +2 bonus to Insight and Religion checks.

DIMENSION STRIKE

This power allows a skirmisher to become more potent or gives extra movement and devastating attacks to a soldier or brute.

† **Dimension Strike** (standard; encounter) ♦ **Teleportation**
This creature teleports 5 squares, makes a melee basic attack, teleports 5 squares, and makes a melee basic attack against a different target.

BLINDING LIGHT

This flash of radiance works best for monsters that want to hide, or that deal more damage with combat advantage. Other monsters, especially soldiers, can use the power to strike awe in their foes.

↵ **Blinding Light** (minor; encounter) ♦ **Teleportation**
Close burst 3; level + 3 vs. Reflex; the target is blinded until the end of this creature's next turn. *Effect:* This creature teleports 5 squares.

PROPHETIC DEFENSE

Any monster can make good use of this ability, but it works best for artillery and lurkers that don't already have good escape maneuvers.

† **Prophetic Defense** (immediate interrupt, when this creature is hit by an attack; encounter) ♦ **Teleportation**
This creature gains a +4 bonus to all defenses against the triggering attack. If the attack misses, this creature teleports 3 squares.

DOMAINS

To keep their privacy and peace, mithral dragons build or inhabit lairs in distant areas, primarily in the Astral Sea. They prefer places tied to prophecy or divine magic, and many of the most powerful mithrals dwell in the former realms of dead gods.

SAMPLE DOMAIN: OTRIOR'S BEACON

The adult mithral dragon Otrior maintains a lair within an earthberg in the Astral Sea. Tunnels wind through the massive rock and connect at vast, hollowed-out chambers.

ORRERY

Otrior's Beacon draws its name from the immense orrery that hangs in space over the earthberg on which Otrior's lair is built. The device glows brightly, collecting the ambient light of the Astral Sea and sending it out in intense beams. Otrior's followers created the fantastic device at her bequest. The orrery doesn't represent any physical place, but the motion of time and the interplay of events. Otrior stares at the

Mithral Disciple	Level 11 Soldier (Leader)
Deva Knight-Errant	
Medium immortal humanoid	XP 600
Initiative +7	Senses Perception +8
HP 111; Bloodied 55	
AC 27; Fortitude 24, Reflex 22, Will 22 (+1 to all defenses against bloodied enemies)	
Resist 10 necrotic, 10 radiant	
Speed 5	
⊕ Broadsword (standard; at-will) ♦ Weapon	
+18 vs. AC; 2d10 + 2 damage, and the target is marked until the end of the deva knight-errant's next turn.	
† Rejuvenating Smite (standard; recharges after hitting with a broadsword attack) ♦ Healing, Weapon	
+18 vs. AC; 2d10 + 2 damage, and the deva knight-errant regains hit points equal to half the damage dealt.	
↵ Blinding Light (minor; encounter) ♦ Teleportation	
Close burst 3; +14 vs. Reflex; the target is blinded until the end of the deva knight errant's next turn. <i>Effect:</i> This creature teleports 5 squares.	
↵ Martyr's Cry (standard; recharge Ⓢ) ♦ Implement, Psychic	
Close burst 3; targets enemies; +16 vs. Will; 2d6 + 4 psychic damage, and the target is marked (save ends).	
Inner Radiance ♦ Radiant	
Any attack a deva knight-errant makes can instead deal radiant damage. In addition, a knight-errant can take a -2 penalty to an attack roll to deal 4 extra radiant damage on the attack.	
Health Transfer (minor; encounter) ♦ Healing	
The deva knight-errant takes up to 25 damage, and one ally within 10 squares of it regains the same number of hit points. The knight-errant can then transfer one condition from the ally to itself.	
Memory of a Thousand Lifetimes (free, when the deva knight-errant makes an attack roll, a skill check, or an ability check and dislikes the result; encounter)	
The knight-errant adds 1d6 to the triggering roll.

Equipment plate armor, heavy shield, broadsword, holy symbol	

orrery while meditating to enhance her visions. The beams reflecting from its surface point toward places of importance, but only Otrior can determine where the beams lead.

MEDITATION TOWER

One jutting spire serves as Otrior's place of peace and meditation. Only she or other fliers can reach the summit, so she regards it as a safe outlook. One of the orrery's light beams always shines on this point.

LAIR

Though Otrior spends most of her time within her meditation tower or giving orders and guidance to her followers, she retreats to her lair when she needs to contemplate a matter with no disturbances. This period is usually short—usually only a few days and never more than a couple of weeks—but vital to her decision-making process.

GARDENS

Verdant hanging gardens provide food for Otrior and all of her followers who live on the earthberg. The dragon has a unique diet consisting mostly of vegetables. Like any dragon, she occasionally craves meat. Those who anger her by interfering in her plans might find themselves brought to her domain and served up as a meal.

TUNNELS

The winding tunnels in the earthberg can easily accommodate a creature of Otrior's size, and any that had been too small were widened long ago. Hundreds of caverns, both small and large, branch off from the complex of tunnels. Otrior's servants have created a sustainable society within the earthberg.

CAMPAIGN ROLES FOR OTRIOR

Otrior rarely leaves her ivory tower, so the PCs will need to access the Astral Sea either through their own means or thanks to transport provided by the mithral dragon's servants. The PCs could encounter Otrior on friendly or unfriendly terms. This sidebar refers to the "Dragons in the World" section of *Draconomicon: Metallic Dragons* (pages 42–47).

Patron: Otrior might become a patron as the PCs adventure at higher levels. She's a guiding patron, giving advice while still keeping the full extent of her plans hidden.

Occasional Ally: This campaign role has Otrior popping up from time to time when the beams of astral light shine across the PCs' path.

Scenery: Otrior's Beacon might also work as an interesting locale in your game without having the dragon play much of a role in the events. The PCs might attend a summit of powerful planar leaders at this location, or they might come upon it after Otrior and her followers have abandoned it or been slaughtered by unknown forces.

OTRIOR'S PLANS

Dangerous artifacts and magical effects can wreak havoc with time and endanger the stability of the planes. Otrior's work has given her a deeper understanding of the forces that affect time and the future, and she takes it upon herself to guard what she sees as the correct course of the future. Most of her plans involve gathering lore about time manipulation or attempting to stop others from using magic that might bend the course of time.

The Time Wells: Each plane has a few time wells: places where the normal flow of time doesn't apply and hundreds of possible realities converge. Otrior seeks to find the location of these time wells and hide them from others. This plot can affect PCs of all tiers, depending on where the time wells are located and who searches for them. The PCs might end up playing alternate versions of themselves from other realities or times as the chronological stream warps around them.

The Lost Light: One of the lights from Otrior's orrery shines into an unexplored region she knows nothing about. Paragon or epic characters might sail off on an astral skill to follow the light to its destination. They might find a long-forgotten astral domain, hibernating primordial, immensely powerful artifact, or gateway to the Far Realm. The PCs might wonder if they've just finished a literal self-fulfilling prophecy. Would this place or object have been important in the course of the future if they'd never come to find it?

WORSHIP HALLS

Otrior draws followers from many walks of life. All of them pursue scholarly endeavors, and many are religious. Halls throughout the earthberg allow Otrior's followers to worship almost any god. Gruumsh is a notable exception: Otrior harbors resentment against the destructive deity for reasons unknown.

LIBRARIES

One common element in every mithral dragon lair is some sort of library. These creatures always find use for tomes and scrolls, especially those with prophetic implications. Otrior's Beacon houses eight libraries, each with a tiny window tunnel that runs all the way to the surface of the earthberg. Light from the orrery shines into each library at different times, guiding the mithral dragon's decisions.

About the Author

Red Dragons

The iconic image of the rampaging dragon always breathes fire, and it is not surprising that most creatures associate the color red with danger and warning. Little wonder, then, that when describing these wondrous but undeniably evil beings we often slip into the most flowery and grandiose of language, overusing superlatives that, for lesser creatures, would seem like hyperbole. Be assured that no known language contains a singular word to describe the awesome and terrible power of red dragons.

—*Drakanav Codex*, Chapter 18

Most famous dragons across all the countless inhabited worlds bear red scales, and rightfully so. Although a few individual dragons of other breeds might rise to terrifying or benign prominence in a localized manner or for a few years, no beasts on Golarion or any other world inspire such dread as the magnificently wrathful red dragons. They are, as mentioned in the *Drakanav Codex*, the embodiments of destruction, hate, and supremely justified draconic arrogance. Red dragons frequently suffer from hubris, but while their own narcissistic feelings of arrogant self-assuredness might exceed their obvious draconic majesty, they can actually back up their remarkable claims with claw and flame.

As the most terrifyingly magnificent of all dragons, reds consider all other creatures—with the begrudging exception of the powerful golds—inferiors. When reds hear of their brethren laid low by lesser beings, such as self-proclaimed “dragonslayers,” they offer no sympathies or regrets. Indeed, red dragons scorn their kin for suffering defeat (even if not death) at the hands of their lessers. Some

might mistake this scorn as apathy for the deaths of their fellow reds, if not simply an exploitable disregard for other members of their species. Such suppositions prove remarkably foolish, however, for while red dragons firmly believe that the strong must survive and the weak fall or serve, they recognize that at times luck might allow even the weakest, stupidest, and least-deserving creatures to overcome their betters. That truly exceptional humans might exceed *their own* power simply does not occur to your typical red dragon. Thus, reds shed no tears when their kin fall, but they instead seek out those who exhibited such fortune and ensure that such a thing does not occur a second time. They mock, but then they avenge. Many are the stories of brave dragonslayers who return home bearing the trophies of their kills, only to find their villages, towns, or (in a few rare but notable cases, such as the Razing of Parnthford in 2351 AR) cities brought down around them in a flight of frothing, flaming fury. Cautionary fables insist that mortals leave alone the reds who torment them, but for those foolish enough to risk death and somehow escape with their lives, the tales further beseech such “successful” dragon hunters to go into hiding rather than draw their loved ones into a revenge-fueled bloodbath. Still, dragon hunters continue to seek the hides of red dragons. The Call of the Crimson, as it is known, results in the deaths of at least a score of would-be slayers every year.

Red dragons are magnificent and utterly frightening to behold. Second in size only to golds, and occasionally surpassing even those wonderfully powerful beings, even their scaly eggs are at minimum the size of horses. Terrible and frightening in every describable way, red dragons possess a fierce beauty that exceeds all other dragons. From their powerful jaws, capable of snapping iron bars and the masts of ships, to their muscular tails, which can crash through stone walls as easily as whips can break skin, red dragons reflect murderous perfection and predatory superiority. Superlatives aside, red dragons tend to possess relatively blunt muzzles with strong, thick jaws filled with dagger-like teeth so large they extend beyond the gums, giving red dragons a snaggletooth look that only adds to their fierce splendor. Small nose horns extend up from just behind the tips of their muzzles, and sharp ridges of steel-hard scales follow back along their faces, eventually giving way to numerous scales that grow longer and thicker than the rest, providing red dragons with a characteristic spiky look many intelligent beings find disturbing and fearsome. The bodies of red dragons possess cord-like muscles that allow them to move more quickly and gracefully than creatures of their size should be able to.

ECOLOGY AND SOCIETY

Many tales speak of fearsome dragons haunting mountains (usually volcanoes) and demanding tribute

from the surrounding human lands, and such accounts that speak of red dragons do not paint them in a positive light. Reds are the consummate evil dragons. None of their chromatic kin covet, hate, or lust more than reds, and few prove more challenging to redeem. Villains of the worst kind, red dragons are unflinchingly evil in ways unmatched by any other mortal creatures. Their destructive impulses and hate-filled fiery rampages surprise and delight the most heinous demons and give pause even to the greatest of their gold-scaled rivals. They rampage without concern, completely disregarding the abilities of humanoids who might oppose them and the tales of dragonslayers who somehow stop such magnificent examples of furious destruction.

As the stories surrounding them indicate, red dragons live in massive chambers under mountains. They prefer volcanoes (especially active ones), as such mountains generally stand alone and apart from other high places and dominate the lands around them, but they are satisfied with volcanic lairs in mountain chains. Indeed, King Daralathylx lives within one of the southwestern peaks of the Five Kings Mountains (the exact one is still unknown) rather than the more prominent Droskar’s Crag, for reasons no other being will likely ever know.

In general, younger red dragons damage the ecological webs of their territories more extensively than their older kin. Although they habitually eat less than their larger and older brethren (except when undergoing growth spurts), younger reds patrol their domains more frequently, hunting and killing and destroying as whim strikes them. Older dragons spend less time out of their lairs, and even when they do emerge they rarely concentrate their destructive impulses on their immediate surroundings. Instead, they seem to delight in tormenting more distant human settlements, burning down buildings, dropping peasants from great heights, and demanding coins and other treasures. The lands immediately around lairs of younger red dragons frequently bear obvious scars of fiery destruction, while dragon hunters find difficulty in locating clues pointing to the lairs of older dragons.

Of all dragons, reds possess the greatest appetites—for treasure, food, and destruction. Fortunately for living creatures residing within the territories of red dragons, the powerful fires within their stomachs allow red dragons to consume and digest nearly every non-poisonous substance. These internal supernatural fires are snuffed only when the dragons die, and allow reds to eat nearly any animal, plant, or mineral to gain sustenance.

Every culture bears some variation of the Dragon and the Princess story, wherein a foul dragon demands a beautiful maiden princess as payment to cease his systematic destruction of the kingdom. In various cultures the princess’s part is recast, but she is always a maiden

and always offered as a payment to appease a terrible and frightening dragon. This most iconic of evil draconic traits belongs specifically to red dragons, who frequently exert their dominance over their territories via terrible rampages that can last on and off for entire months but who suddenly stop if offered something of exquisite and irreplaceable value to the suffering people, whether or not the dragons have any use for such a thing—red dragons view their slaves as easily replaceable items of their hoards, and not as thinking, feeling creatures.

While dragons consider humans and elves playthings or replaceable treasures (at best), they do not think so highly of any other non-draconic creatures. They actively despise dwarves (with whom they frequently share their home mountains) and usually attack them on sight and without provocation. Mortals other than humans, elves, and dwarves seem beneath their notice. Red dragons occasionally treat with efreet, but any agreements or deals made with such creatures seldom last longer than a few years. Red dragons are the greatest of all chromatics, and they never fail to remind lesser beings of that fact. Their incredible draconic hubris exerts itself in their every dealing, and reds find utterly preposterous the notion that a creature who is not a gold dragon might be, in even an insignificant way, somehow superior to their own prowess. The mindset of red dragons simply does not allow them to fathom what they consider such a ludicrous idea. In general, they are absolutely correct in this regard, but enough

exceptions exist that overconfident reds do occasionally fall to dragonslayers.

With the exception of the ever-more-powerful golds, red dragons also consider all other dragons beneath themselves. They seldom practice much patience for their lesser kin, and many celebrate whenever metallics die, but red dragons nonetheless extend their blanket of draconic pride to encompass all dragons—dragons are godlike compared to mortal insects, and reds are merely the top of the hierarchy. This pride does not prevent red dragons from mistreating or outright killing other dragons, but it does grant them offense whenever non-dragons take down one of their kin—regardless of age or scale color. Of course, the extent to which they pursue draconic vengeance depends greatly on the type of dragon slain and distance the reds must go in order to exact their revenge—they do not see themselves as the avengers of their race, but they may take action if a known dragonslayer enters their territory.

When dealing alone with gold dragons—even those younger or otherwise weaker than themselves—red dragons put aside their arrogance and act respectfully, at least to a point. Red dragons both hate and admire their gold brethren, as gold dragons alone are, in many cases, more powerful than themselves. The admiration of reds for the power of golds sometimes leads the latter to attempt redemption of the former, usually with poor results. Many creatures, including lesser dragons, fail to understand the significance of the love/hate relationship between golds and reds, and except for draconic historians, few know of the ancient ties between these greatest of all dragon kinds.

The connection between golds and reds began thousands of millennia ago, when the first mortal dragons (all of whom bore metallic scales) hatched under the watchful eyes of Apsu and Tiamat (who at the time bore no names).

Then came the dragon-god Dahak, and with him was birthed treachery. Apsu and his children battled Dahak, but at the moment of their victory Dahak the False Wyrms called out to his mother for aid, and Tiamat promised to those grievously hurt by Dahak to relieve them of their pain if they would rise up against their father and brothers and fight on Dahak's behalf. Most of the dragons flatly refused. The first dragon to acquiesce, a mortally wounded gold whose original name

time has forgotten, later became the first red dragon, who took the name Nerothroc and founded the pure red bloodline. Corrupted by Dahak's betrayal and Tiamat's gift of unholy power, the traitorous golds lost their sheen and became the covetous, hate-filled reds. And in the many long millennia since, they have not yet forgotten nor forgiven Dahak for his treachery, and as a result of what they see as a divine conspiracy, reds remain the least religious of all dragons.

Some red dragons grow so large and powerful, so unbelievably aged and bedecked in breathtaking splendor, that they exceed even the greatest of gold dragons in size and raw destructive strength. These monumentally rare few are truly epic in size and prowess, and the entire history of the world records only a handful of these splendid examples of draconic fury and power. The ability to grow beyond their kind's physical limitations seems to exist only within the pure-blooded clan of Nerothroc. Of the half-dozen reds of this magnificent size known to history, King Daralathylx is one of the greater, but perhaps not the greatest.

HOARD AND HOME

Red dragons covet like no others, and as a result of their greed and their ability to acquire what they seek, red dragons are typically among the wealthiest of dragons. Their immense coin beds can sometimes fill vast chambers larger than most human buildings, and the other treasures they keep put to shame some of the lesser human museums of the world. Red dragons love all forms of treasure, from coins and gems to jewelry and art objects, from masterfully crafted weapons and armor to fantastically powerful magic items and even lesser artifacts.

More than all the shiny trinkets and beds of coins they keep, however, red dragons covet most those treasures that live. Like black dragons, red dragons keep slaves—usually elven or human maidens. Unlike their cousins, however, red dragons do not subject their slaves to intentional torture, disfigurement, and torment. Red dragons prefer their slaves alive and physically (if not emotionally) sound. They consider their slaves delicate treasures to be admired and enjoyed, and when one breaks or loses its beauty, it is discarded (or eaten) and replaced.

As dangerous as red dragons are personally, their lairs often prove at least as lethal to would-be dragonslayers and other foolish trespassers. When they can, most red dragons prefer to live within volcanoes, the intense heat of which provides them comfort. Unfortunately, the maidens red dragons so prize cannot survive within volcanic heat, and thus the dragons must delve, find, or force slaves to excavate comfortable chambers far enough away from the magma cores to allow their slaves to survive in comfort. The lairs of red dragons therefore tend to consist of numerous

chambers connected by long tunnels of lesser size (but always large enough for the dragons to squeeze through, unless they possess other means by which they can reduce their size). When volcanoes are not available or do not suit their needs, for whatever reasons, red dragons live under other mountains. These lairs are characteristically more compact than volcanic homes, but they prove no less dangerous to uninvited guests.

Red dragons protect their lairs with a variety of defensive magics as well as mundane traps and environmental hazards. Those lairs found within active volcanoes always incorporate magma in their defenses. Even those lairs that do not possess molten rock as a natural hazard contain enough traps and magical dissuasions that most aspiring dragonslayers never make it far enough into a red dragon's lair to actually meet the dragon. Concealed pits, deadfalls, entire hallways filled with a succession of various traps and warded with *antimagic fields*, secret doors, mindless guardians (especially gelatinous cubes), magical *symbols*, *alarm*, and *guards and wards* all make red dragon lairs unpleasant places to invade. Worst of all, though, is that those trespassers who penetrate far enough into a red dragon's lair must face the most lethal defensive measure of all—the dragon itself.

The dragons keep their slaves in side chambers with doors operable only from the outside (and usually possessing impressive arrays of concealment magic, mundane traps, and other forms of dissuasion). The rooms in which red dragons keep their harems are filled with comforts the young women cannot hope to find outside, but they remain nothing more than luxurious prisons. Red dragons hide their slaves so well that many dragonslayers never suspect such hidden chambers even exist, leaving behind sometimes dozens of forgotten young men and women who slowly starve to death within their comfortable prisons.

CAMPAIGN ROLE

Red dragons epitomize evil dragonkind. They are furious destroyers and immoral deceivers. They lie, they cheat, and they kill. Depending on the needs they fill, red dragons can act as near-mindless rampaging destroyers, leveling small towns or whole districts of cities with fire and claw and magic, or they can serve as careful masterminds, hatching terrible plots of vengeance and greed.

As mentioned elsewhere, red dragons are what people think of when they hear the term "dragon." They breathe fire, kidnap maidens, and raze human settlements. Despite their undeniably glorious power and destructive potentials, red dragons are not all-powerful. They make mistakes. On rare occasions, they even lose battles against mortal beings. These failures remain extremely rare, however, and most aspiring dragonslayers will face

the same red dragon multiple times before any sort of climactic, final battle occurs. Although red dragons are not cowards, they do possess an extremely developed sense of survival, and they only battle to the death in their homes (and not always then). In other words, even if they for some reason do not present much of a challenge to defeat, red dragons should prove frustratingly difficult to kill.

ON GOLARION

Red dragons garner a great deal of attention. Their brilliant scales and powerful tempers make them easy to spot, and the destruction wrought by younger reds while hunting or exerting their control over their territories gives those who hate and hunt dragons ample opportunity to locate them. Providing proper due to the fame of red dragons throughout the years would fill a hundred pages, but several of the notable red dragons considered active on Golarion are summarized below.

On the Isle of Kortos, in areas not entirely controlled by Absalom, a few young red dragons (as well as a handful of blues) vie for control. Although Absalom has considered sending dragon hunters to the area, for the most part its leaders remain content to wait and allow the dragons to kill off one another. For more information, see *Guide to Absalom*.

Since 4569 AR, the mysterious Glarataxus has plagued Korvosa and her holdings, appearing for several months at a time to torment and destroy before retiring to his still-unknown lair to rest for several decades. Attempts to appease Glarataxus continue to fail, as calls for him to negotiate continue to fail. It was recently revealed by the brass dragon Thehydrax that Glarataxus is likely deaf, so Korvosa readies for his next return with large slate tablets and oversized sticks of chalk. For more information, see *Guide to Korvosa*.

The dragon Asuulek torments Osirion from his volcanic home. Attempts to infiltrate his known lair so far have all met with failure, with only one survivor among the dozens of glory-seeking dragon hunters returning to report on the lair's seemingly impassable defenses. For more information, seen *Pathfinder Companion: Osirion, Land of the Pharaohs*.

Of course, no description of red dragons on Golarion would be complete without mention of the magnificent King Daralathylx, who ostensibly rules the Five Kings Mountains. His majestic and near-unfathomable power requires its own tome to give him just dues.

NAMES

Many red dragon names incorporate the phrases “dara” or “thys,” which mean “terrible” and “great,” respectively. Other than this simple convention, red dragon names vary greatly but many of them are overly long, complicated, and difficult to pronounce. As reds age, they tend to add to their names, dropping off syllables to add new ones, and

slowly growing out their monikers to ridiculous lengths. Truly powerful and magnificent reds, such as the King, sometimes reverse this tendency in their later years, reducing the complexity of their names to something easily remembered and feared for centuries to come.

Red dragon names: Akdarathys, Drathyskith, Kratharak, Sykaralyn, Varantulian

DARALATHYXL

Lairing in the northwest corner of Andoran, somewhere northeast of Droskar's Crag, is one of the largest, oldest, and most powerful dragons in all of Golarion. Many call Daralathylx the Sixth King of the Five Kings Mountains, and those who meet him are advised to address him at least as “king,” although he seems to prefer “emperor” or “god.” His influence extends for hundreds of miles, and at least a dozen other powerful chromatic dragons live within his vast territory.

Scholars both draconic and mortal estimate his age in excess of 2 millennia, and although the frequency of his appearances decreases with each passing century, only fools openly speculate that he is weakening in his advancing age. Indeed, too many whispers of his death, departure, or infirmity seem to summon his wrath, and thus the long-suffering people of Darkmoon Vale and other areas near Droskar's Crag speak of the king only in quietly reverent terms, hoping their respect continues to hold him at bay.

When he does stir, Daralathylx spreads terror across northwestern Andoran, southern Isgar, and southwestern Druma. He demands supplication in the form of coin, treasure, and maidens (elves are his preference). Those communities that do not placate his rage quickly enough find themselves engulfed in flame, their towns set to ruins, and their cities weakened. When Daralathylx stirs, death follows.

For more information, see *Guide to Darkmoon Vale*.

TACTICS

Before Combat Daralathylx seldom faces a creature foolish enough to willingly fight him, but nonetheless the king remains a careful combatant. Every day he casts *detect scrying* and *moment of prescience*. If he suspects a battle is imminent, he casts *bull's strength*, *cat's grace*, *eagle's splendor*, *foresight*, *fox's cunning*, *greater arcane sight*, *mass bear's endurance*, *owl's wisdom*, *protection from energy* (acid, cold, electricity, and sonic), *protection from good*, *protection from law*, *protection from spells*, *spell turning*, and *stoneskin*.

During Combat Daralathylx attempts to end battles quickly and decisively. He casts *time stop* to give himself extra actions. When even these tactics cannot dissuade would-be dragonslayers from leaving him be, he alternates using his breath weapon with making full attacks. Once he views his foes and sees what kinds of spells they prefer, he casts *spell immunity* on himself at his first opportunity.

Morale Outside of his lair, Daralathylx takes no risks with his own life. If reduced to below 700 hit points, he casts *time stop* and then usually two *heal* spells and whatever other defensive spells he has time for. Once he returns to combat, he battles again until reduced to 700 hit points, continuing this cycle until he has only one 9th-level or one 5th-level spell remaining, at which time he casts *greater teleport* and returns to his lair. Inside his lair, itself a deadly maze impervious to scrying, he waits and licks his wounds.

Base Statistics Without his

defensive and divination spells, Daralathylx's

The Ecology of the Red Dragon

The color of blood and fire

The slender, middle-aged man considered the question for a moment, then pulled a map from a drawer and unfolded it on top of his desk. Placing bric-a-brac on the corners, he glanced from it to the young men who faced him in his study.

"You're sure that you want to hunt down a dragon?" he asked quietly. "Isn't there something smaller and less offensive you could go after, then work your way up?" He jabbed a finger down at a wooded area on the map. "Now, here is reputed to be the lair of a wondrous sort of being known as a cyclopskin. Much less impressive than a dragon, to be sure, but not as deadly. This cyclopskin—"

The brawny youth who seemed to be the leader placed a hand on his sword. "You calling me a coward, Nimodes?" he asked.

The sage hesitated and sighed, but he never looked up. He adjusted his spectacles. "Well, if it must be a dragon. . ." He bent over the map. "Now, there are three dragons known to have lairs within two months' march of here. . ."

A gangling youth moaned. "Two months! Haven't you got anything closer?"

"Sorry," Nimodes said, though truly he didn't sound sorry. "You take a dragon where it lies. Dragons are so voracious that they cover wide areas for their hunt-

ing grounds. When you're dealing with the big dragons, this range encompasses entire kingdoms as their own territories, so they never run out of food or loot. A wizard I know who lectures on the ecologies of various monsters says that dragons have no ecology: They ravage it. Now, if you want to meet some great wizard and have him bring a dragon to you, I can arrange for that. I'm merely a hedge wizard and a scholar, but I have some friends who could do this. Of course, it will cost you much. . ."

After a short silence, the sage coughed and pointed to the map, to a range of mountains surrounded by forest. "Here is the nearest true dragon, in an ice cave atop the highest summit around. His human name is Frostbite, a friend to elf and dwarf. He is huge and of the silver breed. He hoards only knowledge, and this is the treasure that most seek from him."

"I think that one would not be worth the trouble." The brawny leader said casually. He had lost interest after hearing the words "hoards only knowledge." The sage noted this and dropped his gaze back to the map. It was as he'd expected.

"The second dragon is probably not worth it, either," he said, "as she is employed by the City-State of Helsford as a guardian, and even has a rank in the army

there. She is Frostbite's daughter. Here, then. Look over on the other end of this range, where another sort of dragon makes his lair. Pyre is his name, a red dragon. If I recall the passage correctly, *The Lorebook of Aramar* writes of him:

"Red blood his color and delight,
Red flame his breath that burns the
night,
Long scimitars he has for claws,
A fang-ringed cavern 'twixt his jaws,
Red armored is this deadly Pyre,
Who stole our gold to stoke his fire;
A hundred men sought out his lair —
Not one did Pyre the dragon spare."

At the mention of gold, the youths smiled and nudged one another. They didn't seem at all bothered by the last two lines — except, noted Nimodes, for one youth in the rear, who had an intense, bookish look about him. The sage briefly wondered if the youths had some powerful talisman or magical weapon that gave them such confidence. He immediately rejected the idea. They had nothing but youth and enthusiasm — and a fatal naivete. Nimodes vaguely recognized most of them as being of farming families. Nothing wrong with that, but challenging a red dragon wasn't in their league. Damn those lying adventurers, he thought, who had passed through the region last month. Loose talk about mounds of gold and easy victories had obviously borne results that he should have foreseen. These boys were going to die.

The brawny youth grinned widely. "Pyre. That sounds like the dragon for us. What can you tell us of it?"

"Him. A point in your favor." A worthless one, Nimodes added mentally. "Of the red dragons, it is the female which is the most dangerous, for she is less likely to bargain or surrender under duress." This does not mean that males are weak. The city that sent the small army after the gold was burned to the ground shortly thereafter. Only a handful of the residents survived the firestorm. That was two hundred years ago; since dragons grow throughout their lifespans, Pyre is all the mightier now — though perhaps weaker, too, as he is at least six centuries old.² He may be even older."

Much of the grinning ceased, but the youths did their best to look only mildly concerned at the news. The one youth in the rear who seemed to have doubts before now appeared concerned but very thoughtful. For some reason, Nimodes was pleased to see it.

"Oh, to be sure," Nimodes said smoothly, "the red dragon has its weaknesses. Pyre is old and getting to be slow, despite his incredible power. Sadly, his age has not diminished his might once he brings it to bear. He may yet have other vulnerabilities peculiar to him, if legends are to be believed."

"What sort of vulnerabilities?" It was the

youth in the back of the group. Nimodes noted from the boy's clothing that he was probably from one of the towns near the Greenwich River. The sage smiled. He had hated to think that the brawny lad was the brains of the group. Maybe the boys had a chance of surviving an encounter with Pyre, if not being talked out of it altogether in time. He certainly had no hope that they'd defeat the monster itself.

"Dragons, particularly the older ones, sleep a great deal — rather like house cats, I suppose." Nimodes sat back, looking past the group as he thought. "It is during sleep that older dragons are especially vulnerable, but only if their senses are on the wane. Their sleep is very deep, and they dream a tremendous amount, but dragons rarely speak of their dreams. Some say that dragons do not dream so much as they remember in full detail earlier experiences in their lives, rather like elves. Some texts say that they experience past lives in these slumbers, which accounts for a slight disorientation when they awaken." A dragon may sleep for extremely long periods of time, even hundreds of days. Sadly, awakening from such a long sleep leaves a dragon in a great hunger. When it awakens, it yearns to lay waste to its surroundings."

"You said something about vulnerabilities that were Pyre's alone," reminded the youth in the back.

Nimodes blinked. "Hmm. Yes. Well, during Pyre's attack upon Valesburgh two hundred years past, he was said to have lost an eye to a machine-hurled bolt. A survivor of the battle saw the dragon bleeding from his head, roaring as he clutched his right eye with a foreclaw. Pyre is now many hundreds of years old, and even a dragon's senses won't improve forever. He might be blind now."

The youths grinned at the news.

"Another weakness of the red dragon is its greed," Nimodes continued. "A red dragon seeks gold above all other things in life, for gold gives it status among other red dragons. The male red dragon's second great love is to eat, the third is to sleep.' But a love of gold will drive a male red dragon to any lengths. That focus has been used to their disadvantage in traps and trickery against them on a few occasions, though a vengeful red dragon is the worst of enemies. It is best to kill them swiftly rather than to tease or bargain with them; they are too dangerous."

The scholarly looking youth spoke up again. "I have heard that some dragons somehow resist spells."

Nimodes instantly placed the boy. Rumor said a river-town wizard had recently turned his apprentice loose. "True enough. Some are indeed able to throw off spells, but they cannot negate the existence of magic itself. They are merely tougher than we are, and they are partly magical in nature. Speaking of which, you should know that some dragons have gained from their parents knowledge of spell-casting.

Dragons that were abandoned at birth cannot even speak, much less cast spells, but they are rare ones in these lands. Pyre is the hatchling of Infernal, a female dragon who would not accept that any offspring of hers would be anything less than a menace to civilization. It is known that Pyre favors fire-based spells — ah, I had forgotten to say, yes, Pyre is a spell-caster, and he was very good at it, too. I cannot say how good he is at present; he has not been seen in some time. Pyre is said in legend to rejoice in the casting of fiery spells, always in the service of destruction."

"Magic is of little consequence to cold steel," sneered the brawny youth as he drew his blade to brandish it. Nimodes noticed that he held his blade in the manner of a club. A few rust splotches marred the steel, and there were notches along its length. Not a magical sword, though one that had seen quite a bit of use in its long-ago day. Nimodes resolved to talk to the apprentice later, privately if possible; it was a shame to throw away talent.

"Pyre uses magic, yes, and he breathes a cone of flame. His senses are exceptionally acute. Should he taste your blood, he can track you by scent to the ends of the world.⁵ His bite is powerful, his claws can hold a target fast, and his cone of fire can cleanse all remains away. Pyre is quite capable of melting away even . . . ah, nevermind. I know — fire is of little consequence to cold steel." Nimodes wished he could smile, but it was too painful.

The apprentice spoke up again. "Do your books mention any of Pyre's habits or traits that could be exploited?" At a bored look from the leader, he added, "No point in spending more time than we have to."

Nimodes nodded, pleased. "All red dragons share certain traits with the common house cat. They play with their food, like to sleep near a heat source, bury their wastes, and hate getting wet. Pyre, as with some of his kind, likes to talk with his food, meaning those who are unfortunate enough to be captured by him. One text of mine claims that Pyre is fond of riddles and jokes. To win a riddling contest with Pyre, he must be unable to guess the answer of one of yours while you must answer all three of his. It is unlikely, should Pyre gain the upper hand, that all his prisoners would escape. Perhaps one in ten could bargain his way out. Indeed, Pyre has a unique single trait which irritates others of his own kind: a fondness for puns. The worse the pun, the better Pyre likes it. A jester named Ferred the Moor once managed to get three adventurers out with a single pun. Of course, Ferred was legendary among jesters across this whole—"

"This is getting boring," interrupted the brawny youth. "We don't plan to let the dragon get the upper hand. Since you've been paid for information, make it useful. Where can we strike the most telling damage?"

The sage looked up into the leader's eyes, stared hard at him, then turned away. "As you wish. If you have the chance and can strike there, hit the eyes. A direct hit upon the eyes will cause any dragon to draw back. If the blow doesn't go deep, the dragon will go berserk and scour the area with flames and claw. It is told that the red dragon Firetongue was struck so, and only one returned to tell the tale. That one escaped when the enraged dragon brought the cavern down on her attackers and herself. Any dragon fears the loss of its senses. Blindness is the worst fate that a dragon could imagine, worse even than the loss of its wings and limbs. A blind dragon is at the mercy of all other creatures, vulnerable when it was once all-powerful; it cannot bear it."

"As for exploitable fears, Pyre has none that anyone knows about. Perhaps he has only the one common to all dragons — fear for his own life. Dragons are cowards at heart . . . but you must be very strong to bring this fear out." I mustn't encourage them, Nimodes thought. "Fear, however, will certainly be your problem."

"And why is that, mighty wizard?" sneered the leader.

Nimodes just looked back, refusing to be baited. "Most dragons project fear itself as an effect of having a magical metabolism. This is the dragonaura, a literal cloud of terror which surrounds the dragon when it wants to show itself in its glory. Some with special training, such as knights and paladins, can throw off this effect, and certain magical protections can also negate this terror-cloud."

"Yet even the dragonaura is pathetic compared to the most valuable and critical trait of dragons like Pyre — their cleverness, pure and simple. Pyre has lived a long and full life, and has learned every trick in the book. His lair will be filled with traps and perils, ready to be unleashed at a moment's notice.' A red dragon on the southern coast once located casks of alcohol so that they could be shattered with a swipe of his tail, sending alcohol down onto his cavern floor. One breath would have ignited the whole cavern in a fiery blast that would not have harmed the dragon greatly. He was a clever dragon."

"What happened to him?" asked the youth in the back.

Nimodes smiled and glanced at something on his wall. "Oh, the dragon ran into adventurers more clever than he."

The apprentice cleared his throat. "What can you tell us about what a red dragon eats and drinks?"

"Nothing that can be poisoned in a way that will affect the dragon, except perhaps in centuries. The red eats what it can catch and kill." As for drink, alcohol is its preference, though it will never become drunk. Water is taken in small doses, as living prey is moist enough for its needs. A dragon need not eat or drink during the time it sleeps, regardless of the time

involved, and it suffers little even from a loss of fresh air while asleep. One red dragon was buried by a rock and mud slide while asleep, only to awaken and dig its way out later in the year. When it does eat, the red dragon can consume twice its body weight before dragging itself off to digest the meal."

"And where will its greatest treasures be?" asked the brawny youth loudly, not liking to be left out of the conversation.

"Now, that depends on what you mean by treasures," said the sage. "Coins, of course, make up a red dragon's bed. Gems and other precious materials will be placed around its lair in highly visible locations, pleasing to the eye. Unlike the silver, the red dragon collects little art. Unlike the gold, it rarely shows a preference for gems, which the gold dragon eats. Unlike the vain brass, the red does not usually surround itself with reflective surfaces. Items used only by men, such as magical armor, are often placed at the back of the lair, to draw attackers in with their own greed. Knowing greed as well as a dragon does, it is no wonder it can use the same to trap its prey.

"Magical items are separated from their owners before the latter are devoured, and these items will most likely be in a side cave. These are trophies of the kill, and they are watched over and counted almost continuously. With red dragons, one faces the possibility that a hollow has been dug into the rock, the treasures placed within, and other rocks forced into place with the dragon's massive strength."

Nimodes sighed. "And that is all I know to tell you. If you have more money, I could research the topic in the library at the Castle Mardelaine, where—"

The leader cut him off. "That's enough, old man," he said with a wave of his hand. "We have what we need. Good day." He turned and forced his way through the group of youths around him, and they followed after him, muttering strategies among themselves. Nimodes watched them go, wondering if he should stop them. They were fools who had as much chance of killing Pyre with those swords and farm implements as they would with snowballs. He thought, then slowly released his grip on the arms of his chair. No, they would never listen. So be it. It was a waste.

Then he noticed the apprentice, who had stayed behind. The boy was staring at the object on the wall at which Nimodes had glanced earlier. "A trophy of sorts?" said the youth with interest.

A jagged yellow tooth was in a bottle on the shelf. A full five hands long, it came to a sharp carnivore's point. Nimodes looked at it and smiled faintly. "A relic of my adventuresome youth."

The apprentice laughed then. "Perhaps I'll bring you another — not now, but in time. I sense that I should study this adventure before us a while longer before we set out. If the others leave without me — well..." The boy sighed and shrugged.

"I wish them well, and they will be missed. But I want to do this right the first time. Good day, Nimodes, and my thanks."

Staring at the closed door a moment later, Nimodes was lost in thought. He had a feeling he would indeed see the apprentice again. He knew it in his bones.

Footnotes

1. Female red dragons, at the DM's option, may be harder to subdue than male ones. When attacking to subdue, take one and a half times the female dragon's hit-point total to calculate her effective hit-point value for subdual purposes. Thus, a 44-hp female red dragon effectively has 66 hp for purposes of subdual combat; if 33 hp subdual damage is inflicted on her, there is only a 50% chance that she will be subdued. Double her hit-point total for subdual purposes if the female red dragon is defending her young or eggs. Female red dragons will not listen to bribery, though flattery may impress them.

2. Like many dragons, red dragons shed their skins as they pass into each new life stage. Red dragons eat their old scaled skins, so as to gain certain nutrients from them. A very young red dragon is about 6' long; between its fifth and sixth years, it grows to 12', then gains another 12' in length for every stage of life thereafter. Thus, an adult red dragon is 48' long. The size differences of "small," "average," and "huge" refer to the dragon's body mass; a small dragon is thin and wirey, and a huge dragon is thick-bodied, muscular, or fat, with length remaining constant for all body types.

Red dragons of particularly advanced age (600 years old or more) suffer debilitating effects from their age. Their chances of sleeping increase by 10% per decade thereafter, with additional reductions of 1/2" per decade in the range of their ability to *detect hidden or invisible creatures*, and of 5' per decade in the range of their infravision. Dragons that are 700 years old or more have a 95% chance to be found sleeping, and have infravision to a range of 10'; they cannot *detect hidden or invisible creatures* except

within a range of 3". Their chances of death per decade after their 700th year are 5% per decade, cumulatively. Dragons that can cast spells suffer a 5% spell-failure penalty for every decade of age past their 600th year, to a 95% spell-failure maximum. For a few weeks prior to its death, a red dragon may become senile and insane, and is especially dangerous as it becomes so unpredictable.

3. Dragons of ancient age are disoriented when awakened from sleep. Allow a loss of initiative when appropriate for their response to an attack or confrontation if suddenly awakened. A dragon older than 600 years loses initiative for the round following its awakening and makes no attacks in the round it was awakened.

4. Female red dragons differ from males in their preferences. Females like to fight, first and foremost, and especially love to fight females of their own kind. They are even more territorial than males and less tolerant of other species. A male might be bribed to look the other way while a "morsel" escapes, while a female will take bribe and briber both. The female is also the aggressor in mating. It has happened that when young dragons leave their nest, the female becomes temporarily insane and slays the male. She then devours her former mate and any of the hatchlings which return. After fighting comes an interest in food, then in gold and treasures, the female liking reflective surfaces. Female red dragons have only a 15% chance to be caught sleeping.

5. A red dragon that has tasted someone's blood can track that person as can a ranger of a level equal to the dragon's age stage, using the information in *Unearthed Arcana*, page 21. Thus an adult red dragon has a 60% chance of tracking a wounded victim. Using smell, sight, and hearing alone, the dragon has one-half this chance of tracking someone that it has previously detected but not wounded.

6. Dragons value their sense of sight highly, even above their senses of smell and hearing. A blind dragon makes all attacks at -4 to hit and will retreat whenever possible from determined opposition.

Phoenix Command is a trademark of Leading Edge Games. Copyright 1988 Leading Edge Games.

If cornered, the dragon snaps at every sound and scent, but may be more than willing to bargain or plead for its life. Dragons without senses of smell or hearing are not affected in this manner. Dragons may be struck in their eyes only if attacked while sleeping. There is a 10% chance per level of the attacker that a blow aimed at a dragon's eyes will drive into the most sensitive part and not be turned aside by the tough eyelids (this chance rises to 20% per level of the attacker if he is a fighter or cavalier, or one of the subclasses thereof). At least 8 hp damage must be done to permanently blind the dragon in one eye; otherwise, the dragon is blinded for only 2-5 rounds, then has a -2 to hit for 5-10 days thereafter, then sees and fights normally.

7. Some dragons, notably the green, red, bronze, and white, swallow small stones and bits of metal which go into a small second stomach. This is similar to the gizzard of a bird, needed because these dragons are unable to chew food. These coins and other bric-a-brac aid digestion and are eventually left in waste products. Many dragon breeds, particularly the fastidious red, bury these wastes outside their lairs. Red dragon wastes, in addition to including small bits of metal, contain large amounts of sulfur and potassium nitrate. Thus, a sharp odor is a clue to the location of such a burial spot. To the surprise of many, the presence of sparks or fire, whether from a shovel striking a rock or from a dragon's fiery breath, causes these sites to suddenly explode with tremendous violence. Red dragons have used this physical property of their wastes as a secret weapon; they lure a group of attackers to either dig into a waste-pit or stand over it as the dragon breathes upon the ground. The explosion produced, as a rule of thumb, does half as many hit points of damage as the dragon's own normal hit points, or one-quarter of this amount if a saving throw vs. breath weapon is made. The radius of effect equals the dragon's hit points expressed in feet. Red dragons, given their tough hides and resistance to fire, take only one-quarter or one-eighth damage, depending on their saving throws if they are within the area of effect.

8. Since dragons are reluctant to discuss their dietary habits (beyond their threats to eat those who inquire into such matters), little information is available to PCs on this topic. Red dragons are, as everyone knows, carnivorous. Also, thanks to their magical metabolism, red dragons can go for prolonged periods without actually eating (this is how they can sleep for durations of 5-500 days). If awakened after a sleep lasting at least 30 days, a red dragon will do anything to get food before performing most other actions. Red dragons have a +4 bonus to their saving throws vs. poison and take only half damage from it (or lose half their normal hit-point maximum if a failure to save means death). Ω

SAGE ADVICE

by Skip Williams

If you have any questions on the games produced by TSR, Inc., write to:

Sage Advice
c/o DRAGON® Magazine
TSR, Inc.
P.O. Box 110
Lake Geneva WI 53147

We return to the D&D® game system in this column, with bits of advice for D&D® game players and Dungeon Masters. Page references are for the most recent editions of the various rule books — 1983 and later unless specified otherwise.

Campaigns

What do you think of house rules?

House rules are fine — sometimes.

House rules are rotten at other times.

Here are some of the key rules about house rules:

1. Make sure they are really necessary.
2. Make sure everybody knows about them ahead of time.
3. Enforce them consistently. They should be written down and used just like the published rules.
4. Change them promptly when they don't work out.
5. Remember that your house rules go only with your "house." Don't assume that they are in effect when you play in another game, and never give another DM a hard time about not using them. No set of house rules is better than the published rules or another DM's house rules — they're just different.

My friends and I are starting in a new D&D® game campaign, but the only characters we have are from an old AD&D® game campaign. Can we just transfer these characters to the new campaign?

We don't recommend transferring AD&D® game characters to the D&D® game; create new D&D® game characters instead. The two game systems involved are only superficially alike.

Is it okay for a player to have more than one character in a campaign?

Many players have more than one character in a given campaign. This allows a choice of characters for any particular adventure, and it insures that the player has a character to play if one of his char-

acters gets involved in a prolonged adventure or project. Some DMs allow players to play more than one character at a time, but we recommend this when only a few people are playing; otherwise, it becomes too complicated to manage.

Characters

Is it possible for demi-humans to follow other classes after they have reached their maximum level? The notes in the demi-human section of the Companion Set *Players Companion* (page 29) seem to indicate that this is so.

Demi-humans never follow other classes. The notes that have you confused refer to the increased fighting abilities that demi-humans can gain after they have reached maximum level.

What are the "attack ranks" (A-M) noted in the *Players Companion*, pages 30-31?

"Attack Rank" refers to the column of the combat chart that the character may use. This allows demi-humans with extra experience to fight almost as well as fighters. The small letters (a-d) refer to other special abilities that demi-humans can get after reaching maximum level. These special abilities include multiple attacks per melee round and the other fighter combat options (*Players Companion*, page 18), and resistance to various attack forms. A careful rereading of the demi-humans section (*Players Companion*, pages 29-31) should clear up your confusion.

How long does lycanthropy take to set in? Can it be cured? Can a player character who is turned into a lycanthrope continue play?

Lycanthropy has an onset time of 2-24 (2d12) days, and until that time this magical disease is curable by a cleric of 11th or higher level. Once the change occurs, however, the afflicted character becomes a DM-controlled monster.

What happens when a cleric turns undead? Does the turning have a duration?

The undead run away from the cleric for one turn, then avoid the cleric for a full day, unless the cleric attacks them.

Other than for weapon mastery, what good are experience points

Silver Dragons

Silver dragons epitomize all that is good and holy in the spheres. Even more than treasure, they crave guidance and law. They live by rules placed upon them by trusted allies because they hunger for absolutes. Some humans mistakenly call silver dragons the paladins of dragons, but doing so ignores the very fact that silver dragons existed long before paladins and follow codes more limiting than humans can fathom. Silver dragons are not the paladins of their race; paladins are the pale imitators of silver dragons.

—*Drakanav Codex*, Chapter 19

Often called the paladins of dragons, silvers embody the loftiest ideals, such as justice, honor, valor, and mercy. Silver dragons do not hesitate to strike down irredeemable evil, nor do they fail to stay their magnificently lethal claws when foes beg for clemency. As beacons of virtue and gifted with the courage of righteousness, silver dragons draw others around them in times of war. In the long history of conflict between the metallics and chromatics, silvers form the vanguard and backbone of the metallic armies. Silver dragons fight with honor and grace, never reluctant to enter battle to uphold the tenets of goodliness or law.

From the moment of their hatching, silver dragons are keenly aware of what the world expects of them. They must remain ever courageous, even in the face of death. They cannot act dishonorably, for doing so shames not only them but their entire kind. At every opportunity they must obey draconic law and that of the lands in which they find themselves, and strive to ensure that others do so as well. The Powers That Be expect them to punish those who

willfully break laws or otherwise act against the common good, but in a way both merciful and just. All this they know instinctively, and it is a testament to the supreme power of their convictions that they not only accept the heavy weight of responsibility placed upon them by Apsu and the universal concepts of Good and Law, but frequently push for even loftier duties.

Sleek and beautiful, silver dragons shine like mirrors, reflecting the sun from their silvery white scales and acting as actual beacons of light when all else is dark. This minor glow makes them easy to find on a battlefield and gives their allies a landmark around which they can rally. That it tends to draw the strongest foes also plays into the honorable nobility of silvers, as they prefer to battle the foulest evils personally. Like the metal with which they are frequently compared, however, the shining scales of silver dragons dull easily, losing their luster and turning a pallid gray. This dulling typically reflects the state of the silver's soul, and thus those who begin to lose their sheen are gently advised by their comrades to "polish their scales" (a polite way of suggesting they speak with someone in order to refresh and refocus their minds and spirits).

ECOLOGY AND SOCIETY

Silver dragons are an anomaly among dragons and unusual even among the varied creatures of the wide multiverse. Unlike their draconic kin (even their esteemed gold cousins), silver dragons rarely demonstrate selfishness, envy, or greed. As true paragons of virtue and natural proponents of goodness, justice, and honor, silver dragons act in accordance with the loftiest chivalric codes. Their altruism occurs naturally, and their sense of duty comes to them as a divine spark while still within their eggs.

Upon hatching, silver dragons are presented with numerous codes of conduct, regulations, and oaths of service, only some of which they must agree to in their youth. As they age, silvers adopt ever-more-restrictive codes that increasingly limit their behaviors. By the time they grow into great wyrms, the lives of silver dragons are excruciatingly regulated and controlled by external agreements with powers greater than themselves, such as Apsu himself, councils of gold dragons, or other committees or divine agents that silver dragons as a race acknowledge. These agreements extend into every aspect of silver dragon life, such that certain natural acts (procreation being the major example) become so carefully ritualized that the oldest silver dragons do not bother with such things (and thus most silver dragons mate several times before they advance into their older years). The copper dragon Hylyax famously joked that the greatest of silver dragons must conduct rituals in order to eliminate wastes properly, but when he later found out the truth

of his words, he successfully petitioned a council of gold dragons to remove such preposterous limitations.

While most creatures balk at such control, even those that typically favor order and regulation, silver dragons seem not only to enjoy it, but to require it. The controls laid upon silver dragon behavior by the divine agents of good and their own natural instincts are designed to increasingly regulate them as they age, but many young silver dragons gladly adopt codes of conducts meant for older dragons.

Many creatures, especially brass and copper dragons, do not understand the mindset of silver dragons and cannot fathom why they willingly agree to such strictures. Conspiracy theorists whisper that silver dragons must be the most weak-willed of all dragons, and that the goodly powers place these constantly upgraded restrictions in order for the silvers to retain their veneers of goodness. What few creatures understand is that silver dragons actively ask for such codes of conduct, and the many restrictions placed on silver dragons by their betters originate in the minds of silver dragons themselves. They find regulation comforting and ritualized behavior pleases them. Beginning with Argix, the first of her kind, silver dragons have long petitioned Apsu and the other gods of goodness and law to create increasingly stringent rules for silver dragons to follow.

Obedying these many rules and regulations, pressed upon them by divine agents but requested by the dragons themselves, grants silver dragons their one and greatest nod to their draconic heritage. Following the rules fills silver dragons with a dominating pride best described as draconic hubris. Not even self-loving red dragons exhibit the levels of pride shown by silver dragons. This exacting living and unequaled righteousness has its darker side, of course, but the best mentors know to carefully humble silver dragons and expunge such behaviors from their charges.

Not surprisingly, given their title as paladins of dragons, silvers are among the most religiously inclined of all true dragons. Those who do live piously almost universally worship Apsu, the father dragon, although an increasing number bend their powerful knees to the human deity Iomedae, goddess of paladins. Draconic paladins of Apsu go where their god-king sends them, and most communicate directly with Apsu several times in their lives. These silver dragons travel not only across Golarion but throughout the entirety of the spheres, supporting angels, celestials, and other eternal champions of righteousness and holiness. In their battles against evil, these draconic paladins give hope to those who might otherwise fail in the face of relentless malevolence. The long annals of history recording battles between celestials and fiends occasionally mention the turning of battle with the arrival of a silver dragon "gleaming like the sun in the darkest pits and casting

light across those who fear its cleansing nature.” Draconic servants of Iomedae concern themselves more with the threats immediately facing Golarion and its people, and as a result most Iomedae silver dragons live in Mendev, where they frequently clash with the demons spawned in the Worldwound. Mendevian silvers meet almost monthly, always with a human paladin they all consider an ally who serves as leader of the gathering. During these meetings, the silvers coordinate their efforts (usually in terms of delegating duties and responsibilities so there is no overlap) and report to the meeting’s leader their previous successes and setbacks. Sadly, with nearly every meeting, the number of dragons in attendance continues to shrink—and not from desertion or lack of interest.

Silver dragons prefer magic that bolsters themselves and their allies. Once they boost their side in this way, the silvers focus on magics that weaken or otherwise inconvenience their foes. While the school of abjuration encompasses most of these kinds of spells, silvers rarely focus their learning specifically on that school, instead incorporating transmutation, conjuration, and even divination spells into their repertoire—whatever can increase their effectiveness in battle.

Many draconic scholars consider silver dragons the least sane and mentally stable of the metallics, pointing to their insufferable pride and reliance on their mentors as weaknesses. Silver dragons, and even most other metallic dragons, counter this argument by pointing out the responsibilities placed upon silvers from their very hatchings. Not even the sagely and powerful gold dragons shoulder such weighty duties, and in tones of admiration the golds often point out that their silver kin not only willfully accept such responsibilities but actually seek out ever-greater challenges. Thus, silver dragons who can rely upon the careful and concerned guidance of

gold dragons or other powerful goodly creatures remain among the most virtuous and unwavering proponents of morality, justice, and mercy. Only those cast adrift in the world are liable lose their way over time.

Silver dragons rarely live alone. They seem to prefer the company of gold dragons, celestials, and other creatures dedicated to the fight for justice, fairness, and order. As a mark of their draconic selfishness, though, silver dragons see other silvers more as rivals than allies, and they tend only to come together in order to breed or when the call to arms is too great for only one of them.

In this situation, the silvers insist that a neutral arbiter becomes their leader, at least for as long as they must work together. Despite this tendency, or maybe because of it, silver dragons in an area gather once a year or so to discuss the conditions of the land or whatever crusade or quest occupies their time.

A silver dragon classifies each creature it meets as a mentor, ally, charge, rival, or enemy.

Nearly every silver dragon considers one creature—usually a gold dragon—as its mentor and advisor. This relationship is almost always the most important in a silver dragon’s life, as a good mentor helps the silver remain true to its ideals and the expectations placed upon it. Allies take a number of shapes, but nearly all of them are good creatures who respect, uphold, and enforce order and lawfulness. A silver’s mate usually falls in this category, although two very strong silver mates might actually see one another as rivals instead. To a silver dragon, its charges are those creatures not able or willing to protect themselves, which includes

nearly every creature a silver dragon meets.

Although they never act against one another (for doing so harms the advancement of their own ideals), silver dragons rarely directly support each other except in dire circumstances. Enemies of silver dragons are

all creatures that support or practice evil or who break laws and receive no punishment.

Despite their physical power and unquestionable bravery in battle, silver dragons do not relish warfare. They do not seek to test themselves against strong foes. When they enter combat, it is not from bloodlust or the desire for glory. Silver dragons physically battle their enemies because some creatures only respond to violence. Silver dragons end battles as quickly as they can, avoiding as much bloodshed, injury, or suffering as possible. When an enemy begs for mercy or falls unconscious, silver dragons stop. They do not fight longer than necessary and prefer to redeem evil with words and kindness rather than punish it with violence and pain. Unfortunately for silvers, those they most often fight against cannot be easily redeemed. Silver dragons also know they cannot battle evil without a little of it rubbing off on them. Most silvers can cleanse their souls of these minor touches, but some find it more difficult to cope—particularly if they have poor mentors or their beloved advisors are somehow also affected by the evil.

Just as darkness feels most intense when stepping out of a lighted room, no creature's descent into cruelty and evil can match the depravity of tarnished silvers. Fortunately, these blackguard dragons remain almost legends, and no more than a handful exist in any given millennium. Just as fallen angels frequently become something else, losing any connection to the celestial existences they previously led, silver dragons who tarnish fully cease in many ways to be silver dragons. They are not simply dirty, but become fundamentally different, degenerating into strange creatures resembling draconic crossbreeds. The greatest mercy available to these fallen silvers is death, and other creatures relentlessly hunt these lost beings, helping them find redemption in death that they could not acquire in life.

Fortunately, most silver dragons tarnish into neutrality, taking on either a lethargic disregard for that which they once so strongly felt or else pushing so hard for law and order that they forget the purpose of community in the first place. Silver dragons tarnish most easily of the metallics, and their redemption is a long, difficult process that fails more often than not. Many such tarnished creatures forsake their mentors and ignore the advice and pleas of their allies, slipping ever further into whatever malaise gripped them in the first place.

Even among untarnished silver dragons, the tendency to become too stringent and unwavering runs in their blood. Especially among their younger members, the greater good and the need for mercy sometimes get lost in the push for order. These over-achieving paragons of virtue might begin to punish all transgressors of the law with equal severity or else focus on the eradication of

one kind of crime and ignore other lawbreaking directly before them. In the former case, the overzealous silvers punish those guilty of minor crimes almost as harshly as murderers and traitors. Misguided silvers of the latter variety become so appalled by one particular transgression that they develop tunnel vision that blinds them to greater crimes. Humans who must live with silver dragons do not understand or deal well with either form of neurosis, and in such cases a silver's mentor must usually intervene to help him recognize his errors.

HOARD AND HOME

Like all dragons, silvers keep lairs that they consider their safe havens and places of refuge in their most trying times. They also store their hoards in their lairs, often protected by various guardians and the occasional trap. Unlike almost all other dragons, silvers typically make their lairs in the homes of other creatures.

Silver dragons live on the sides of mountains, generally below the snow line in the warmer parts of the world. This occasionally brings them into conflict with reds and whites, as the former tend to claim all manners of mountains while the latter sometimes live in the glacial caps of the highest mountains. These conflicts quickly become violent and always result in the retreat or death of one of the dragons, as compromise is never an option. Usually, when a white dragon sees a silver move onto the same mountain it calls home, it quickly packs up its hoard and flees—hopefully before the silver spots it.

Dark, dank, lonely caves seldom appeal to silver dragons, and most of them prefer to live within or under human or dwarf-built fortresses on the sides of mountains. These dragons do not mind caves as much if they open out into some nigh-impregnable fortress or castle precariously perched upon a mountain. Living in or under such a castle (which must always be controlled by a leader with a proven history of good deeds and generous works, preferably one who also believes strongly in law and order) affords the best scenario for both dragon and landlord. The dragon has a ready-built and heavily defended lair in which he can hide his hoard and the castle gains a powerful defender.

Silver dragons prefer coins and items made from silver, platinum, steel, and other “white” metals (including white gold). They exchange copper and gold coins for silver or platinum whenever they can, and otherwise keep them out of sight in metal chests near, but never part of, their coin beds. This love of silver and platinum extends to the treasures they collect: silver utensils and flatware, platinum jewelry, and other decorations and artworks.

The gems displayed by silver dragons are always diamonds and other white or clear stones. Silvers greatly appreciate uncolored glass and are inclined to collect

ornately decorated (preferably in silver or platinum) crystal and glass drinking vessels, spheres, and even mirrors. Not surprisingly, the magic items they collect most often are made of glass, and they seem to enjoy *crystal balls*, even though they rarely make use of such items.

After defeating powerful foes bearing coats of arms or other markers, silvers take such souvenirs back with them to their lairs, and incorporate them into their hoards. Among their mundane treasures, silver dragons collect many military banners, shields, heraldic devices, signature weapons or armors, and other tokens of remembrance. When these items bear magical auras or were obviously worked by master craftsmen, so much the better.

Silver dragons also enjoy collecting weapons and armors from battles and armies with whom they have no personal involvement. Some of the greatest collections of such military paraphernalia belong to silver dragons, who are occasionally willing to lend out the items they own if doing so serves the greater good. Although silvers are the least greedy of dragons, they still expect collateral of equal or greater value for any items on loan.

CAMPAIGN ROLE

Silver dragons generally appear in a campaign as helpers and guides. They might provide direct physical assistance or merely offer advice. When times are most desperate or dire they might lend material aid to good adventurers who prove themselves trustworthy and forthright. In general, silvers do not make very good patrons, as they busy themselves with tasks they themselves can perform, rather than plans requiring the aid of others. They are known to follow more than lead, and a particularly powerful and virtuous human might gain a silver dragon cohort if he continues to prove himself on the field of battle.

On the other hand, silver dragons are the metallics most likely to go bad. Such practically irredeemable creatures do not lightly cross to darkness, and doing so often costs them their sanity, making battles against them unpredictable and dangerous. Adventurers might on rare occasion be called upon to hunt down these tarnished heroes and put them to rest, lest their insanity undo the long years of good works they performed beforehand.

ON GOLARION

Silver dragons tend to congregate where evil and chaos reign and good and order struggle to gain dominance. In Golarion, such places as the Worldwound and Galt attract the attention of silver dragons, who set up strong points in neighboring nation-states.

To the north, a collection of silver dragons resides in Mendev, where they work with human allies to staunch the unending flow of demonic energy pulsing from the Worldwound. These silver dragons follow the human

leaders of Mendev and serve as heavy shock troops when raids are made across the border.

In eastern Avistan, the murderous nation of Galt has also gained the attention of handfuls of silver dragons, some residing within the country and some living in neighboring Taldor. All attempts so far at restoring peace and order within the revolution-torn land have failed, but where silver dragons openly live, pockets of sanity seem to prevail. The bloodthirsty people of Galt seem somehow less inclined to behead one another under the disapproving gaze of a silver dragon.

A number of silver dragons live on the Elemental Plane of Air, where they frequently do battle against a much larger force of whites. Although these draconic clashes seem random to non-dragons who witness them, the silvers actively oppose any attempt by the whites to gain entry into a number of large, drifting icebergs bobbing along on icy currents of the plane. The white dragons seek legendary artifacts said to hold powers of control and domination only they can use. Understandably, the silver dragons seek to prevent them from gaining such items.

NAMES

Silver dragon names of the pure bloodline often incorporate some variation on the name Argix, the original silver dragon and founder of the bloodline (also, “argix” is Draconic for “silver”). Otherwise, silver dragon names, unlike almost every other aspect of the breed, follow no real patterns or regulations. They tend to be relatively easy to pronounce, but their length and general majesty vary wildly.

Silver Dragon Names: Argithix, Drakstherian, Lastargix, Shargarius, Yarthadrix

TERENDELEV

As one of the Mendevian silvers, Terendelev serves the Iomedean leadership in the border town of Kenabres. There she acts as an enforcer, patrolling the city in the company of a half-dozen human paladins. Terendelev was recently part of a strike team that moved across the border to approach the Worldwound itself. She returned badly scarred and horrifically wounded, bearing three of her human companions with her. Two of the humans she brought back later died from some mysterious ailment or curse they contracted near the Worldwound. The third corroborated Terendelev's report of a demonic ambush against which she seemed ready to die fighting. By the account of her surviving comrade, she very nearly did succumb to the many grievous wounds she received, but the strike team's doomed commander ordered her to gather what survivors she could and escape.

Afterward, Terendelev became moody and dark-spirited. The high cleric of Iomedae in Kenabres noticed a troubling

dark edge to her scales—a physical manifestation of tarnishing—and immediately summoned Terendelev's mentor, the gold dragon Halaseliar. After a days-long discussion that resulted in raised voices and an ineffective attack by Terendelev against her mentor, she agreed to his recommendations. Although her physical wounds have long since healed, Terendelev remains moody and relatively unstable emotionally, but it seems that her friends and allies intervened in time, as the tarnish on Terendelev's scales has noticeably decreased over time.

TERENDELEV

SPECIAL ABILITIES

Alternate Form (Su) Terendelev can assume any animal or humanoid form of Medium size or smaller as a standard action three times per day. She remains in this form until she chooses a new one or returns to her natural form.

Cloudwalking (Su) Terendelev can tread on clouds or fog as though on solid ground. The ability functions continuously but can be negated or resumed at will.

White Dragons

White dragons are stupid, weak, savage, and pathetic—as dragons go. In reality, many of them still exceed humans in mental prowess, but among their draconic kin such a thing is hardly considered a bragging right. And yet, they remain true dragons, and their potential for glorious splendor remains unequalled by all but the very pinnacles of humanity. Pathetic and stupid, yes, but history does not forget those few white dragons who rose above the limitations of their breed and became truly remarkable.

—*Drakanav Codex*, Chapter 20

Described with great disdain by all other true dragons as nasty, brutish, and short-tempered, white dragons in many ways act more like feral predators than representatives of dragonkind. While all chromatic dragons share a particularly powerful instinct of self-preservation bordering on cowardice, white dragons are unrepentantly craven. They lack the intelligence to make well-considered decisions and the wisdom to realize the depths of their own ignorance. Inbred for millennia, white dragons revel in cruel, crude humor and hold no appreciation for the arts or higher learning. White dragons represent all the things their loftiest blue or red cousins hate of the lesser creatures, but are made worse in draconic eyes by their distant relation. Yet despite their relative weakness, stupidity, and repulsive behavior, older white dragons are still superior to average humans in nearly every way.

Fresh from the egg, white dragons psychologically resemble alligators or other simple-minded yet powerful predators rather than the magnificently powerful creatures whose culture predates elven civilization. Driven

by instinct and their ever-gnawing stomachs, immature white dragons rarely attempt communication with other creatures except to form crude bargains that bring them more prey or treasure. Few of these poorly considered bargains benefit the white dragons in the long run, and many of the deals place the foolish simpletons in greater danger than they can foresee. Those who strike such questionable bargains must be careful, however, not to allow their duped partners to grow too old, for despite their disadvantaged beginnings, white dragons eventually age into cunning, careful schemers. While their most careful plans might seem ludicrously simple to their more intelligent cousins, the schemes of the cleverest white dragons can nonetheless require months to come to fruition and involve not only the deaths of those who tricked them in their youths, but also the destruction of all their erstwhile tormentors hold dear. The cold, long-smoldering fury of white dragons drives many of them into lives filled with vengeance-seeking and complicated arrangements that lead to the ruin of their targets—or else to mounting frustrations as their own impatience undermines their careful plans. Some whites—those who by fortune or unusual guile lead relatively peaceful lives of predation and hunting—grow older and scheme not of revenge, but of advancement. Unfortunately, even these white dragons cannot escape their instinctual savagery and impatience, and the greatest among them always seem to remain one or two steps away from their goals.

Characterized by the large webbed horns radiating out from the backs of their skulls and connected by tough, fibrous membranes, the distinctive heads of white dragons also possess crag-like hornlets on their chins and lower jaws. The rough texture of their faces extends over much of their bodies, allowing them to break up their silhouettes and granting them additional camouflage in their snowy homes. White dragon scales are thick and rough to the touch, and the tiny ridges that give them their rough feel trap in heat, keeping the whites warm even in the coldest of climes. Lithe and muscular, white dragons look every bit the part of efficient predators, with long, scimitar-like claws and powerful jaws holding razor-sharp teeth.

ECOLOGY AND SOCIETY

The scales of whites help them blend in with their surroundings, making them natural ambushers. Across the windswept fields of snow that form the Crown of the World, white dragons live as the top predators. They dominate the tundra and arctic wastelands of the far north, proclaiming themselves kings of unwanted and scantily inhabited kingdoms. Their vast territories cover hundreds or thousands of square miles but contain fewer intelligent beings than most towns. White dragons care little for exerting control over those residing within their

territories, as they view all other living creatures either as potential food or potential enemies. Those they cannot eat they swiftly grow to hate.

Some few whites eschew their bitter northern climes and instead live on mountain glaciers within the more temperate parts of Avistan. These whites gain notoriety more often than their northern siblings, as they have more frequent interactions with intelligent beings. Most of the white dragons known to humans come from the high mountains of northern and central Avistan. History records a handful of white dragons who lived around the Inner Sea and south into Garund, but the majority of these dragons are famous only for where they chose to live and not for any accomplishments they performed in life.

White dragons tend to stand at the top of the local food webs, usually supplanted only by more powerful dragons of other colors, and then only when they live farther south. None of the other chromatic dragons, even the covetous and wide-ranging reds, care enough for the cold lands to bother evicting the white dragons who live as masters there.

Although they are consummate hunters and predators without equal in their home climate, white dragons remain shameless opportunists. The unforgiving wastes of the frigid north do not allow even the fearsome whites to be picky about what they eat or when. White dragons prefer warm meat, preferably ripped from still-living creatures, but they eat anything that remotely resembles food, including even rotting meat and plant matter.

White dragons rampage more than any other dragons, even the mighty reds. As even non-dragons rarely afford them the respect and fear they deserve, white dragons frequently lash out at their humanoid neighbors out of frustration, retaliation for insults, or vengeance. These rampages usually garner the whites the attention, respect, and fear they crave, but those dragons who grow too careless sometimes lose their lives instead.

White dragons only rarely engage in draconic society at any sort of useful level. They usually avoid contact with all other kinds of dragons, as many of their cousins simply attempt to kill them on sight. Among their own kind, however, whites occasionally prove strangely social and outgoing. White dragon mating rituals are like young cats play-fighting—teeth and claws displayed but not used, much hissing and rolling around, frequent dominance shifts, and no clear winner. Females usually mate with several males, and clutches usually have multiple fathers.

White dragons work together at times to bring down particularly large prey or entire herds of lesser game. This camaraderie is far more common among young whites, who lack the strength and power to bring down extremely large creatures on their own. Such hunting groups can

last for a single hunt or several years, depending on the personalities involved and the availability of large game. Like their black dragon cousins, white dragons are liable to depopulate their hunting territories to the point where the dragons can only barely sustain themselves. Unlike black dragons, though, white dragons stubbornly refuse to abandon their home territories, choosing to enter periods of long hibernation to allow prey to repopulate rather than moving on to new hunting grounds. Tragic stories abound of lost travelers on the Crown of the World stumbling across a deeply hibernating white dragon they at first believed to be dead. When food grows scarce, packs of hunting whites may turn on each other and devour the weakest members.

White dragons prove notoriously difficult to redeem. Among the chromatics, only the reds resist the call for temperance and benevolence more than the foul-tempered whites. Draconic sages with a sense of humor note quite the opposite, and point out that white dragons are frequently redeemed—some are redeemed on a weekly basis. Weak-willed and easily cowed, white dragons generally do whatever a stronger personality tells them, including proclaiming themselves converted to the way of goodness. Once out of the direct control of whatever force converted them by the sword, however, whites quickly resume their old ways. Truly redeemed whites remain mere legends, and most creatures capable of subduing and redeeming white dragons simply slay the beasts instead.

By the time they reach adulthood, white dragons possess mental capacities at least equal to average humans. Unfortunately, by that time, most white dragons wallow in the same savage habits and limited thoughtfulness that cursed them throughout their immature years. Although physiology no longer limits them, adult white dragons nonetheless cannot imagine living their lives any differently than they already have for decades. Thus, most great wyrm whites, who in theory can reason and contemplate better than almost any human in the world, cannot escape the short-sighted and savage brutality of their younger years. Of course, white dragon great wyrms remain so incredibly rare that the few who have lived so long prove far more wily and careful than their kin.

A few white dragons yearn for something more than the brutal savagery of their ancestral homes and instinctual natures. Although most of these whites possess the same limited intellect of their fellows, they try to pursue academic, philosophical, or sociological achievements. Other white dragons despise these specimens, calling them *lazakh*, which roughly translates as “big heads,” a term typical white dragons use in derision but that other dragons adopt as a term of endearment. Those *lazakh* who declare their intentions to their common fellows are usually met with aggression. The one or two *lazakh* every generation who avoid fratricide and humanoid dragonslayers are occasionally taken in under the wing of a benevolent or manipulative cousin—usually a caring brass, academic bronze, controlling blue, or patient green.

When they serve bronze or green mentors, these white dragon *lazakh* can meaningfully contribute to the collective knowledge of dragons and all other intelligent species, performing simple tasks suited to their inbred impatience and relative stupidity (such as recording notes on slabs of slate, finding particular passages in tomes, or other duties quickly and easily performed). Most of these mentors find that their white dragon charges do not decrease the time or effort they must themselves contribute to their studies and research, and in some cases taking on white dragon apprentices slows their progress. Nonetheless, stories exist of seemingly average white dragon apprentices providing sudden insights or leaps of logic that grant their mentors solutions to vexing conundrums, and

thus bronze and green dragons continue to take on white dragons in the hopes of finding the next such idiot savant.

Brass and blue dragons are inclined to guide their white dragon charges in more social ways. Brass dragons attempt to bring out the creative side of the *lazakh* they mentor, thereafter promoting the often-violent but always memorable imagery of their understudies in small showings and members-only galleries. Most famously, the white dragon Tryka wrote the popular play *Red Snow Falling* under the watchful tutelage of the brass dragon Varilan (see sidebar). Blue dragons care little for the goals and desires of their white dragon charges, instead carefully manipulating them to act as contacts, spies, or muscle in the blue dragons' own immense webs of minions. Most of these unfortunate *lazakh* never realize their blue masters are using them and spend decades or centuries working hard for goals not their own. When called out for this treatment of their kin by meddlesome brasses or controlling golds, blue dragons defend themselves by pointing out how much better off these white dragons are than their arctic-dwelling kin. Indeed, despite their stunted advancement in their own goals, whites who serve blues can become exceedingly wealthy (often much more so than those serving brass, bronze, or green mentors).

HOARD AND HOME

White dragons are pack rats that never throw out anything, and thus their hoards are as varied and individualistic as the dragons who form them. Unlike all other kinds of true dragons, whites do not possess any preference for one kind of treasure or another. They take what they can get, which in the coldest extremes of the far north and mountain summits is not much, and they never turn down anything they figure might be worth even a few coins to some other creature. White dragons' hoards vary wildly from one individual to the next.

Although most white dragons remain unapologetic opportunists and do not actually favor any kind of item over any other, their hoards do share a few similarities based on the typical locations in which they live. In general, white dragon hoards contain more goods and equipment than coins, gems, or jewelry—typically equipment used to survive the harsh conditions, including cold-weather outfits, winter blankets, ropes and grappling hooks, and so on. White dragons jealously guard their rare magical items and go to oft-bizarre lengths to protect such treasures.

White dragon coin beds run significantly smaller on average than those of their cousins, and most supplement this lack of size with items made of non-precious metals, such as steel hammer heads or iron pitons. Many white dragons keep their coin beds above the surface of the ground, not in shallow depressions like their kin, and

RED SNOW FALLING

In 4374 AR, the white dragon *lazakh* named Tryka fled her unforgiving homeland and traveled into the heart of Avistan. Her arrival at the Five Kings Mountains roused Daralathylx, and she only barely survived the encounter. Terribly scarred by the king's wrath, Tryka fled southwest into Cheliah, where blood loss and fatigue felled her from the sky. By her great fortune, a dragon named Varilan discovered her and took her back to his lair to recover. Varilan (in human form) lived the life of a Chelish playboy and socialite in the baronial courts, and after nursing Tryka back to health, he offered to mentor her in the arts as long as he could keep the greater part of the profits. Tryka accepted, and the two collaborated on a variety of creative endeavors (mostly of questionable artistic quality).

In 4413, Tryka lost her patience with their lack of success and threw a terrible fit that ruined years of work. Varilan stopped her in mid-rampage, though, telling her to channel that furious energy into something creative. Taking the admonition as a challenge, she poured her frustrations and anger into writing *Red Snow Falling*, a play about her narrow escape from Daralathylx. With her permission, Varilan edited the story to make the characters humans and promoted it in the smaller theatres of the Chelish empire. The play was an instant success, and at the height of its popularity in the next century, it played in some of the largest theatres in the Inner Sea region. Although not as popular today as a couple centuries ago, the play remains in constant circulation among the continent's theatres and seems a perennial favorite in Cheliah, Korvosa, and Ustalav.

prevent the coins from scattering by shaping low ice walls that help contain their collections.

White dragons live in ice caves or in stone caverns adorned with ice. They typically occupy lairs much larger than their size or overall prowess would otherwise suggest. Scholars attribute this particular phenomenon to a lack of competition, as white dragons have few rivals for living space in their native environment. No other dragons are fond of cohabiting their chosen regions, although silvers and reds do occasionally take up homes on the same or adjacent mountains as warmer-living whites.

Whites do not mind taking or sharing the lairs of other creatures or forcing other beings to expand their lairs for them. Many white dragon lairs open onto deep vertical shafts in the ice generally accessible only to those creatures that can fly or otherwise easily navigate ice cliffs. Their caves stretch back and down from the entrances, utilizing the slippery nature of ice to deposit land-borne creatures into dark, forgotten crevasses filled with salted water or inhabited by beings otherwise too terrible to consider.

Because they lack the great strength and terrible resolve of their kin, white dragons must frequently share their

homes with more powerful creatures that dwelled within them first. When these creatures possess any kind of intelligence, the white dragons gladly work out lines of demarcation to divide the lair between them. Otherwise, the whites lure their lairmates to out-of-the-way portions of their homes, where they then shape the ice to send would-be dragonslayers and other trespassers. In this way, the greatest dangers in white dragon lairs are sometimes not the dragons themselves, but the original inhabitants of their lairs that dwell in dark recesses.

Since most dragon-hunting creatures cannot survive the extreme iciness of their prey's environment for long periods of time, white dragons set up traps in their lairs that utilize the unrelenting cold. Pools of frigid salt water concealed under or held behind thin ice are designed to douse trespassers and their equipment in sub-freezing water. A favorite trick of white dragons is to watch from a safe distance and wait for their water traps to soak trespassers before swooping in with their icy breath. This crude technique proves surprisingly effective.

CAMPAIGN ROLE

Unlike most of the other kinds of dragons, whites really serve only one purpose in a campaign: to antagonize the PCs. They make excellent ambushers, dropping down out of foggy or snow-blown skies to shred horses and other beasts of burden before disappearing again into the weather. Some whites also set up ambushes along the few trade routes and traveled paths across the Crown of the World. Those who live farther south lurk in frigid mountain passes or upon snow-capped peaks.

White dragons also make good direct opponents. Most white dragons are driven by hunger and instinct, and they do not take the time to set up ambushes (or in some cases even imagine the possibility of doing so). Instead, these up-front whites charge into battle, blasting their foes with their icy breaths before lashing out with claws, fangs, and tails. If these charging whites can gain some kind of surprise, all the better, but it is not a factor in their decision to attack or not.

On the other hand, white dragons remain dragons, the most feared and powerful creatures known. The most dangerous asset they possess is their greater-than-human intelligence when they grow older. Although no less savage than their younger kin, older white dragons use more sophisticated tactics and like to observe potential prey before attacking—particularly if that potential prey walks on two legs and carries weaponry, and even more so if it carries nothing at all. These older white dragons might spend several days tormenting those creatures they intend to attack, driving off or slaughtering pack animals at night, causing minor avalanches, luring lesser predators near their targets, or otherwise hampering the hapless humans.

Once the morale of their victims sinks low enough, or one of them succumbs to the cold, the dragons attack.

Those white dragons who dare to seek more from life than mindless slaughter and become *lazakh* can make for memorable contacts. Although they seek personal advancement and hope to somehow contribute notably to the vast stores of draconic knowledge, they remain unapologetically selfish, impatient, and cruel. Humans and weaker dragons dealing with *lazakh* must remain conscious of the unpredictable nature of white dragons and treat with them very carefully.

Due to a white dragon's innate cowardice and weak will, it is possible for a strong and dominating group of PCs to subdue one and force it into servitude, perhaps in the hopes of eventually redeeming it. In these cases the dragon is a powerful minion (or slave, in the case of a cruel or evil party), but one that should be kept on a short leash. Even a "tamed" white feels cold, seething hatred for those who bested it, and is likely to take advantage of a momentary weakness to slaughter its "friends" and escape to a place where it can resume its old habits.

ON GOLARION

Most white dragons—by some estimates more than three-quarters—live on the Crown of the World or in the portions of Avistan, Casmaron, and Tian Xia within a hundred miles of that region. Creatures wanting to cross the northern passes usually see or encounter at least one white dragon along the way, and the least fortunate expeditions face several. Every square mile of the icy continent lies within at least one white dragon's hunting territory, and terrible border disputes can sometimes spill onto the trade routes over the continent as the dragons tear apart a caravan to stake their claims.

Other white dragons live under the greatest glaciers of high, snow-clad mountains, such as the Kodar, Menador, and Mindspin ranges. Dwarven histories record that at least two white dragons lived on the glaciers of Droskar's Crag before the arrival of Daralathylx more than 1,700 years ago. These dragons each controlled one half of the immense mountain and endlessly tormented the dwarves and other creatures of the area.

Ostracized by their fellow dragons and hunted like common pests by the lesser creatures of Golarion, a small number of white dragons live on the Elemental Plane of Air. These dragons are drawn to clusters of floating icebergs that follow gentle currents through the plane, though silver dragons defend these icebergs from the intrusions of the whites. Sages speculate the white dragons seek the legendary artifacts known collectively as the *Shastiled*, which are said to hold the keys to the white dragon breed gaining some level of dominance over other dragons.

NAMES

White dragon names are generally either short and simple or overly complicated and difficult to pronounce. When hatched, white dragons receive simple, easy names, as their mothers hardly care enough about them to grant them lofty or impressive titles. As they grow older, though, some whites add syllables to create longer names in the hopes of sounding more impressive than they really are, though never so long that the dull-witted whites can't pronounce their own names.

White dragon names: Aostala, Grathalax, Horrakis, Oreptonthas, Tix

LYDEK

Lydek delights in her own savagery, and sometimes pursues human prey simply for the pleasure of feeling the warmth of their innards on her razor-sharp claws. She claims Mount Thaharak in the Tusk Mountains as her home and hunting territory.

Such is Lydek's influence over this area that several trade routes shifted to avoid passing near Mount Thaharak, despite the successful crossing of most caravans through her lands. Those who brave the wrath of the dragon and attempt to climb the peak face carefully hidden pitfalls, washed-out or blocked trails, and frequent avalanches. Despite being a relative pushover where draconic threats are concerned, Lydek escapes the notice of dragonslayers powerful enough to overcome her by controlling unimportant territory with only a few trade routes passing through it.

LYDEK

0 (5/day)—*detect magic*, *detect poison*, *mage hand*, *open/close*, *prestidigitation*

TACTICS

Before Combat Lydek attempts to weaken or demoralize

opponents by driving them into the dozens of traps she has scattered around her mountain home. When ready to actually face opponents in combat, she first engulfs the chosen battlefield in a *freezing fog*. If Lydek cannot choose the time and place of a battle, she tries to flee.

During Combat Lydek tries to keep her

foes contained within a relatively small battlefield, both to maximize the effectiveness of her breath weapon and also to prevent them from escaping her *freezing fog*.

If a trap is nearby, she attempts to drive or lure her foes into it. Once she has weakened, confused, and demoralized her

opponents, Lydek drops into their midst

and uses melee attacks.

Morale Outside of her lair, Lydek flees once she takes

30 points of damage. She then resumes harrying her opponents with traps and other trickeries before luring or herding them toward a second battlefield, where she resumes her strategy.

SQ icewalking

SPECIAL ABILITIES

Freezing Fog (Sp) Similar to *solid fog*, this also causes a rime of slippery ice to form on any surface the fog touches, creating the effect of a *grease* spell. Lydek is immune to the *grease* effect because of her icewalking ability. This is the equivalent of a 5th-level spell and is useable three times per day.

Icwalking (Ex) This works like the *spider climb* spell, but the surfaces Lydek climbs must be icy. It is always in effect.

The King & Queen of Dragons

Bahamut & Tiamat

by Skip Williams

illustrated by
Carl Critchlow

Of all the creatures ever created for the DUNGEONS & DRAGONS® game, none have fired the imagination so strongly as Bahamut and Tiamat, the two most powerful dragons of all. So, here they are once again, with scales, teeth, and claws newly polished and presented as monsters for the 3rd Edition D&D® game.

Of course, Bahamut and Tiamat are not mere monsters, but deity-class creatures (perhaps full-fledged deities); as such, the statistics presented here are only approximations based on the present knowledge of mortal sages. Perhaps we will learn more about them in the future.

Each of the two entities presented here are more than a match for a party of 20th-level characters all by themselves. Throw in their respective entourages and you have enough power to level whole countries (or worlds). Such creatures are never suitable as mere dungeon fodder, no matter how powerful the characters facing them are.

Both dragons are beings who live and act on a cosmic scale, so use them appropriately. Tiamat concerns herself with spreading evil, defeating good, and propagating evil dragons. She enjoys razing the occasional village (or city, or country), but only as a diversion as she weaves subtle and world-spanning plots. She is the villain who lurks in the shadows, whose presence is felt, but who is seldom seen. Bahamut is among the most compassionate beings in the multiverse. He is dedicated to the cause of good but prefers to let mortals find their own way; he is the main reason Tiamat must work in secret. Bahamut is an old hermit whose subtle prophecy unlocks a great mystery (provided the players are wise enough to use and recognize the clue), or the kind stranger who offers a safe refuge or that badly needed spell.

3rd Edition Exclusive!

The new incarnations of Tiamat and Bahamut are not slated to appear anywhere else in the foreseeable future, so this sneak preview of 3rd Edition monsters is also the official return of the most fearsome dragons in the D&D world!

Bahamut

Colossal Dragon

Hit Dice: 53d12+742 (1,086 hp)
Initiative: +4 (Improved Initiative)
Speed: 60 ft., Fly 300 ft. (poor), Sw 60 ft.
AC: 54 (-8 size, +52 natural)
Attacks: Bite, +66 melee; 2 claws, +61 melee; 2 wings, +61 melee; tail slap, +61 melee
Damage: Bite, 4d8+21; claw, 4d6+10; wing, 2d8+10; tail slap, 4d6+10
Face/Reach: 10 ft. by 50 ft./20 ft.
Special Attacks: Breath weapons, frightful presence, spells, spell-like abilities
Special Defenses: Scent, spell resistance 30, damage reduction (25/+4), immunities, *see invisibility*, keen senses, *water breathing*
Saves: Fort +43, Ref +29, Will +42

Climate/Terrain: Any land and underground
Organization: Solitary (1), Troupe (Bahamut and seven great gold wyrms).
Challenge Level: 25 (solitary)
Treasure: When traveling, Bahamut carries his magic items and 1d8+4 gems of various sizes. Bahamut's palace contains 2d4 level 20 treasures.
Alignment: Always lawful good
Advancement Range: N/A

Also known as the Platinum Dragon and the King of the Good Dragons, Bahamut is revered as a deity in many locales. Although all good dragons pay homage to Bahamut, gold, silver, and brass dragons hold him in particularly high regard. Other dragons, even evil ones (save perhaps, his arch-rival Tiamat), respect Bahamut for his wisdom and power.

In his natural form, Bahamut is a long, sinuous dragon covered in silver-white scales that sparkle and gleam even in the dimmest light. Bahamut's catlike eyes are a deep blue, as azure as a midsummer sky, some say. Others insist that Bahamut's eyes are a frosty indigo, like the heart of a glacier. Perhaps the two accounts merely reflect the Platinum Dragon's shifting moods.

The location of Bahamut's home seems to breed disagreement among sages. Some insist that he dwells in a great palace behind the north wind and add Master of the North Wind to his list of titles; other, older tales say Bahamut dwells behind the east wind, in a fabulous palace of the same name. In any case, Bahamut visits the world often, usually in the guise of an old man or a

callow youth. He is always accompanied by an honor guard of seven great gold wyrms that take the forms of fellow travelers or animals. Bahamut keeps a wary eye out for the machinations of Tiamat, taking whatever actions he deems necessary to check the spread of her influence and to undo whatever damage she has wrought. Bahamut will never turn his back on a lawful good creature in peril, but seldom intervenes directly if Tiamat is not involved. Instead, he offers healing, advice, or information. Bahamut's wanderings have given rise to many bard's tales, the best known of which relates a roadside meeting with an unassuming old man and his flock of seven trained canaries. None would have been the wiser, says the tale, had a band of ogres led by an ogre mage not chosen to sweep down upon the crowd.

Bahamut speaks many languages, including Draconic, Celestial, Auran, and Common, though he can converse with any intelligent creature.

Combat

Bahamut is a dangerous adversary. If the opposition is both evil and fairly weak,

he might simply loose his breath weapon or a high-level spell and obliterate the foe in an instant. If unsure of the foe's strength, Bahamut prefers to fight cautiously, relying on spells and his shapechanging ability to test the foe's mettle before attacking in earnest.

Breath Weapons (Su): Bahamut has three different breath weapons:

Cold: A cone of cold 80 feet long that inflicts 36d10 points of damage. A Reflex saving throw vs. DC 50 reduces the damage by half.

Gaseous Form: A swirling mist that fills a cone 80 feet long. Creatures within the cone are stunned and turned into gaseous form for 32 rounds. A Fortitude saving throw vs. DC 50 negates the effect.

Disintegration: A beam of blue light that fills an area 5 feet high, 5 feet wide, and 160 feet long. Creatures are obliterated if they fail a Fortitude saving throw vs. DC 50. Creatures who make successful saving throws still suffer 18d10 points of damage. The beam blows a 5-foot x 5-foot x 160-foot hole in objects if they fail their saving throws and inflicts 18d10 points of damage if they make their saving throws.

Once Bahamut uses a breath weapon, he must wait 1d4 rounds before he can breathe again, no matter which breath weapon he has used.

Frightful Presence (Ex): Bahamut can unsettle foes with his mere presence. The power takes effect automatically whenever Bahamut attacks, charges, or flies overhead. Creatures within a radius of 480 feet are subject to the effect if they have 52 or fewer Hit Dice.

An affected creature can resist the effect by making a successful Will saving throw vs. DC 48. A successful saving throw makes a creature immune to Bahamut's frightful presence for one day. Creatures with 4 Hit Dice or fewer become panicked for 4d6 rounds if they fail their saving throw. Creatures with 5 or more Hit Dice become shaken for 4d6 rounds if they fail their saving throw. Good dragons (and Tiamat) ignore the effects of Bahamut's frightful presence.

Spells: Bahamut is a 20th-level sorcerer and a 20th-level cleric with access to the Good and Air domains. In his natural form, Bahamut can cast his spells with but a word.

Spell-like Abilities: Bahamut can use the following spell-like abilities each three times a day as a 20th-level caster: *control water*, *control winds*, *control weather*, *create food and water*, *detect thoughts*, *feather fall*, *fog cloud*, *foresight*, *quest*, *speak with animals*, and *sunburst*. Bahamut also can use *shapechange* at will as a 20th-level sorcerer.

Where applicable, the saving throw DCs against these abilities are 14 plus the spell level.

Immunities (Ex): Bahamut is immune to acid, cold, electricity, fire, poison, sleep, and paralyzation effects. Bahamut ignores the effects of spells and spell-like abilities of 5th level or less, just as if the spellcaster had failed to overcome Bahamut's spell resistance.

See Invisibility (Ex): Bahamut has the extraordinary ability to see invisible creatures. This works like the *see invisibility* spell with a range of 1,600 feet. This power is always active.

Keen Senses (Ex): Bahamut sees four times as well as a human in low light conditions and twice as well in normal light. He also has darkvision to a range of 1,600 feet.

Water Breathing (Ex): This ability allows Bahamut to breathe underwater indefinitely. He can freely use his breath weapons, spells, and other abilities while submerged.

Magic Items: Bahamut typically carries the following items: An *amulet of proof against detection and location*, *bracers of armor +8*, *cloak of displacement*, *cubic gate*, a *cube of force*, *gem of brightness*, *glove of storing*, *portable hole*, *+5 ring of deflection*, *+5 ring of resistance*, *rod of alertness*, *rod of cancellation*, *rod of enemy detection*, and *staff of power*. The bonuses these items grant are not reflected in the numbers listed above.

Bahamut, the Platinum Dragon

Tiamat

Colossal Dragon

Hit Dice: 49d12+588 (906 hp)

Initiative: +4 (Improved Initiative)

Speed: 40 ft., Fl 150 ft. (clumsy), Sw 40 ft.

AC: 50 (-8 size, +48 natural)

Attacks: 5 bites, +60 melee;

2 wings, +55 melee; sting, +55 melee

Damage: Bite, 4d6+19; wing, 2d8+9; sting, 4d6+9 plus poison

Face/Reach: 15 ft. by 40 ft./15 ft

Special Attacks: Breath weapons, frightful presence, sound imitation, spells, spell-like abilities

Special Defenses: Scent, spell resistance 30, damage reduction (25/+4), immunities, see invisibility, keen senses, water breathing

Saves: Fort +39, Ref +27, Will +34

Abilities: Str 49, Dex 10, Con 35, Int 28, Wis 25, Cha 28

Skills: Alchemy +35, Bluff +61, Concentration +63, Diplomacy +61, Gather Information +59, Intimidate +61, Knowledge (arcana) +31, Knowledge (drag-

onkind) +34, Knowledge (history) +31, Knowledge (the planes) +31, Knowledge (religion) +31, Listen +61, Scry +61, Search +61, Sense Motive +59, Spellcraft +61, Spot +61, Wilderness Lore +33

Feats: Alertness, Blind-Fight, Combat Casting, Hover, Improved Critical (Bite), Improved Initiative, Expertise, Fly-By Attack, Power Attack, Quicken Spell-like Ability (*domination*), Snatch, Wingover

Climate/Terrain: Any land and underground

Organization: Solitary (1), Troupe (Tiamat and 1d6 chromatic dragons, of age categories 1d8+4)

Challenge Level: 25 (solitary)

Treasure: When traveling, Tiamat carries her magic items and 2d12+2 gems of various sizes. Tiamat's lair contains 2d4 level 20 treasures.

Alignment: Always lawful evil

Advancement Range: N/A

Tiamat is also known as the Chromatic Dragon and the Queen of the Evil Dragons. Like her arch-rival, Bahamut, she is revered as a deity in many locales. All evil dragons pay homage to Tiamat; green and blue dragons acknowledge her sovereignty the most readily. Good dragons have a healthy respect for Tiamat, though they usually take care not to mention her or even think about her at all.

In her natural form, Tiamat is a thick-bodied dragon with five heads and a wyvern's tail. Each head is a different color: white, black, green, blue, and red. Her massive body is striped in those colors.

Tiamat dwells in the upper reaches of Baator, where she rules a realm populated mainly by dragons, other scaly creatures of diverse types, and an assortment of devils (particularly the abishai devils, who resemble evil dragons). Tiamat's consorts include great wrym dragons of the white, black, green, blue, and red types.

Tiamat is very active in the world. She usually travels in the guise of a bewitching human or elven female. Several evil dragons of various types either accompany her in disguise or lurk out of sight nearby. Tiamat constantly seeks to extend the power and dominion of evil

dragons over the land, particularly when her subjects find themselves embroiled in territorial disputes with good dragons. Tiamat also unfailingly demands reverence, homage, and tribute from her subjects.

Tiamat speaks many languages, including Draconic, Infernal, Ignan, and Common, though she can converse with any intelligent creature.

Combat

Tiamat can literally lay waste to large tracts of countryside if she has a mind to do so. She is shrewd enough to capture foes when she can, holding them for ransom, interrogation, or both. Tiamat loves physical combat and assumes her natural form to close to melee if possible. She can bite with all her heads, even if she moves or charges during a round. Instead of biting, each head can use a breath weapon or a spell-like ability as a standard action. Tiamat can cast one spell each round, which counts as a standard action for one of her heads.

It is possible, though not easy, to sever Tiamat's heads in much the same way one can sever a hydra's head. Severing a head requires a slashing weapon. If the blow inflicts at least 185 points of damage, the head is severed.

Breath Weapons (Su): Each of Tiamat's five heads produces a different breath weapon, as follows:

White: A cone of cold 70 feet long; creatures within the cone suffer 12d6 points of cold damage.

Black: A line of acid 5 feet high, 5 feet wide, and 140 feet long; creatures within the area of effect suffer 24d4 points of acid damage.

Green: A cone of corrosive gas 70 feet long; creatures within the cone suffer 24d6 points of acid damage.

Blue: A line of lightning 5 feet high, 5 feet wide, and 140 feet long; creatures within the area of effect suffer 24d8 points of electrical damage.

Red: A cone of fire 70 feet long; creatures within the cone suffer 24d10 points of fire damage.

Each of Tiamat's breath weapons allow a Reflex saving throw vs. DC 46 for half damage.

Once one of Tiamat's heads breathes, the head must wait 1d4 rounds before it can breathe again.

Frightful Presence (Ex): Tiamat can unsettle foes with her mere presence. The power takes effect automatically whenever Tiamat attacks, charges, or flies overhead. Creatures within a radius of 450 feet are subject to the effect if they have 48 or fewer Hit Dice.

An affected creature can resist the effects by making a successful Will saving throw vs. DC 43. A successful saving throw makes a creature immune to Tiamat's frightful presence for one day. Creatures with 4 Hit Dice or fewer become panicked for 4d6 rounds if they fail their saving throw. Creatures with 5 or more Hit Dice become shaken for 4d6 rounds if they fail their saving throw. Evil dragons (and Bahamut) ignore the effects of Tiamat's frightful presence.

Sound Imitation (Ex): This extraordinary ability allows Tiamat to mimic any voice or sound she has heard at any time she likes. Listeners can detect the ruse with a successful Will saving throw vs. DC 43.

Spells: Tiamat is a 20th-level sorcerer and a 20th-level cleric with access to the Evil and Law domains. (Tiamat also gains the granted powers associated with those domains.) In her natural form, Tiamat can cast her spells with but a word.

Tiamat, The Chromatic Dragon

Spell-like Abilities: Tiamat can use the following spell-like abilities each three times a day as a 20th-level caster: *command plants*, *control weather*, *darkness*, *domination*, *fog cloud*, *gust of wind*, *mirage arcania*, *plant growth*, *suggestion*, *summon swarm*, *veil*, and *ventriloquism*. She can use the following powers once a day as a 20th-level caster: *eyebite* and *discern location*.

The saving throw DCs for these abilities are 19 plus the spell level.

Tiamat has the ability to *corrupt water* once a day. This ability causes up to 10 cubic feet of water to become stagnant, foul, inert, and unable to support animal life. The ability can spoil magical potions and any other liquid containing water; unattended items are automatically fouled. Items in a creature's possession remain unaffected if the bearer makes a successful Will saving throw vs. DC 43.

Tiamat can *charm* reptiles three times per day. The power operates as a *mass charm* spell (Will saving throw vs. DC 27 negates), but the ability works only on reptilian animals. Tiamat can communicate with any reptiles she has *charmed* as though using a *speak with animals* spell.

Poison (Ex): Creatures Tiamat stings with her tail suffer 3d6 points of temporary Constitution damage unless they make a Fortitude saving throw vs. DC 46. After 1 minute, poisoned creatures must make an additional Fortitude saving throw vs. DC 46 or suffer an additional 3d6 points of Constitution damage.

Water Breathing (Ex): This extraordinary ability allows Tiamat to breathe underwater indefinitely. She can freely use her breath weapons, spells, and other abilities while submerged.

Magic Items: Tiamat typically carries the following items: an *amulet of the planes*, +8 *bracers of armor*, *carpet of flying* (6 ft. by 9 ft.), *cloak of displacement*, *crystal ball with detect thoughts*, *darkskull*, *iron bands of Bilarro*, *iron flask* (empty), *orb of storms*, *portable hole* +5, *ring of deflection*, +5 *ring of resistance*, *rod of rulership*, and *rod of splendor*. The bonuses these items grant are not reflected in the numbers listed above.

As you can see, the new D&D game offers a wealth of detail. Most of it will be familiar to veteran players, but here are brief explanations of selected terms:

Size and Type: This line begins with the creature's size category—"Colossal" is the top category, used for creatures more than 64 feet long and weighing more than 250,000 pounds. A creature's size affects its combat abilities.

Type determines how magic affects the creature; for example, the *hold animal* spell affects only Animal type creatures. Type also determines many characteristics, including Hit Dice, attack modifiers, saving throws, and skills.

Hit Dice: A parenthetical listing of the creature's average hit points follows the Hit Dice listing.

Initiative: A parenthetical note shows where the bonuses come from.

Speed: This line replaces the old movement entry. It gives the creature's land speed (the distance it can cover in one move).

Fly: All flying speeds include a maneuverability rating, as follows:

Perfect: The creature can perform almost any aerial maneuver.

Good: The creature is very agile in the air (like a housefly or hummingbird).

Average: The creature can fly as adroitly as small bird.

Poor: The creature flies as well as a very large bird.

Clumsy: The creature can barely fly at all.

Armor Class: This line gives the creature's Armor Class for normal combat. To compare the Armor Classes listed to the AD&D[®] rules, subtract 20 and change the sign. So Tiamat would have an AC of -30 in the old game.

Attacks: This line gives all the creature's physical attacks. The number of attacks is given along with the weapon used along with the attack bonus and the type of attack (melee or ranged). Creatures attack by rolling 1d20. If the attack roll plus the attack bonus equals or exceeds the Armor Class, the attack hits. The attack bonus includes adjustments for size, Strength, and other factors.

Damage: The listing includes adjustments for Strength.

Face/Reach: The numbers before the slash show how much space the creature needs to fight, width first, length second.

The number after the slash is the creature's reach.

Special Attacks: This line lists all the creature's special attacks in the order they are most likely to be used.

Special attacks are Extraordinary (Ex), Spell-like (Sp), or Supernatural (Su).

Extraordinary abilities are nonmagical, don't go away in an antimagic field, and are not subject to anything that disrupts magic; using an extraordinary attack is a free action unless noted otherwise.

Spell-like abilities are magical and work just like spells (though they are not spells and have no verbal, somatic, or material components). They go away in an antimagic field and are subject to spell resistance.

Supernatural abilities are magical and go away in an antimagic field but are not subject to spell resistance. Using a supernatural ability is standard action unless noted otherwise. Supernatural abilities will have a daily use limit or can be used at will, just as spell-like abilities are.

Breath Weapon (Su): A dragon's breath weapon is usable once every 1d4 rounds. Cone shaped breath weapons are as high and wide as the distance from the dragon's mouth.

Frightful Presence (Ex): This power makes the creature's presence unsettling to foes. Shaken creatures suffer a -2 penalty to attack rolls, saving throws, and checks.

Panicked creatures run away from the source of their fear as quickly as they can. Other than running away from the source, their path is random. They have a 50% chance to drop what they are holding, and they flee from all other dangers that confront them rather than facing them. Panicked characters who are prevented from fleeing cower instead.

Poison (Ex): Creatures subjected to poison must make an immediate saving throw or suffer the venom's effects. Sometime later (usually 1 minute), a poisoned creature must make a second saving throw (even if the first one was successful) or suffer an additional effect.

Most poisons inflict temporary ability score damage. Temporary ability score damage returns at the rate of 1 point per day.

Special Defenses: This line lists all the creature's special defenses in the order they are most likely to be used.

Special defenses are Extraordinary (Ex), Spell-like (Sp), or Supernatural (Su), just as special attacks are.

Scent (Ex): The creature can detect other creatures by smell within a 30 foot radius.

Spell Resistance (Ex): Replaces magic resistance from earlier versions of the game. A spell or spell-like ability cannot affect the creature unless the caster rolls the spell resistance number on 1d20 plus the caster's level.

Damage Reduction: Damage from any physical attack (not a magical or energy attack) is reduced by the number before the slash. So if a fire giant smacks Bahamut for 35 points of damage, Bahamut suffers only 10 points of damage. The number after the slash shows the type of weapon that negates the damage reduction. If the giant in our example were using a +4 weapon, Bahamut would have suffered all 35 points from the blow. Creatures that have damage reduction inflict full damage on other creatures that are vulnerable to the same or weaker type of weapon, so Bahamut and Tiamat inflict full damage on each other.

Saves: Creatures have a bonus or penalty that applies to their saving throw rolls. To succeed, a saving throw result has to equal or exceed the saving throw's Difficulty Class, which starts at 10 and goes up, just as Armor Classes do.

There are now only three categories of saving throws: Fortitude (for things that affect the body or the life force), Reflex (for blasts and other area effects), and Will (for assaults on the mind).

Abilities: Creatures now have the same six ability scores that characters do.

Skills: Similar to proficiencies in the AD&D 2nd Edition game. Skill checks use a difficulty class system similar to the one described for saving throws.

Feats: Special powers, somewhat like skills. Note that certain feats presented here (Hover, Flyby Attack, Quicken Spell-like Ability, Snatch, and Wingover) are specific to monsters. These feats are not found in the *Player's Handbook*, but they are described in the new *Monster Manual*.

Skip's primary contribution to the new D&D game has been designing the new versions of the monsters, so don't expect any mercy.

The New Ecology of the Dragons

They're back—and more dangerous than ever!

The inn stood at a crossroads. It fronted on a broad track whose sturdy pavement, carefully laid by hands long since turned to dust, was beginning to surrender to too many years of wear, frost, and invasions from the surrounding forest. A narrow, muddy logging track crossed the road nearby, and a thin stripe of clay and forest debris marked the pavement where the loggers and other two-legged denizens of the forest traveled.

As dusk began to creep over the trees, a ragged foursome trudged up the trail and paused to stare gratefully at the inn. They had the frayed and gritty look of men and women who made their livings by spell and sword. This group was more frayed than most. Under the trail dirt, their tunics and cloaks were mottled with pale splotches where the color had been burned away. Their armor and metal accouterments were tarnished and pitted; whatever had scarred their metal had also left their faces scaly and blistered.

The group was loaded with sacks and bundles. The patrons at the roadside inn had seen their share of rogues, vagabonds, and sell-swords burdened with loot. Overstrained leather bags crammed with who-knew-what were common enough, and even the limp, shrouded form of a carefully wrapped corpse was not out of the ordinary for a group such as this—and indeed, such a burden was among those the group carried. A thin man with a pale scholar's complexion staggered as he bore the wrapped body. A tall fighter followed close behind, toting a pair of oblong bundles over his broad shoulders. The hidden

items had been wrapped in blankets and carefully tied. Flies swarmed around the bundles' drooping ends, where the blankets were bloodsoaked and stiff. Two other armor-clad and pack-laden figures, a man and a woman, completed the group.

The innkeeper scrutinized the group and their burdens from a window, bolted to the doorway, and planted himself on the threshold. Wringing his hands on his apron, he forced himself to smile broadly. "Greetings, milady and gentlemen. Welcome to the Crossroads Inn!" His smile weakened as the group drew nearer and he caught scent of them. "Nobb! Hartcourt!" he screeched over his shoulder. "You lazybones, come help these good people with their packages." Rebuilding his smile with an effort, he turned to the newcomers. "You've obviously come a long way and must be very tired. In two shakes, we'll have your bundles safely put away in the stable. No need to carry them any farther." He fervently hoped there wouldn't be trouble. Some of the patrons inside moved to tables closer to the door, secretly hoping there would be.

There was a brief argument when the foursome refused to give up their bundles and dead comrade. In the end, the innkeeper agreed to tuck the body away in a private room upstairs, and the party reluctantly allowed the bundles to be carried to the stables and stored there under Nobb's watchful eye—once Nobb understood the penalty for disturbing the bundles himself.

The group strode purposefully into the inn to see a dozen patrons at tables near the door, all pretending not to notice the

newcomers. A young woman and an elderly man who were finishing dinner at the bar nodded a greeting. The newcomers selected a cluttered table near the fire. Out of habit, they turned their backs to the fire and sat so they could watch the windows and door—and the other patrons.

"Now, what can I get for you?" the innkeeper queried.

"Wine for four, and silence," the fighter replied.

The innkeeper retreated. The tall fighter's eyes swept the room again, chasing away the inquisitive gaze of the bar's patrons. The old man and young woman smiled benignly, even compassionately, when he glanced at them. Definitely not locals, the fighter thought; they made a handsome couple—father and daughter, perhaps. The fighter immediately decided he liked them. A nudge and a nod from the fighter's scholarly companion drew his attention to the only other obvious traveler in the room: a tall, weather-beaten man sitting alone at a corner table. Although his face was hidden by a hood, the fighter could feel the stranger's eyes boring into him. Now it was his turn to look away.

"Shall we strangers all sit together?" The young woman had arisen and now approached the adventurers' table with the old man in tow. "It would better accommodate the locals. They won't have to strain their necks looking from place to place."

The fighter acquiesced, gesturing to two empty chairs. The innkeeper brought the

Frollich

wine and glasses, then retreated but stayed within earshot.

"I'm Jonnel," the fighter said. He pointed to his thin friend. "This is Tehm, and this is Katarine of Sune," he continued, indicating the plain-looking woman in chain mail, who was favoring her right arm. "Over there is my brother, Jubal." The other fighter coolly regarded the man and woman, then resumed watching the other patrons and the stranger in the corner. "Melody's upstairs. . . indisposed. Temporarily, we hope." Tehm glared at Jonnel, then lost himself in a glass of wine. Jonnel did not seem bothered.

The pair sat. "I'm Hypatia," said the woman, "and my good companion is Sterling. We're from the mountains north of here. By the look of you, you've got quite a story to tell. Tell us about it, won't you?"

Another silence fell over the room. The party members exchanged glances briefly. Katarine rolled her eyes. Jonnel glanced around the table, but no one made an effort to speak. Still, custom was custom; an invitation to a tale was not to be refused. Reluctantly, he took a deep breath and cleared his throat. Best to skip over the last few weeks and just pick up with yesterday. "As fortune had it," he began, "we found ourselves in the woods but a day's march from here with the, um, fruits of our recent labors. The woods had been quiet for several days, and we were edgy."

"We were at each others' throats about it, you mean," Katarine said quietly. "We knew something was wrong, but we had no idea what. We were having an argument when it came upon us. It must have been following us."

"It was a dragon," Jonnel clarified, warming to the tale. "It was immense, ninety feet from nose to tail, if an inch. It had a neck like a tree trunk. I turned when it came on, and all I could see were its teeth, like scimitars." There were gasps from the patrons at the magical word "dragon." The stranger in the corner leaned forward and cupped his chin in his hand, saying nothing at all. Hypatia and Sterling waited expectantly.

"It was damned clever," Jonnel said. "We didn't know what it was at first. We were breaking camp one morning with the usual grumbling about who was going to carry what, when we heard a deep, rumbling voice like thunder. It said something like, 'I'll take care of your belongings. In exchange, I'll let you live.'"

"We were hardly in the mood for talk," Tehm said into his wineglass. "And we weren't about to hand our belongings over to something hidden in the trees. Would that we had known better."

"I prepared a hold person spell, and Jonnel and Jubal drew steel," Katarine added. "Then the dragon showed itself, rising up and snapping a tree beneath its weight. It was barely a dagger's throw from us. We'd never even heard it."

"It was a green dragon, wasn't it?" Ster-

even heard it."

ling interrupted. "There's been word of one in this region for years, a greedy bully with a dark splash beneath one eye."

"That it was, the same one," Jubal replied, surprised. "We immediately covered our faces and stopped breathing, to save ourselves from its breath."

"And little help it was, too," Jonnel said. "It laughed and blew a cloud at us, thick green stuff that writhed as if it were solid. When it touched us, it stuck; the gas coated our armor and corroded it." He indicated his once-fine chain mail. "The gas seeped into our skins, and we became feverish and nauseated. It burned our eyes, making it difficult to see. When it got in our throats, we could barely talk. By some miracle, we all survived that first onslaught."¹

Tehm set his glass on the table but didn't look up. "Before we could act, the thing leapt into the air. For all its size, it was as graceful as a hawk. Beating its great wings to stay aloft, it demanded that we lay down our wealth, or it would breathe again. This time, we complied. We put our bags and backpacks in the clearing and backed away, seeking shelter in the foliage. Still, we did not want to lose our wealth, foolishly valuing it more than our lives. We circled the beast as it descended to inspect what we'd left. Katarine and I prepared spells; Jonnel and Jubal readied their weapons; and dear Melody climbed a tree to gain the best angle for her bow—she trusted luck and her skill."

Tehm's voice became inflectionless and distant. "The dragon was so engrossed in its gains that it wasn't paying attention to us. Melody planted an arrow deep in the dragon's side, and we gave it all we had. My magic missiles caused it to shriek in pain before Katarine magically silenced the beast so it would not be able to cast spells.² Jonnel and Jubal tried to close with it, but the thing arose from the forest floor; I was amazed that something so large could move so fast. I thought it was going to fly straight up so it could breathe on us again. Instead, it flew to the tree that Melody was in, snatched her from the branches with one great claw, and carried her aloft. In a moment, it was above the trees. . . ." He stopped, looking into the distance. When he spoke again, his voice was barely audible. "I ran into the clearing, trying to get it to come back."³

Jonnel laid a blistered but steady hand over the mage's trembling fist. "We all went a little crazy then," he said. "It sped away from us for a few moments, climbing higher and higher. As we watched, the

dragon slowed and turned.⁴ And soon it was back over the clearing; it looked like a bird, it was so far away. We scattered, spreading out so its breath weapon wouldn't catch us all. We watched from hiding, waiting for anything but what happened next." The fighter's voice faded now, too. "The dragon dropped Melody. She landed in the center of the clearing. Then the dragon flew away."

"We rushed out to her, Tehm and I," Katarine said after a pause. "It was no use. She was beyond aid. Jonnel and Jubal began to gather our possessions while keeping an eye out for the dragon. We picked Melody up and started to carry her to the cover of the trees when we heard Jonnel yell. The dragon was back; we hadn't thought it would return so quickly."⁵

Jonnel picked up the story. "I hollered a warning as the dragon plummeted to the clearing, landing on top of Katarine, Tehm, and Melody." Then it got up, turned toward us, and breathed again. We survived the attack and charged forward. We knew it could not breathe again so soon. We then charged—"

The stranger in the corner snorted, a big puff of smoke rising from his pipe. "Some fools say dragons must rest each time they breathe their poisons before unleashing another breath. But this is only what the survivors have reported. Those who failed to survive might have told a different story—that dragons can breathe more quickly than anyone would suppose."⁷

There was a brittle silence. The adventurers stared at the stranger as they fingered their wineglasses.

"At any rate," continued Jubal, "we knew it had but one more breath left within it, so it could not—"

"And some fools," the stranger snorted

**"It flew to the tree
that Melody was in, snatched
her from the branches
with one great claw, and
carried her aloft."**

again, his head wreathed in a gray-blue ring of pipe smoke, "think dragons can breathe only three times a day."

The stares that were given this time were long and cold.

"There is truth to what he says." Every-

one turned to Hypatia. "It sometimes happens that dragons can breathe again more quickly than their opponents believe possible. I have seen it happen. And some can, by resting, restore their breath weapons again in less than a day's time."

"In any event," Jubal said at last, "we charged the dragon, drawing it away from our two living comrades, who only had the wind knocked from them to go with their bruises. I decided to meet the dragon head on, while Jonnel went for its side. We figured this tactic would keep one of us safe from its bite. But the dragon lashed out with a wing, sending Jonnel spinning. I rushed to his aid without thinking, and I could almost feel the fiend's teeth as they snapped at my back. But Jonnel regained his footing unhindered, and we turned back to the fray, taking it from behind as it prepared to chew on our comrades."

The stranger peevishly tapped the ashes from his pipe. "Here comes another lesson in dragon fighting," he muttered.

Jubal's hand dropped to the pommel of his sword.

"Gods!" shouted Tehm, slamming down his glass in a spray of wine. His eyes burned as they fixed on the stranger. "Dare you mock us and our grief? Is your life so dull that you find comfort in courting your death?"

The patrons who had hoped for trouble now found they had been too hasty in

their wishes. They now sat with bloodless faces, not even daring to breathe.

"Hardly," returned the stranger, packing his pipe anew. "I've merely had the fortune, good or bad, to have gone on before you. So tell me, valiant fighter," he continued, gesturing to Jubal with his unlit pipe, "did it lash with its tail, or did you just get kicked?"

Tehm scowled silently and gulped the rest of his wine. He reached for the pitcher, but Katarine stopped him.

The color arose in Jubal's cheeks. "It kicked us," he said evenly.

"No insult intended," replied the stranger, "but you were fortunate. A dragon's tail can lash at anyone who isn't standing right at its root. A kick is preferable to that, at least."

"I would not trade for a worse blow than the one it gave us," Jubal said slowly. "I thought I had been struck by a battering ram."

"Your analogy is appropriate," Hypatia said suddenly. "But again, he is correct. A dragon's tail weighs many hundreds of pounds. A single slap from it can kill far more easily than could a kick. A few strokes of a tail, and this inn would be around our ears."⁸

"Forgive me," said the stranger, in a matter-of-fact tone, "but I'll wager that after you were kicked, you fought the dragon and slew it before it could breathe again. You skinned it, wrapped the hide in bundles, then came directly here."

"You are either a seer," said Tehm in a dangerously calm voice, "or you've been spying upon us."

"Not spying at all," replied the stranger. "We saw your friend Jonnel carrying the bundles, stiff with blood. Also, you were loaded with treasure; you admitted as much, and the sad burden you carried was obvious when you came up the road. With such a load as that, I doubt you would have gone anywhere else before you came here. I guessed the dragon did not breathe again because a dragon's foes do not usually survive if it can breathe more than once. Your courage and skill are not at question. You have merely discovered what many others have died learning—that dragons are terrible and versatile foes. I have shown it poorly, but you have my sincere respect. Please forgive my intrusions."

The adventurers seemed only slightly mollified by this, but appeared willing to let the stranger's rudeness drop. Several chairs scraped loudly across the floor as many of the tavern's patrons shoved themselves away from their tables and left the inn. Some were disappointed at the spoiling of the tale. Most were grateful to be alive. The innkeeper's face fell as he watched his customers go. The stranger only smiled. He then spoke a word, a tiny flame appeared on his forefinger, and he relit his pipe.

"I was not surprised to hear that you missed the dragon when it was lying in

wait for you," continued the stranger.

"Green dragons are bred for the forest.

Their color blends in with the foliage well, and they know it the forest as well as most elves. It's their territory, for which—as you saw—they will die defending."

Sterling nodded. "Some will die defending it. The dragon you fought was said to be young, and the battle you describe with it confirms this. I presume it picked the particular clearing you were in for its attack because there were small trees nearby—trees it could snap dramatically to make itself seem much bigger and more terrifying."

"But it was so large!" Tehm exclaimed. "Melody was like a tiny doll in its claws. And you call it young?"

"All dragons are large," Sterling said. "You were just lucky you fought one of the smaller ones. Based on the size of the bundles of skin you carried, and your estimate of its length, I would speculate that the dragon was probably a mere child. It stayed and fought to the end, indicating the foolishness of youth: It valued your treasure more than its life—a misconception that you said once belonged to you and your friends. Older and wiser dragons, although they covet treasure, understand the value of their enormous lifespans. They will flee from risky conflicts to seek less costly struggles later."

"And if you have considered going back to get the young wyrm's treasure," the old man added, "I wouldn't bother. Juvenile dragons usually don't have treasure—they're just starting out on their own. What treasure you carried might have made a nice start for it. On the other hand, the dragon might still have been living with one or both parents, and perhaps had other siblings. If that was the case, tracking it to its lair would only prove fatal for all of you."

"Yes," the stranger said, setting his pipe on the table. "Accept your loss and lick your wounds."

Tehm steepled his fingers and glanced at the stranger, whose face still remained hidden by the cloak. He then turned to the couple. "How is it that you know so much about dragons?"

Sterling laid his left arm on the table and rolled up the sleeve of his robe. "This," he said, as he indicated a long scar, "comes from an encounter with a blue dragon." He rolled the arm over, revealing a deeper, curved scar. "And this is a souvenir from a red dragon. Hypatia and I are . . . multi-talented, and we have a special interest in the doings of the evil serpents."

"How did you cross paths with the blue one?" Katarine queried.

"The tale is too long to tell. Let it suffice to say that a friend of mine had dragon trouble, and my young companion and I went to investigate it. It was in the desert many leagues to the west of here. We were forced to meet the fearsome beast in the open, as it is next to impossible to sneak up on a blue dragon. The tale of the

“You see, blue dragons—indeed, all dragons—leave little indication of their presence, hiding their passage by flying over the land or by manipulating the environment.”

battle is irrelevant. We killed it, of course; otherwise we would not be here. Blue dragons are loathe to let anything get away from them.”

“Please go on,” pressed Katarine. “We would do well to learn more of the tricks involved in dragon slaying.”

Hypatia and Sterling exchanged looks that no one could interpret.

“I would like to know more about dragon slaying myself,” said the stranger. “Such knowledge could only be of help.”

“Really?” the young woman said, turning to look at the stranger. Their eyes locked.

“Of help against evil dragons, of course,” the stranger said. “Share with us what you know.”

“It’s a bagatelle,” the old man said, moving his chair so his back was to the stranger. Hypatia didn’t move; her eyes bored into the stranger’s hood. The stranger returned the gaze and blew a lazy smoke ring, gold in color, that drifted to the adventurers’ table. The young woman broke it with an outstretched finger.

The old man scowled in disapproval at his companion. “Anyway,” he continued. “blue dragons are masters of ambush. Where green dragons scheme to bring all the creatures of the forest under their dominion, blue dragons seek to trap the unwary. They crave fresh meat and sudden victory. They use the arid deserts where they live to build their traps. Young dragons merely bury themselves in the sand, wait for something to get close enough, and strike as quickly as the lightning they breathe.”

“Dragons can dig?” Jubal queried.

“Oh, yes,” Sterling replied. “Several kinds of dragons can burrow, but only the young prefer it.” Older and craftier blue dragons soar over the desert for hours. When they spot prey, they watch it from a great height, being careful to stay hidden against the blinding sun. When the time is right, usually during the hottest part of the day, they strike. Many travelers have lost their pack animals and supplies to attacks like this. Afterward, the dragon continues to shadow any remaining victims, attacking again and again, sometimes charging from behind a dune in the dark of night, or lying in wait near water. You never know where you’ll find the dragon. It could be right in front of you.”

The stranger snorted as he puffed on his pipe, but he was smiling.

The young woman’s eyes slowly narrowed to slivers as she stared at the stranger. “What do you want from us?” she asked.

“Nothing whatsoever beyond your good will,” answered the stranger gallantly, almost cheerfully. “Pray, tell us more.”

The old man resumed, “Blue dragons use their environment, and the older ones can manipulate it. Some whip up great winds that cause sandstorms to blind travelers. The oldest of the dragons use illusions to change the appearance of the terrain. I once heard of a blue dragon who would burrow into the sand up to its eyes, then create an illusion of an oasis over it, complete with a glistening pool. As parched, unwary travelers approached, it rose up and breathed its lightning on them. These old dragons can also mask the terrain to cause travelers to lose their way. In some deserts where blue dragons are known to lair, maps are as valuable as water.”

“But what about the one you fought? Was it hard to find its lair?” Jonnel asked. “And is its skin worth anything?”

“I would think,” Katarine said, “that it would be pretty easy to tell where a dragon travels. All you have to do is follow its tracks and droppings.”

Hypatia started to speak, then stopped herself. A blush spread over her face.

Sterling sipped his wine and slowly shook his head. “Taking skins is barbaric—forgive me. But yes, we found its lair, and two younger dragons, which we quickly dispatched. We weren’t in the mood to subdue them.¹⁰ The lair was a horrid, evil place—not filled with droppings as most would think. Dragons are incredibly efficient creatures; nearly everything they eat is converted to raw energy. It was located amid grotesque rock formations, and ugly, pale desert fungus clung to the walls. There were small bits of bone and a few polished skulls, probably set about as macabre decoration. We stayed there only a short while, as long as was necessary to gather the gems, jewelry, trinkets, and gold. We left behind the copper, as it was not as valuable as the other items and was too voluminous to carry.”

“There was a big collection of marvelous blue sapphires,” Hypatia broke in. “There were too many of the exquisite gems for them to have been there by chance. The dragon must have been deliberately collecting them, sending agents to purchase or steal them, or demanding them as tribute. Perhaps all blue dragons covet them because of the similarity to their own color. Evil dragons are such vain and selfish creatures.”

The old man continued his tale. “We left the lair and returned home. The lair had been so difficult to find that I am certain no others stumbled upon it. You see, blue dragons—indeed, all dragons—leave little indication of their presence, hiding their

passage by flying over the land or by manipulating the environment. In most deserts, the sands are evershifting, quickly hiding a blue dragon’s tracks.

“All dragons’ lairs are virtually inaccessible to all but their inhabitants. Red dragons live on lonely mountain tops; black dragons make their lairs in dismal bogs; white dragons choose forbidding, icy wastes.”

“But no matter where the lairs are hidden, men will always search them out,” said the stranger. “Dragons aren’t the only creatures who are greedy and covetous. Every being on two legs looks forward to the day he can come to a place like this, stand tall, and say ‘I killed a dragon.’ Wealth and glory are powerful lures for any adventurer. Wouldn’t you agree?”

The stranger was looking at the adventurers, whose faces hardened as they guessed they were being mocked again.

“Enough is enough,” said Hypatia quietly.

The stranger nodded. “Still, on the subject of lairs, there are a few common factors they all share. All dragon lairs are isolated, as dragons like their privacy. Evil dragons look to the wealth they’ve accumulated for companionship. And as efficient as they are, they are voracious eaters. All natural creatures nearby quickly learn to avoid the dragon’s lair; those that don’t are just as quickly eaten.

“The area around an evil dragon’s lair exists in a state of arrested decay, while a good dragon’s abode is surrounded by a country that is both serene and beautiful. The entrances to the lair are always hard to find. The dragon will use all of its natural and magical abilities to hide them, and will use its intelligence and strength to create obstacles within the lair to trap trespassers. A well-concealed dragon’s lair cannot be seen until one treads upon the very threshold or wanders blindly into it. And a dragon is so linked to its lair that it can detect the presence of life within it; an older dragon can sense life beyond its lair.”

“Too true,” said Sterling. “A black dragon lying in its boggy lair can sense lizards scampering by on fallen trees. One such dragon sensed my companions and I paddling our boat through a reedy cypress swamp. When the noon sun beat down, a miasma rose and made it difficult to navigate or even breathe. We noticed a dark, clear spot to our right, where the cypresses, festooned with clinging vines, leaned over the water and formed a shady grotto. We paddled toward the grotto. It was quiet and calm, and without mist. We planned to rest awhile and perhaps fish. However, we had little time even for thinking. Crocodiles from the bank swam at us like a wave of soldiers going into battle. Spells were cast and arrows fired, but the crocodiles continued to close. Had we been less energetic in our defense, I dare say they would have upset the boat, or at least climbed into it. Yet, at the height of the attack, they were gone as suddenly as

they came. We were puzzled, as we did not believe our efforts would drive them away so quickly. We scanned the bank to make sure the crocodiles were not returning—but we were looking in the wrong direction. The boat surged, nearly pitching us into the water. We cast about wildly and found a massive, ink-black head towering above us. For a moment, it simply stared and looked amused. Before we could collect our scattered wits, it spat.”

“Spat?” said Katarine.

“A black dragon’s breath is a gout of caustic acid. This particular dragon’s acid dissolved just about everything it touched. My skin burned horribly. Needless to say, panic ensued. The majority of my companions stiffened with fear, staring at the beast as it raised a great claw and struck the boat, capsizing it and sending us all into the water. The few of us who could took to the air to combat it; the rest were forced to fight the wyrm in its own element. As the unfortunate few floundered in the fetid water, the dragon called back the crocodiles to join in the fray. Those of us in the air hurled missile weapons and spells—with little effect. Because the thing was so old and its hide so thick, normal missiles bounced off and fell into the dank water. Only some of our spells affected it. Mature dragons are resistant to magic, and this specimen’s magic resistance was very powerful. As we continued to fight it, the dragon summoned a swarm of insects that attacked our mage. Next, the venerable beast covered itself in absolute darkness. This caused our party much distress—at least until we dispelled the *dweomer*. The dragon, of course, was not hindered by the darkness in the least. It fouled our potions, cast spells at us, and dealt our party several fatalities. In the end, the dragon and its servants were killed. It cost us dearly, and we gained little pleasure from the beast’s passing.”

The old man sighed heavily. “It took us a few hours to find its lair—a cavern with a submerged entrance not far from where we fought it. The water around the lair was foul, black, and stagnant; it mirrored the dragon’s dark soul perfectly. Slimy moss clung to the sides of the cavern and coated the treasure. The treasure hoard was immense and comprised gold, silver, and copper coins. But the years and the sodden air had taken their toll on the wealth: The silver and copper coins were heavily tarnished.”

“Are all evil dragon lairs conspicuous by their gloom and ugliness?” Katarine asked.

The old man shrugged. “I have always found them so.” His companion nodded in agreement.

“On the other hand,” added the stranger in the corner, “ugliness, like beauty, is in the eye of the beholder. An overgrown thicket or weedy quagmire has its own kind of beauty, if you see it when you aren’t afraid for your life. To a closed mind, anything can be ugly.”

“I suppose so,” snapped Hypatia. “But I doubt you have ever found true beauty in or around an evil dragon’s lair.”

“Well,” the stranger returned. “That isn’t quite what I meant. You can’t find an evil dragon’s lair just by looking for the ugliest spot for miles. And even an evil dragon’s lair can be beautiful in the right circumstances. I remember seeing a white dragon’s lair in moonlight. The pale rays streamed into the cave’s mouth, making the icy walls look like sheets of diamonds. The blue light danced and scintillated on the heaped treasure like a great and chilly bonfire.”

“So you’ve fought a dragon, too?”

Katarine asked.

“As I said earlier, I’ve been there before.” The stranger laid down his pipe, folded his arms, and continued. “A few companions and I were walking across an ice floe tracking a large polar bear. A flock of raucous sea birds accompanied us on the chase. I knew things had gone bad when the sky turned silent. The birds had vanished as if by magic. My companions were pleased, certain that we were coming close to the bear. I looked around, scanning the sky for trouble as my companions spread out over the ice to look for our prey. Trouble came from beneath us.

“The dragon burst from the water like a bolt from a crossbow, breaking the surface in a spray of frigid droplets and slivers of ice. One edge of the floe was heaved into the air, and we tumbled toward the water as clumsily as children sliding down a snow-covered hill. Ice and dragon fell thunderously back into the water. As we scrambled on the slippery ice, the dragon lurched toward us. The ice teetered the other way, and we slid and tumbled toward the monster’s jaws. As we fought, the dragon’s thrashing tail smashed the ice beneath us to flinders, and we had to retreat to a larger floe or swim.

“It was like a game to the dragon. It gave us a taste of its breath, a blast of frost that chilled our blood and froze our sodden garments. Then it took to the air. This gave us a chance to ready a few spells and missile weapons, but it gave the dragon a chance to give us another ride. We had scattered in case of another breath attack, and it replied by plummeting onto me. I had been the last to flee from the melee and was thus closest to the water’s edge. When the impact came, it pulverized the ice around me and drove me into the water like a nail under a hammer. The blow flipped the floe like a coin.” I was stunned and battered, but I managed to survive the assault and escape to land

again. My magic saw me through.” The stranger picked up his pipe and examined it. “My companions were delayed from helping me, as a cloud of icy frost rose around them and blinded them.” Obviously, we won, but only after a long and dreadful battle.”

Jonnel looked at the stranger in disbelief. “How could you have survived such a thing?”

“Let’s say that, like these two—” he indicated Hypatia and Sterling “—I am multi-talented.”

Both Hypatia and Sterling stared at the stranger with new interest—and considerable doubt.

“I can’t think of anything worse than meeting some of the dragons that we’ve met,” said Katarine. “Nothing at all.”

“I can,” Sterling interjected. “Red dragons.”

The stranger gave a long nod, leaned back in his chair, and gestured for the old man to continue.

“All the dragons we have been discussing are evil. But there exists nothing more malicious, more basely malevolent than a red dragon,” Sterling said. “The dragon’s hatred burns hotter and brighter than its fiery breath, and its greed is perfect and complete. To a red dragon, wealth is as essential as air, and nearly as important as its vengeance.

“It was many years ago that I encountered my first red dragon. I did not yet fully realize the blackness of their souls, and I almost perished in the confrontation. I had grown fond of a small mountain village. I had friends there and often visited them. However, I grew restless and traveled far from the place, spending years roaming and exploring. When I returned, I found my quaint, idyllic village soiled with blood. A red dragon had moved into the area during my absence, and the villagers were giving young women to it so it would leave the village alone. In youthful outrage, I vowed to use all my magic and power to deal with the vile creature. A villager, one of my closest friends, said he had seen the dragon and would guide me there. He offered to disguise me as another villager so I could find its strengths and weaknesses.

“Unfortunately, the red dragon had found mine. It had *charmed* my friend and compelled him to lead me right up the mountain and into a trap.” He paused, leveled his gaze at the stranger, and continued. “The dragon was old and wise. It had several spells and years worth of cunningly crafted battle plans. As we climbed the mountainside, the dragon

“The boat surged, nearly pitching us into the water. We cast about wildly and found a massive, ink-black head towering above us.”

“The mountain shook as we fought. The red dragon was large, and in its thrashing, it was bringing its own lair crashing down around us.”

turned a portion of the rock beneath our feet to mud. Then it showed itself and threatened my companion. I rushed to my companion's side to protect him. The dragon breathed its blistering fire at us both. Only I remained standing. I struggled a long time to get free of the mud, and began climbing to the outcropping where the dragon had shown itself. It was waiting for me. The foul beast breathed twice more as I moved forward and fought it. It spoke, gloating about the village it held in thrall and the succulent villagers on which it fed. It considered everything in its sight its domain, and all living things in its domain its subjects.

“Although I was severely wounded, I began to get the best of the dragon. It retreated into its lair, and I followed, casting spells. It had a considerable resistance to magic, but some of my spells got through. Its anger grew a thousandfold as its prey became its hunter. I believe it was the dragon's anger that proved its undoing. In its blood-red rage, it grew sloppy. The mountain shook as we fought. The red dragon was large, and in its thrashing, it was bringing its own lair crashing down around us. When an opening in the rocks appeared, it pushed the fight outside again and into the air over the village. It was trying to escape me, but I wouldn't let it. As I struck the dragon with a killing blow, I saw the villagers below watching the terrifying spectacle. Then I watched a spectacle, too. With its dying, vengeful breath, the red dragon breathed on the crowd, then fell lifeless onto the roofs of several homes.

“Despite all the treasure that I knew it must have accumulated, I didn't return to its lair. I was so repulsed by the dragon that I left the treasure to the villagers. My friends were all dead. I never went back.”

The old man pushed himself away from the table and glanced at Hypatia and the stranger. “There's no more to tell,” he said. “I've fought no other species of dragons.”

“It's late,” the young woman said. “We should be going.”

Sterling nodded and got to his feet. The adventurers bid the couple their good-byes and best wishes, then watched as the two walked to the door. The stranger got up and walked with them, having said nothing since Sterling's last story.

“What did you think?” Tehm asked under his breath.

“Didn't believe much of that Sterling's tale,” said Jonnel. “Even an old wizard-warrior isn't going to best a red dragon one on one. I've heard about those dragons, too.”

Outside the inn's door, the couple and the stranger looked at the quiet landscape as they walked a short distance from the inn. Crickets chirped around them, and night birds called.

“So you know us, then,” said Hypatia suddenly. “What kept you from telling everyone?”

The stranger chuckled. “It would have served no purpose but to have frightened the people. And you were in the presence of real, live, vengeful dragon slayers, who might have felt the need to have defended themselves. Better to let the matter drop.”

“How did you know?” asked Sterling.

The stranger smiled at him. “The way you spoke. Only a dragon would call the taking of dragon hides barbaric. Only a dragon—a silver one, I might add—could fight a red dragon down, as its frigid breath would harm the red one more terribly than any other dragon's breath. Things like that. And your human name, Sterling, was a cute pun. Sterling silver, after the coin some humans use. Your companion was more practical.”

Sterling smiled ruefully. “An old dragon must have his joke. Makes the world a brighter place.”

“Indeed,” agreed the stranger. “An old dragon must have his joke. And I have had mine as well.”

Hypatia stared hard at the stranger. “No,” she said.

“Yes,” said the stranger. “I believe the human children have a saying that goes, ‘It takes one to know one.’ They also say, ‘Where you find silver . . . you also find gold.’”

Hypatia gasped. Sterling merely stared, open mouthed. Then they both broke into smiles as broad as the stranger's, and the laughter of the three echoed across the valley and into the night.

Footnotes

All of the following notes apply to the AD&D® 2nd Edition game rules and are designed to mesh with the descriptions of the dragons given in the first *Monstrous Compendium*. Though some of this material is official, much of it is unofficial but supplemental, useful for making your dragons even tougher.

1. Cloudlike breath weapons, such as the green dragon's chlorine gas, cannot be negated by a victim who takes the naive precaution of covering his nose and mouth. The damage is not accrued solely by inhaling the gas; the gas is absorbed into the victim's system through the skin.

Clothing and armor afford no extra protection, as the gas can seep through these. Even a *necklace of adaptation* is ineffective, since the gas works on contact.

2. Dragons do not need verbal or somatic components to cast spells. Such spells are cast at will. *Silencing* a dragon will not prevent it from casting spells.

3. This was a *snatch attack*. A dragon can only snatch a creature that is two size classes smaller than it is, so the dragon in the story would have been a huge creature at least (over 12' long). A snatch attack can only be made against one being per round while the dragon is in flight.

4. Because dragons are graceful and competent fliers, they can each fly at three different speeds. The slower they fly, the better their maneuverability classes. The flying speeds and maneuverability classes of black, blue, green, and red dragons are: 18 (C), 24 (D), and 30 (E). White dragons have greater flying speeds: 20 (C), 30 (D), and 40 (E).

5. The dragon undoubtedly performed a *wingover*. A dragon carrying a rider or snatched victim cannot perform a *wingover* unless the creature or creatures carried are at least three size classes smaller than it is.

6. A dragon which is airborne or is at least 30' above a target can *plummet*, inflicting crushing damage equivalent to its bite when it strikes. Using this method of combat, the dragon can crush as many creatures as its 2nd Edition combat modifier indicates. The dragon rolls a separate attack against each intended victim; creatures that are missed are assumed to have escaped. Creatures that are crushed must save vs. petrification or be pinned under the dragon, automatically suffering crushing damage the following melee round. If the dragon chooses to maintain the pin, the victim must save vs. petrification to get free. Pinned creatures take crushing damage each minute until they get free. The dragon's combat modifier applies as a bonus or penalty to all saving throws vs. the crush. A dragon cannot take any other actions while plummeting or pinning, except to bite at pinned victims (at a +2 bonus to hit, biting at one victim per round) or to breathe. If the dragon does anything else, all victims of its crushing attack are set free.

7. When a dragon breathes, it cannot send out its breath weapon again for 1-3 minutes. Roll 1d6: A roll of 1-2 indicates that the dragon can breathe in the next melee round; 3-4 indicates that the dragon can breathe again on the second round following the breath; and 5-6 indicates that the dragon can breathe on the third round following the breath. Allowing a delay will allow PCs a better survival chance against dragons, but it is optional.

All dragons can use their breath weapons three times before they must rest to regenerate the energy for further breaths. Sleeping 1-4 hours restores the energy to

generate one breath weapon, and an additional 1-4 hours restores both of the remaining breath attacks simultaneously. However, most dragons do not automatically wake up after after regaining their three breath weapons. After the minimum 2-8 hours, a dragon will always sleep an additional 1-20 hours minus its intelligence score (treat negative results as zero additional hours). If the dragon is awakened during the extended sleep period, it suffers no ill effects. If a dragon tries to sleep and regain breath weapons more than once during any 24-hour period, the time required is doubled (2-8 hours for the first breath weapon, an additional 2-8 hours for the two remaining breaths, and 2-40 hours minus the dragon's intelligence score for extended sleep).

8. A dragon's tail is an awesome weapon. A number of creatures equal to one-half the dragon's age category may be struck by the tail (round fractions down to a minimum of one creature). For example, a juvenile dragon can strike two creatures with its tail; a great wyrm can strike six. The tail can strike creatures standing behind the dragon or to the side of the dragon as far toward the head as the dragon's wings. Creatures standing within 5' of the tail's root (the point where the tail joins the dragon's body) cannot be lashed with the tail. In one combat round, the dragon can sweep its tail from right to left or left to right; it cannot do both. (Thus, all the targets must be on the same side of the dragon.)

9. Dragons which can burrow are limited to burrowing in their preferred environment. For example, only blue dragons can burrow in sand, and only white dragons can burrow in snow or ice.

10. Dragons can be attacked with the intent of killing or subduing them. All dragons except silver and gold can be subdued. (Brass dragons also are immune under certain circumstances.) The attack form must be announced prior to melee; otherwise, the attack is assumed to be with intent to kill. Only creatures with an average intelligence (8-10) or greater can attack to subdue. In subdual combat, all damage is of a battering or bruising nature. However, the dragon can die if the subdual damage inflicted is equal to two times its hit points. Attackers must do more subdual damage than the dragon has hit points before there is a chance to subdue. For every 1% of subdual damage inflicted over the dragon's hit points, there is a 1% chance to subdue. DMs should check for subdual at the end of every minute of combat. (Subdual damage is not mentioned in the 2nd Edition rules.)

If a dragon is subdued in melee, the dragon will not necessarily remain subdued for an extended period. A dragon will attempt to get away from its master when it believes it can do so without endangering its life. How soon a dragon attempts to escape depends on how it is

treated. Evil dragons will never serve a good master for long; neither will good dragons serve evil masters for long.

Subdued dragons are valuable and can be used as mounts. Such dragons can usually be sold for 100-800 gp per hit point.

11. This is an unusual attack method for white dragons. Because white dragons are limited in intelligence, only the oldest of these dragons will have developed such ruthless and cunning tactics, or have the ability to pick out ice floes that can be flipped over.

12. The duration of a white dragon's *freezing fog* is based on its age. A wyrm's *freezing fog* lasts for 16 rounds, while a great wyrm's lasts for 17 rounds. See details as given in the 2nd Edition *Monstrous Compendium*.

ECOLOGY OF THE DRAGONBORN

illustrations by Brian Hagan and William O'Connor

HISTORY

Myths speak of the birth of the dragonborn, though they differ in the telling. Tales, awe-inspiring and terrifying, tell of the rise and fall of dragonborn empires, the greatest among them lost to a war that is still remembered. And modern dragonborn live according to their heritage, more than one aiming to carve an eternal story into the world's chronicles.

Several legends say that Io, the greatest dragon god, shaped the dragonborn as servants to dragons at the same time he created the first dragons. Elemental essence and astral spirit went into the making, as with all worldly creatures, but like their greater kin, dragonborn were given a balance favoring the elemental.

Other tales claim that Io died in the clashes between the gods and the primordials. The draconic gods Tiamat and Bahamut emerged from the halves of Io's sundered corpse. Dragonborn sprang, ready to serve dragons, from Io's spilled blood.

Timing of dragonborn genesis aside, Tiamat and Bahamut were instantly at odds. As soon as the war against the primordials ended in the gods' favor, these siblings began a struggle for dominance over dragonkind that has lasted into the present age. Many dragons and dragonborn took sides. Some turned to Tiamat's ways, others to Bahamut's, but a plurality walked a path between the two extremes.

Dragonborn families formed clans, extended groups unified by geographic proximity and similar temperaments. A large number of clans dedicated themselves to serving dragons. Many of these dragons belonged to bloodlines on one side or the other of the war between Bahamut and Tiamat. Others were autonomous wyrms who guided and nurtured their dragonborn followers. And still other dragonborn families, sometimes after the loss of a dragon patron, formed clan ties independent of dragons. These unified clans had military discipline in common, which was a trait needed in ongoing war or for mere defense in the elder world.

From within this clan structure, the dragonborn and their dragon lords formed centralized, cooperative states. They developed codified laws, as well as civic and religious institutions. War and diplomacy further unified realms. Dragonborn nations waxed and waned. All along, the conflict between the dragon gods did the same.

Historians, dragonborn and otherwise, differ on the subject of the outcome of the draconic conflict. A few claim that Bahamut's forces won in that early age. More say that moderate dragonborn came to the fore, forcing divine agendas into a secondary position related to worldly matters. The likeliest scenario is that the unaligned among the dragonborn showed a

preference for heroic and kindly values, as common folk often do. This esteem placed Bahamut's followers in an advantageous position, allowing them to persevere over their adversaries. At the same time, the needs of mortal creatures took precedence over the machinations of immortals.

Regardless of the truth of the matter, after numerous dragonborn kingdoms had passed into forgotten history, a unified array of dragonborn city-states formed the storied empire of Arkhosia. Dragon nobles integrated under a dragon emperor, mythically dubbed the Golden One. A dragonborn bureaucracy supported the nobles, protected by a military headed at first by the general Surina Moonscale. The Golden One and mighty Moonscale held Bahamut in highest regard among the gods, and this faith helped establish central principles for the empire.

Imperial priests also held strongly to the tenets of Erathis, Ioun, and Kord. The empire expanded its territory with a goal of bringing civilization, knowledge, and safety to untamed places and ignorant peoples. It gained land as much through word, trade, and decency as it did through battle. Within mere centuries, Arkhosia ruled large portions of the known realms.

Arkhosia seemed to be an unstoppable taming force that would eventually span the world, bringing progress and a measure of uprightness with it. Even Tiamat's worship was outlawed and forced into secrecy. But evil other than Tiamat's had risen to power in lands distant from Arkhosia's central regions. Eventually, the expanding borders of the fiendish kingdom of Bael Turath, ruled by tieflings and devils, collided with those of Arkhosia.

Ideology, culture, and ambition smashed together as well. No common ground could be found between the two empires. For one to succeed, the other had to fall. War was inescapable. It came swiftly and brutally, and it spanned hundreds of years.

Both sides suffered internal strife, mirroring the surface conflict. Tiamat's cult wormed away inside Arkhosia, weakening it. The desire of common folk to be free of infernal shackles poisoned Bael Turath's well of power. Bane's cult worked both sides, stoking the war hotter, while extremists loyal to Melora aimed to bring both empires down. Bitterness strengthened the utter incompatibility of ethos between the two nations.

Ever worse exchanges led the warring empires toward ruin. Bael Turath's forces heaped atrocities upon Arkhosia, corrupting some lands to the point that neither side could hope to reclaim them. Many of Arkhosia's stalwarts of Bahamut began to thirst for retribution more than justice, to look to vengeance more than protecting the defenseless. Bloody Arkhosian campaigns against Bael Turath led some idealistic Arkhosians to doubt, and the empire's foundational beliefs faltered, causing political turmoil. Overextension of resources made it difficult for ironhanded Bael Turath to keep order in its core provinces.

Neither relented, eventually costing both everything. The Golden One and many dragon lords perished, some fleeing with their lives but without honor after the death of the dragon emperor. Lesser lords of the Nine Hells strode across battlefields, only to fall to draconic claws or the assaults of Arkhosia's legions. That which didn't disintegrate in direct combat crumbled under the stress inflicted by the seemingly endless and vicious war. But end that war did, when neither empire had the resources or the will left to fight. When the dust settled and the smoke cleared, Bael Turath and Arkhosia were no more.

Fiends of Bael Turath that weren't hurled back into the Hells hid among the ruins, and Arkhosia's few remaining dragon lords abandoned the wreckage or squabbled over the remains. Tieflings and dragonborn alike were left with no choice but to largely abandon their lands in search of refuge elsewhere in the world.

Most present-day dragonborn are integrated into mixed societies and are living in lands they cannot claim as their own. A few clans, as well as many individuals, roam in search of worthy causes, or simple wealth and personal glory. All continue to venerate the dragonborn model set forth in centuries-gone Arkhosia, making their way according to a high personal standard.

KNOWLEDGE OF THE DRAGONBORN

Arcana

DC 25: Legend tells that dragonborn are a balance of astral and elemental essences, weighted more heavily toward the elemental like the great dragons are.

Dungeoneering

DC 20: The end came so fast for parts of Arkhosia, such as Serpentis Rift, that valuable draconic and dragonborn relics are buried there to this day. In other places, such as the fortress Razortear, fiendish and draconic remains mix as a testament to the fortunes of bygone wars. In any such place, one can expect creatures of the wilderness, dangerous old magic, and trapped or hidden fiends.

History

DC 15: Dragonborn once possessed a massive empire named Arkhosia. War against the tiefling realm of Bael Turath led to the ruin of both kingdoms. Now, the dragonborn consider no civilized place their native soil.

DC 20: Dragons ruled Arkhosia. The dragonborn served them. Theirs was a sophisticated realm, and the clash with Bael Turath was a war of progressive

civilization against oppressive tyranny.

DC 25+: Fine details of the Arkhosia and its war against Bael Turath are master-level pieces of knowledge.

Nature

For nondragonborn, the general traits of the dragonborn are common knowledge. Details of their life cycle, inner physiology, and development, as well as the intricacies of their society are expert knowledge.

Religion

DC 15: Dragonborn have strong ties to the draconic gods, Bahamut and Tiamat. Bahamut's worshipers are more numerous and bold, but Tiamat's followers still thrive in the shadows.

DC 20: The dragonborn of Arkhosia also venerated Erathis, Ioun, and Kord—civilization, knowledge and prophecy, and battle.

DC 25+: Dragonborn creation myths and the ongoing conflict between Bahamut and Tiamat are master-level pieces of knowledge.

PHYSIOLOGY

Imposing, strong, and draconic, dragonborn cut an impressive figure among other humanoid. An average dragonborn is tall and strapping compared to the normal human, although the basic shape is the same. Also distinctive from human counterparts is a dragonborn's dragonlike head, scales, fangs, and claws.

Despite a passing resemblance to reptilian creatures, dragonborn are warm-blooded beings rather than cold-blooded reptiles. Their bodies are hot enough to seem feverish to human sensibilities. This keeps a dragonborn more comfortable in cold temperatures. A lack of body hair coupled with a large mouth that can be opened to release body heat means that a dragonborn is no more vulnerable to hot temperatures than a human.

The scales that cover a dragonborn are tougher than human skin. Although these scales make a dragonborn less susceptible to small, incidental wounds, they don't protect against damage dealt by weapons and similar purposeful attack. Dragonborn

also typically lack the inborn elemental resistances true dragons might possess.

Like true dragons, however, dragonborn hatch from eggs, usually laid singly or, more rarely, in a pair. Hatchlings are quickly capable of standing and walking, but their teeth take a few months to come in. During this time, the mother nurses her offspring. She slowly weans the child to soft and then normal food, which for dragonborn is usually more meat than other edibles.

By the end of the first year, a dragonborn hatchling has the mental and physical development of a 3-year-old human child. A dragonborn matures quickly throughout his or her youthful development. At about 12 years of age, the dragonborn is a lanky version of his or her adult self. Over the next 3 years, he or she fills out into an imposing adult form.

A likeness to dragons gives dragonborn physical might. Dragonborn also carry an almost supernatural bodily potential to tap into and develop draconic traits. Most develop a breath weapon, which is dangerous by the time a dragonborn reaches adulthood. Still, an individual dragonborn might manifest more draconic traits than another. One might do so at birth. Such a change could instead come as the dragonborn's soul quickens in the crucible of a spiritual path or as the body adapts in the wake of mighty deeds.

NEW DRAGONBORN FEATS

The feats in this section are divided into heroic tier and paragon tier sections.

HEROIC TIER FEATS

Any feat in this section is available to a dragonborn character of any level who meets the prerequisites.

ADAPTABLE BREATH [DRAGONBORN]

Prerequisites: Dragonborn, *dragon breath* racial power

Benefit: Choose a damage type your breath weapon doesn't already have from among acid, cold, fire, lightning, or poison. When you use your *dragon breath* racial power, you choose which damage type applies to the attack. Only one damage type applies for a given *dragon breath* attack.

Special: You can take this feat more than once. Each time you select this feat, choose another damage type for your *dragon breath* power that you don't already have for it.

HURL BREATH [DRAGONBORN]

Prerequisites: Dragonborn, *dragon breath* racial power

Benefit: When you use your *dragon breath* power, you can hurl it as an area attack instead of using it as a close blast. You create an orb of energy that explodes in a burst 2 with a range of 10 squares.

PARAGON TIER FEATS

Any feat in this section is available to a dragonborn character of 11th level or higher who meets the prerequisites.

ADMIXTURE BREATH [DRAGONBORN]

Prerequisites: Dragonborn, *dragon breath* racial power, *Adaptable Breath*

Benefit: When you use your *dragon breath* power, you can mix any two of the damage types to which you have access. Your *dragon breath* deals both types of damage. This doesn't increase the amount of damage you deal, but a creature must be able to resist or be immune to both damage types to reduce or ignore the damage. If a creature is vulnerable to either damage type, it is considered to be vulnerable to damage from your *dragon breath*.

For instance, if you chose the fire damage type at character creation and chose lightning when you took the *Adaptable Breath* feat, your *dragon breath* deals fire damage and lightning damage. A creature immune to fire but vulnerable to lightning is considered to be vulnerable to your *dragon breath*.

DRAGONBORN ZEAL [DRAGONBORN]

Prerequisites: Dragonborn, *Dragonborn Frenzy*, *Great Fortitude*, *Toughness*

Benefit: The *dragonborn zeal* racial utility power replaces one of your utility powers. The power it replaces must be 12th level or higher. If you do not yet have a power of 12th level or higher, you can replace the appropriate power when you gain it.

Also, when you use your second wind, you can choose to gain a +1 bonus to attack rolls until the end of your next turn in addition to the defense bonus typically granted for a second wind.

Dragonborn Zeal Paragon Dragonborn Racial Utility

Your wounds sometimes make you relentless.

Daily ♦ **Healing**

Immediate Reaction **Personal**

Trigger: Your hit points drop to 0 or fewer

Effect: You regain hit points equal to your healing surge value plus your Charisma modifier. Add your Charisma modifier as a power bonus to your attack rolls and damage rolls against the enemy that reduced you to 0 hit points or fewer until the end of your next turn.

PSYCHOLOGY

Dragonborn psychology centers on a draconic nature tempered by strong cultural ideals. The inner draconic spark is expressed as intensity coupled with a well-developed sense of self. From this sprouts a resolve born of an honest desire to be the best one can be and to be worthy of one's heritage. Tradition

focuses the dragonborn ego with principles of personal excellence, accountability, honor, and wisdom.

Strongly emotional, dragonborn approach life with a natural enthusiasm. Passion comes easily, and dragonborn readily invest themselves in the tasks set before them. At its simplest and perhaps basest level, this fervor expresses itself in extremes of feeling—dragonborn don't hide anger or joy. Such emotion also surfaces as ferocity in battle, especially when dragonborn feel their resolve faltering. When failure comes into view as a possibility, dragonborn become more tenacious.

This is partly because a healthy self-image is common among dragonborn. Few dragonborn are timid or reserved, except as a matter of showing proper respect to others. Guided by personal morals, dragonborn look out for themselves, along with those creatures and items they value. They have no trouble asking for what they need or taking time to improve their abilities. And they expect others to do the same. How else can associates and friends rely on one another? In what other way can society be expected to function?

The paradox in the dragonborn belief in a strong group dynamic is that, like dragons, all dragonborn are fiercely independent. They learn to be so in their upbringing, focused as it is on individuality. So this conviction is an outgrowth of personal pride. Dragonborn see the strengths of a group they are part of as an expression of their own strengths. The group's failures and successes become those of the dragonborn members within it, reflecting on them and their choice to be a part of the group.

Coupled with such pride, dragonborn carry a high personal standard. When a challenge comes, dragonborn rise to it. They set their sights on success and keep going until no options remain to prevent failure. This trait isn't as simple as a disdain for flaws and lack of success. Dragonborn want to contribute and to be seen as valuable by those they value. They

consistently want to show that their confidence in themselves and the reliance others have on them isn't misplaced. Consideration of how they can become better at whatever they do, whether by further fortifying assets or shoring up weaknesses, is part of dragonborn thinking.

Responsibility is also a piece of the dragonborn mindset. This can be an expression of their attachment to others involved in a situation. It's also attributable to the cultural value placed on respect, for self and others, and good judgment. No dragonborn gives his or her word lightly. In fact, dragonborn often value honoring their promises and fulfilling their obligations more than their lives.

Good judgment is, therefore, required of dragonborn. They must assess the options before them and make the best choice. A failure to do so is just that—failure.

As an expression of all these personality aspects, any dragonborn aware of his or her abilities might realize he or she can't hope to succeed in certain circumstances. Dragonborn show wisdom by not giving their oaths to accomplish what they know they can't. They show virtue by admitting their sense of the state of affairs and offering to help as best they can. They show courage by trying to accomplish the impossible anyway, when the cost of inaction would otherwise be too great.

Such positive expressions of dragonborn nature are common especially among heroic dragonborn. But, as with all fallible creatures, negative expressions also abound. Passion can lead dragonborn to brutality, hasty decisions, and unrighteous vengeance. Greed and worse forms of selfishness can grow from a misguided ego. Blind ambition can follow a commitment to excellence, as can a willingness to evaluate others severely or to undertake foolhardy deeds.

Although such twisting of virtue can be a seed of wickedness, most of the time it never goes so far. An individual dragonborn might not see some of his or her failings, but such negative behavior never truly descends into evil. And a lot of dragonborn villains

display a subset of dragonborn scruples, especially courtesy and respect to enemies.

CULTURE

Dragonborn trace their modern cultural leanings to the hale days of Arkhosia, when the precepts of dignity and progress were paramount in the dragonborn mindset. In Arkhosia, strong clans arose and formed ties that yet endure among dragonborn bloodlines. Within that lost empire, dragonborn knew their greatest glory and became instilled with an everlasting sense of their place in the world. War with Bael

Turath and the loss of Arkhosia served to hone dragonborn into what they are today.

CLAN

Clans and family bloodlines are still preserved among the dragonborn, and both are important. The difference between the two is subtle. Family is defined by one's actual blood relatives as far back as records go. Clan is a federation of families, unified in the annals of time, often for forgotten ends.

All dragonborn revere their honored ancestors, family, and clan. They perform their work with an eye toward what their deeds say about their lineage. Such ties can define peace and enmity, as well as cooperation or antagonism, among individual dragonborn. Families and clans have reputations, good or ill, that can have little to do with the living scions of the bloodline.

The desire to live up to a laudable legacy or overcome a besmirched birthright can define a dragonborn's life. Some dragonborn instead embrace infamy or flee from the responsibility imposed by the past. Others make their way according to personal values, perhaps aiming at becoming the most capable and admired dragonborn among the elders of a clan, thereby becoming the clanmaster.

When doing so is possible, all dragonborn of a particular clan look to their clanmaster for guidance. Clan elders have ways to contact a distant clanmaster. The clanmaster also has loyal dragonborn agents to act in his or her stead, and to serve as messengers.

Keeping contact can be difficult, but dragonborn of the same clan more easily form cohesive coalitions and enclaves. Marriages are defined by age-old pacts among clans. Dragonborn parents with weighty responsibilities look to such relations for help fostering children. A whole ward in a large settlement might be filled with dragonborn from allied clans, and each clan could have its own hall like in the old days of Arkhosia.

DRAGONBORN NAMES

Dragonborn have personal names, given at birth, as described in the *Player's Handbook*. They can also have childhood names, family names, and clan names. All these come according to a dragonborn's heritage and place in dragonborn society.

A childhood name or nickname is common. Such a name is usually descriptive, and it serves as a term of endearment or encouragement for a young dragonborn. The name might recall an event or center on a habit. It could derive from an ancestor that acted similarly to a child, or a favored toy or item might be the inspiration. Such names are seldom appropriate for adults. For anyone to use such a name without proper authority, such as that of a parent or elder, or without permission is a sign of disrespect. A dragonborn's elders use a childhood name after that dragonborn becomes an adult only to indicate disapproval.

Childhood Names: Climber, Earbender, Leaper, Pious, Little Kriv, Shieldbiter, Zealous.

Family names are Draconic words, much like given names, carried by a specific bloodline. They often come from the deeds of an ancient scion of the family

line or an amalgamation of the names of notable ancient ancestors. A dragonborn seldom identifies itself by family name, unless specificity is required. Dragonborn keep their family names private except among close friends, and instead go by clan name.

Family Names: Alreja, Bhergav, Duggal, Garodya, Iyotar, Letrah, Mulhotra, Odeyar, Pradhu, Reddyar, Samanga, Tyagi, Ulharej, Vadula, Yadav, Zaveri.

Clan names are ancient titles that are frequently taken from the names of dragon lords of Arkhosia. Those that aren't dragon names are names of trade associations or martial cadres, much like modern guilds, arcane societies, or knightly orders. A dragonborn goes by his clan name, so his deeds are known to reflect on that clan. Members of a clan fiercely defend their clan name against misuse, and some dragonborn outlaws are stripped of the privilege of using the clan name.

Clan Names: Bloodbane, Drakerider, Flamebrow, Hammerwing, Loremark, Moonscale, Peaceblade, Redmark, Silverspear, Spellscale, Warbringer.

FAMILY

All this focus on clan comes from the fact that, while family bloodlines can be extensive, the dragonborn family unit is very small. The typical one contains only two dragonborn: a mated pair, or a parent and child.

Dragonborn wed to procreate. Although notable exceptions exist to this generality, wedlock ends as soon as the offspring from a union is 3 years old. If the parents have no reason to maintain proximity, one of them, usually of the same gender as the child,

raises and trains that youngster in the ways of people, family, and clan.

Honor demands that a parent teach a child well, and that adults care for the young. Through storytelling, tutoring, and demonstration, the parent instills virtues and skills in the child. Although this process serves to educate, it also gives the youngster's fiery spirit a focus. Without such direction, the fierce nature of a dragonborn comes to the fore, resulting in ferocious savagery.

When rightly trained in dragonborn ways, however, a juvenile learns that honor requires respect for elders and other worthies, focused and sincere effort, reliability and fulfillment of oaths, and integrity. At an early age, he or she understands that chosen actions can bring credit or disgrace to self, family and clan, and even all dragonborn. Even dragonborn crafters and laborers grow up with discipline, play inspired by lessons and tales of derring-do, and an admiration for brave and principled deeds. All learn a thing or two about fighting and soldierly ways. They learn to be bold so that they can challenge themselves and those who misuse authority.

Where dragonborn are a small portion of the local population, which is the norm, such tiny families are common. But where an integrated enclave exists, the process is different, and some dragonborn claim, resembles what life was like in Arkhosia. In such a community, dragonborn foster children communally. Adults watch out for and teach the young, and the young enjoy a broader exposure to an array of dragonborn role models. A single parent still maintains authority and responsibility for a youngster, but in these situations, the other parent is often close at hand and has some influence as well.

ADULTHOOD

Independence is nurtured in dragonborn youth at every turn. When, at 15 years old, dragonborn adolescents transition into adulthood, they are expected to

have integrated the teachings of their childhood into their conduct. They have a healthy respect for capable individuals of all races, even those they oppose. Their esteem for themselves and their forebears guides them in all they do. Responsibility for their actions transitions from them and their parents to each individual alone, even though a dragonborn's deeds reflect on upbringing and heritage.

Principled behavior and instilled daring mean dragonborn adults are different from their counterparts among other peoples. Dragonborn society produces fewer petty criminals, but more outright villains—dragonborn are more likely to be bandit lords than pickpockets. Conversely, dragonborn are numerous among adventurers. They also find places more regularly in the company of those who have unusual or specialized skills, artistic or venturesome.

Regardless of what they do, whether among other dragonborn or not, dragonborn are conscious of how they are responsible for what they do. A dragonborn weaponsmith aims to be the best, to push the boundaries of his craft, to sell weapons in a scrupulous manner, and to honor those who use his armaments by creating implements of worth. The dragonborn soldier, in turn, honors armorer, commander, and clan, by performing his or her duties well. He or she does so by taking initiative in training and on the battlefield, and by helping comrades. Failing to recognize such interconnectivity is a failing of character. This system of honor with awareness and answerability was the strength of the dragonborn when, in Arkhosia, they served dragons.

DRAGONS

Today's dragonborn serve dragons as an exception rather than a rule. Some clans still remember the last days of Arkhosia, when the selfishness and cowardice of some dragon lords became all too visible. Dragonborn from these bloodlines might despise dragons. Other clans still hold dragons in esteem, weighing a

dragon's worth by its actions. Most clans remain free from draconic influence. Those few dragonborn who serve dragons are often more barbaric than their kin who live among humans and other races.

MAGIC

Dragonborn have ancient traditions of magic, focusing on war, as well as divine, draconic, and elemental forces. As fierce as a dragonborn's heart, magic among the dragonborn is seldom bent to mundane tasks. It is a weapon of the mighty.

Despite a natural talent for the arts of the warlock, typical dragonborn prefer an arcane path that doesn't tie them to forces outside themselves. Wizards and sorcerers are notorious for their secretive and eccentric ways, which makes the professions attractive to dragonborn. Further, the powers of the wizard and sorcerer are dragonlike in their primordial fury. Many clans have wizardly ways passed down through numerous families among them since the time of Arkhosia. These things said, sometimes the warlock's road is an acceptable expression of individualism or the last resort of an outcast.

Dragonborn truly favor divine powers, especially those of the paladin. Investing oneself in the tenets of a faith gives direction and purpose, something many dragonborn crave. Although doing so ties a dragonborn to a deity or church, it carries little to none of the stigma attached to the eldritch ways of the warlock. And the paladin's obligation is to stand in the vanguard of a church's defenders, which is the perfect place for a being that has a martial spirit.

RELIGION

Faith is a personal matter for each dragonborn, and it is an issue in which the dragon deities take prominence. Bahamut is most important among the dragonborn people, but Tiamat's cult thrives well in the hearts of avaricious dragonborn. Erathis, Ioun, and Kord also remain important as symbols of advancement and a progressive, fighting spirit.

Bereft of their own temples, most dragonborn practice religion in churches within mixed communities. They participate in few rites, unless duty, such as that placed on a cleric or paladin, or respect, such as that for a devout friend, compels them to do so. Clan elders preside over dragonborn marriages and funeral rites, for instance; absent these, family and close friends participate. Although gods might be invoked at such ceremonies, to call such rites religious would be a mistake.

ART

Dragonborn are practical and meticulous about their crafts. Like dwarves, they create few items for purely artistic reasons, preferring the coupling of functionality and beauty. Strong individuality among dragonborn causes them to focus more on personal items, such as weapons, rather than those that can't be carried, such as architecture or statuary. One exception to this generality of usability and beauty exists in the case of jewelry.

EVOLUTION OF THE DRAGONBORN

In the earliest days of the D&D game, some dragons could take human form. It was a fascinating idea—a great and terrifying beast in the skin of a mere mortal. Fortunately for many players, it was initially an ability that good dragons had. Later, that ability migrated to neutral and evil dragons, such as the oriental dragons of the first *Fiend Folio* or the deep dragon in Ed Greenwood's *Drow of the Underdark*. The *Council of Wyrms* setting made it possible to play dragons in the D&D game.

Draconic humanoids also showed up in various forms, as did humanoids that could become dragons. Todd Lockwood's krolli appeared very early, in *The Dragon* (#36, April 1980). Draconians came only a little later, appearing in the *Dragons of Autumn Twilight* novel and *Dragons of Despair* adventure. Dragonkin appeared in the FORGOTTEN REALMS setting, and the defilers of the DARK SUN setting could become dragons over time. *Monstrous Compendium Annual Volume Three* presented the weredragon, which became the song dragon in Third Edition's *Monsters of Faerûn*. Even the DRAGON DICE game had dice that represented dragon kin.

Third Edition pushed the draconic humanoid further, starting with a new look and feel for kobolds, as well as half-dragons. As the edition evolved, draconic creatures and spawn of Tiamat also appeared, along with the dragonblood subtype. One race that fell into that subtype was the dragonborn of Bahamut, humanoids who, to show devotion to Bahamut, willingly took on draconic traits in place of their original biology.

The dragonborn of the 4th Edition D&D game take many cues from the dragonborn of Bahamut, as well as other dragonblood creatures from 3rd Edition. Like their predecessors, the dragonborn bear a mystique and fierceness unique to dragons, and they can be strongly affiliated with draconic deities. In fact, in an earlier iteration of 4th Edition, the dragonborn were called the dragonblood.

In the final analysis, though, the dragonborn name was a better fit. It more aptly describes a race of draconic humanoids that share the legacy of the most important creature in the DUNGEONS & DRAGONS game.

Crafters among the dragonborn take care and time with their work. A finished work is an expression of the nature and capabilities of its maker. Although completed items are seldom as ornate as the work of dwarves, a dragonborn item almost always has a distinctive flare. Elemental, draconic, and scale motifs are most common, as are bold colors and precious metals.

The love of bold colors and precious metals extends to jewelry, gems, armaments, and even coins. Many dragonborn crafters are jewelers, gemcutters, smiths, or minters. Clearly an expression of the draconic tendency to hoard valuables, dragonborn adorn themselves with baubles of all sorts, and dragonborn warriors and adventurers seek out the finest gear. Most dragonborn show reserve and taste in this aspect of personal adornment, rather than garish overindulgence.

LEISURE

Improving abilities and competition take precedence in dragonborn leisure activities. When dragonborn aren't honing their skills, they're playing a game or engaging in an activity to prove their grit—mental, physical, or spiritual. Dragonborn don't restrict their activities to familiar skills. Part of developing oneself is expanding one's horizons.

Dragonborn do prefer competitive games. Although team events are fine, contests that have one clear winner are favored. Therefore, a dragonborn hones skill at strategic board games, philosophic riddle contests, improvised storytelling events, and one-on-one sports.

The ferocity of the draconic spirit couples with physical strength and militaristic culture, leading dragonborn to create and participate in sports more violent than many other peoples are used to. In fact, numerous dragonborn—even nonheroic sorts—form fighting or wrestling clubs, as well as regular contests of weapon skill. Intrepid dragonborn try their hands

at actual blood sports, such as gladiatorial matches, pit fighting, and dueling.

ENEMIES AND ALLIES

Dragonborn have few overarching racial enemies or allies. Their history might have provided them with a natural enmity for tieflings, but that doesn't pan out in reality. The same can't be said for devils. It is the nature of dragonborn to form strong ties with trusted friends, however, and a dragonborn's boon companions are often treated more like family or clanmates.

Despite the centuries-gone war between Arkhosia and Bael Turath, few modern dragonborn hate tieflings. Most see the disintegration of the two nations as a mutually shameful episode in history, brought on as much by the eroding of Arkhosia's creed as the depravity of Bael Turath's rulers. Many dragonborn also recognize that those tieflings now alive aren't responsible for the wrongdoing of their forebears. So dragonborn weigh tieflings like they do other people—on individual merit, respecting even the worthy adversary.

Exceptions to this generality exist. Some dragonborn clans, especially those who have descended into barbarism or those who still serve dragons, still bear old grudges. More widespread among dragonborn, however, is ill will toward the true masters of Bael Turath, the devils who led the once-human empire astray. Few dragonborn are willing to put trust in anything or anyone that even seems to be aligned with the Nine Hells.

Dragonborn do rely on allies and friends. In fact, dragonborn are frequently without nearby family or clan members, and comrades are essential in the darkening world. Dragonborn give their all to support those who trust them. When such associates show a similar sense of duty, dragonborn come to see them like relatives. They eventually form clanlike

bonds with them, sharing the stories of their lives and people. Nondragonborn do well to realize the honor they're being given when such bonding occurs.

ENCOUNTERS

Dragonborn employ intense and straightforward tactics, aiming at taking enemies out of an ongoing clash. Their military leaders facilitate efficient butchery. Arcanists pour on damage, their attacks resembling dragon breath weapons.

The dragonborn presented here are intended to supplement those presented in the *Monster Manual*.

DRAGONBORN COMMANDANT TACTICS

The dragonborn commandant leads from the front, wading into adversaries along with the troops. He or she sizes up the opposition, quickly using *designating smite* to direct followers' attacks. When the chosen target becomes bloodied, the commandant gives a *termination order*. The commandant then uses *designating smite* again on the next turn to focus damage on another enemy. In between giving tactical directions, the dragonborn attacks using *arcing slice*, breathing *dragon breath* when more than one enemy can be caught in the blast.

DRAGONBORN ELEMENTALIST TACTICS

This dragonborn hangs back and opens the battle with *acid rain* on clustered opponents. He or she then uses *lightning blast*, supplementing with *dragon breath* when an opportunity presents itself. *Icicle spray* is the elemental's preferred attack against foes that seem likely to approach and make melee attacks, and the dragonborn often uses this power just after resorting to *winging wind*.

Dragonborn CommandantLevel 7 Elite Soldier (Leader)		
Medium natural humanoid		
XP 600		
Initiative +5 Senses Perception +4		
HP 158; Bloodied 79; see also <i>dragonborn frenzy</i>		
AC 24; Fortitude 22, Reflex 18, Will 21		
Saving Throws +2		
Speed 5		
Action Points 1		
⬇ Fullblade (standard; at-will) ♦ Weapon		
+13 vs. AC; 1d12 + 5 damage and marked until the end of the commandant's next turn.		
⬇ Arcing Slice (standard; at-will) ♦ Weapon		
The dragonborn commandant makes two fullblade attacks, each against a different target within reach.		
⬇ Designating Smite (standard; recharge ☒ ☐) ♦ Weapon		
+14 vs. AC; 1d12 + 9 damage, and the target is marked until the end of the commandant's next turn and slowed (save ends). In addition, while the creature is slowed due to this attack, the dragonborn commandant and all his allies gain a +1 power bonus to attack rolls and a +4 power bonus to damage rolls against that target.		
⬇ Termination Order (immediate reaction, when an adjacent enemy becomes bloodied; encounter) ♦ Weapon		
The dragonborn commandant immediately recharges <i>designating smite</i> (if necessary), and uses that power against the triggering enemy.		
⬅ Dragon Breath (minor; encounter) ♦ Acid		
Close blast 3; +12 vs. Reflex (+13 while bloodied); 1d6 + 5 acid damage.		
Dragonborn Frenzy (only while bloodied)		
A dragonborn gains a +1 racial bonus to attack rolls and a +2 bonus to damage rolls.

ENCOUNTER GROUP

The following is a sample central cadre in a dragonborn mercenary company. It represents the unit's commander and that commander's pet, the magical center of the unit, and the commander's trusted soldiers.

Level 7 Encounter (XP 1,550)

- ♦ 1 dragonborn commandant (level 7 elite soldier [leader])
- ♦ 2 dragonborn soldiers (level 5 soldier)
- ♦ 1 dragonborn elementalists (level 8 artillery)
- ♦ 1 rage drake (level 5 brute) ☼

About the Author

Chris Sims started out working for small d20 companies in 2003, then landed a freelance editor gig for Wizards RPG R&D. Wizards finally got annoyed enough by his constant applications to hire him as the *Duel Masters* editor in 2005. From there, Chris wheedled his way into RPG R&D as an editor, and finally became a story designer after masterminding a few choice assassinations. His credits include *Monster Manual V*, *Secrets of Sarlona*, *Rules Compendium*, and the *Eberron Survival Guide* (thanks, Logan!).

THE ECOLOGY OF THE

by Paul Leach • Illustrated by Howard Lyon

DRIDER

Even the drow have outcasts they can look down upon—the driders. Half dark elf, half giant spider, every drider is a twisted abomination and a mockery of the centaurs that roam the forests. Cursed by Lolth, the very goddess who once favored them, driders burn with shame and bloodlust to match the evil and depravity of their former lives. Although they have been driven from their communities, they often prowl the fringes of drow territory, longing to reclaim their rightful positions. They are feared, but they are also hunted.

Every drider is said to have once been among Lolth's Chosen, powerful spellcasters with the ability to lead her dark children to victory against their many enemies. Many Chosen remain unknown, but drow assume that the greatest priests, warlords, and heroes rank among them. The goddess promotes strength by overcoming opposition, and so puts her Chosen through a secret, diabolical test. The exact nature of the test may vary from one candidate to the next, but no one ever speaks of it—pass or fail.

Those who please the goddess continue in their ruthless acquisition of power, glorifying Lolth, while those found wanting are transformed into bloodthirsty monstrosities. Although it is heresy to speak it, some believe Lolth creates driders capriciously.

ECOLOGICAL NOTES

Driders are made, not born. Few beings have witnessed their infernal transformation, not that many drow spellcasters merit the double-edged attention of their goddess and risk such consequences for failure. The change may take hours or days. A cursed drow typically enters seclusion or leaves her home when it begins, for if she is trapped in a drow city in drider form, she will be slain by her erstwhile fellows.

Once the new drider recovers from the physical trauma of metamorphosis, it is filled with a craving for warm-blooded prey. Its arachnid hunger is guided by a malevolent soul and an intellect darkened by self-loathing and a hatred for all drow. In some ways, though, the drider tries to continue its previous life by acquiring more spellcasting power. Even if the monster does not advance further in its former class, it retains some of its

old abilities and can use them as well as any creature whose mind tinkers with madness. Spells are a great way to subdue prey and protect oneself from hated former kin.

Despite the Spider Queen's obvious dissatisfaction with her fallen Chosen, she still allows drider clerics access to her domains. Perhaps she wishes them to test her other servants, who will either become stronger or perish to the outcasts' poisoned fangs. This is no different from the internecine fighting she encourages already. The goddess even allows a drider to serve in her fiendish Hand of Vengeance (see "Revenge of the Spider Queen" in *DRAGON* #279).

Drider Lairs

Driders prefer seclusion, where they can indulge their bitterness and plan grand, mad schemes of vengeance against Lolth's faithful. They might maintain the same dens for decades, living like murderous hermits. They generally seek intelligent creatures only to consume them. Driders often haunt fungal forests and subterranean lakes, places that attract humanoids seeking food and water. They even linger near drow communities, preying on the irregular patrol,

merchant caravan, or goblinoid slave gang. Driders typically operate within a few miles of their lairs.

When selecting a lair, driders prefer caverns that are not dead ends and try to prevent enemies and prey from entering undetected. They don't like to be surprised, and they always prepare an escape route in case things go badly. This is often a winding vertical shaft, which limits pursuers' line of sight and is hard to climb. They favor terrain that helps them spot invisible intruders, such as mud patches, lakes and pools, and beds of mold. Driders often use shriekers, natural warning systems that do not necessarily arouse suspicion, and sometimes protect their lair with warding spells such as *alarm* (usually set to produce a mental tone) and *glyph of warding*.

As they did in their previous lives, driders amass treasure. Their hoards consist of whatever they took with them when they fled drow society, as well as

the possessions of their victims. Driders especially prize magic items that help them avoid detection. However, driders never search for powerful magic, such as *wish*, with the intent of transforming back into drow—they know that Lolth would only curse them again.

SOCIETY NOTES

Driders don't really have a culture of their own, nor do they form long-lasting communities. The only thing they have in common is their drow origin, a shared affliction, and a burning desire to avenge themselves on uncursed drow. Some of them turn to the worship of other gods, such as Ghaunadaur and Vhaeraun from the FORGOTTEN REALMS Campaign Setting, drow deities of oozes and ropers, and of thieves and male drow, respectively. Even these cults are scarcely unified, though, and they are still despised by normal dark elf worshippers.

If they share their existence with other creatures at all, driders prefer mindless beings—especially monstrous spiders, although they might have *charmed* servants. A drider cleric may have a gang of undead at its command, while a cleric of Ghaunadaur might protect its den with several slimy guards. Bugbears, troglodytes, and trolls can serve driders, but they usually have to be magically controlled since they fear the drow outcasts.

A drider might form temporary alliances to fight a common enemy or pursue greater spoils in blood and loot. Often a settlement of evil humanoids allows the drider to reside within its territory and harass neighboring enclaves of drow or other foes. Driders sometimes form joint ventures with bandit gangs, and they can be found assisting small groups of duergar and derro.

VS. PCs

Driders surprise and trap their prey, softening it up with ranged spells, then finishing it off in melee. They take care to protect themselves from ranged attacks, which make these tactics less effective.

Preparation

The drider's spellcasting style influences its approach to combat.

No Surprises: Driders know the value of stealth and do all they can to prevent enemies from using it against

them. A drider might keep *see invisibility* or *invisibility* *purge* on hand to deal with those pesky duergar raiders, as well as deep-delving adventurers with access to magical invisibility. Driders already have the advantage of innate *clairaudience/clairvoyance*, but wizards can add this to their spell lists as well.

Extra Protection: Drider wizards and sorcerers focus on defensive spells such as *blur*, *mage armor*, *mirror image*, *protection from arrows*, and *shield*. Clerics use *entropic shield* and *shield of faith*; those with undead minions bolster them with *desecrate*. *Silence* is the best protection from enemy spellcasters.

Time To Leave: A drider keeps a spell or two in reserve to expedite its retreat or delay pursuers. *Darkness*, *gaseous form*, *invisibility*, and *stinking cloud* are good choices.

Tactics

Once engaged, driders can pursue several different options.

Welcome to My Parlor: When they are not hunting, driders lure prey into their lairs. *Dancing lights* and *ghost sound* are good ways to attract curious passersby. Drider clerics sometimes use undead to carry stones imbued with *daylight* spells. From a distance, any of these methods produces the impression of unwary, light-dependent surface dwellers stumbling about, irresistible bait for most denizens of the Underdark.

Surprise! Driders prefer to get the drop on their opponents. Sometimes they need only hide in the upper reaches of a cave with a high ceiling, using their darkvision and climbing ability to spy on victims from above. A drider might let its servant creatures initiate combat, distracting foes while it moves up using *Hide* and *Move Silently*.

Good spell selection never hurts, and drider wizards use their inherent *levitate*, or sometimes *invisibility* paired with *fly*. *Rope trick* is a great way to watch the next meal from seclusion, then drop a spidersilk rope when the PCs aren't looking up. Clerics can use *meld into stone* and *obscuring mist*, while those with the Trickery domain have even more sneaky choices.

Stand-Off Attacks: Driders try to incapacitate their foes as quickly as possible from a distance. Some clerics pave

SAMPLE TREASURE

A drider has double standard treasure. A typical hoard has a total value of 2,600 gp. The drider might not have any magic items, but usually it has three or four minor items or a couple of minor items and a medium item. Assigning treasure randomly favors potions, rings, and scrolls, but a DM could choose to give the creature anything within range that it might find useful. The following useful magic items provide a sampling of treasure that suits a drider's abilities and general personality traits.

Potions: cure light wounds, cure moderate wounds, nondetection.

Minor Wondrous Items: *elixir of hiding*, *elixir of sneaking*.

Minor Rings: *counterspells*, *feather falling*, *protection +1*, *sustenance*.

Medium Rings: *invisibility*, *protection +2*, *wizardry (I)*.

Scrolls: Any of the spells mentioned in the discussion of drider tactics.

the way for magical and poisonous assaults by using *doom* on enemy spellcasters, but otherwise they use direct spells such as *hold person*, *sound burst*, and *spiritual weapon*.

Driders wizards and sorcerers cast dramatic, flashy spells to flatten the PCs. They usually begin with *web* and *ray of enfeeblement* to trap and weaken the most dangerous opponents. After that they might use *spectral hand* to deliver *chill touch*, *ghoul touch*, *shocking grasp*, or *vampiric touch* spells. *Magic missile* is always a good choice, and multiple castings can blast away the hit points of PC spellcasters and keep them off-balance. *Fireball* has its uses, but it is most often a last-ditch tactic since a drider doesn't want to ruin the tasty, warm-blooded meal.

Regardless of spellcasting bent, a drider can simply shoot opponents with a bow. If it has ambushed drow patrols recently, it probably has arrows coated with drow poison. This tactic is tricky if the drider is *levitating*, however, which incurs cumulative negative combat modifiers.

Come And Get It: While the drider peppers the PCs with spells, its arachnid pets move in, as might any undead guards. (Clerics of Ghaunadaur prevent their oozes from destroying prey if they can.) The drider enters melee as soon as the PCs appear weakened. If the enemy is immobile (or won't leave) but still strong, the drider might dart into combat for a round or two to deliver a poisonous bite, especially if it can make a flanking attack. A drider cleric might use this opportunity to cast *bestow curse*, a great way to reduce a PC's chance of saving against its poison, or reduce his Strength to the point that one bite might render him helpless.

VS. DRIDERS

Don't think of driders as just another drow spellcaster who happens to be part spider. Add arachnid abilities (poison and climbing), decent Hit Dice and Constitution, multiple weapon attacks, and spell resistance to its magic talents, and you have a monster that can demolish a party quickly if it surprises them.

Preparation

Don't go blindly into a drider's lair or places where driders might lurk.

KILLER COMBOS

Driders combine very well with other subterranean denizens whose abilities complement their own strengths.

Driders Cleric and Shadows: A drider cleric can easily rebuke or control shadows, then use them in its ambushes. A good tactic is to cast *desecrate* on a section of underground passage and position the shadows there to catch the party unawares. Once a few PCs have lost some Strength, the drider moves in with its poisonous bite: The additional Strength damage will likely knock a character out of the fight. The drider rebukes the shadows if they threaten to kill most of the party—it doesn't want to miss the chance to taste warm blood.

A drider and four shadows make an EL 9 encounter.

Driders Wizard and Roper: The drider has one level of wizard, making it a 7th-level caster. It casts *stoneskin* on the roper to decrease the chance of cutting the strands. If it feels generous, the drider might cast other spells on its ally to defend against magic attacks, but it is more likely to protect itself (the roper's spell resistance is much higher than the drider's). The drider's poisonous bite is a devastating follow-up to the massive Strength damage from the roper's strand attacks.

This pair makes a tough EL 12 encounter.

Detective Work: If you have a chance to learn about a drider you might encounter, do so. Gather Information can provide some clues if you question enemies of the monster. If you can determine its spellcasting class, you can anticipate its magical tactics and potential allies. A wizard or sorcerer probably has plenty of offensive spells, but might not have companions other than a few monstrous spiders, if any. A cleric is likely to command undead creatures, but if you know its patron deity is Ghaunadaur, expect some oozes as well.

Protection Against Poison and Spells: The poison of driders and spiders deals Strength damage. Get ready for those nasty bites with antitoxin and spells such as *delay poison* and *neutralize poison*. If you don't have either of these, *bull's strength* is a good substitute. Even a simple *protection from evil* spell increases saves against the drider's poison (but not that of the neutral spiders)

and magic attacks.

Characters who have taken feats that increase saving throws, or who have racial bonuses on saves, also have an advantage.

Good Offense: Driders enjoy spell resistance and good saving throws, so it helps to have one or more of the Spell Penetration, Spell Focus, and Heighten Spell feats (listed in suggested order of preference). Spells that inhibit the drider's own casting, such as *silence* or *hold monster*, are good choices. Since the drider can put itself out of easy reach by climbing or levitating, be sure to use *spider climb*, *levitate*, or *fly* to improve your mobility and stay within reach.

Tactics

Consider hiring a ranger with aberrations as a favored enemy if the party doesn't already have one. And since driders usually don't enter melee until the party is badly weakened, make sure you have plenty of ranged firepower.

Detection: Don't let the drider and its gang of arachnids, undead, or oozes get the drop on your party. Use Survival to discover if any of those nasty monsters live nearby, and Spot to find those hiding in that giant mushroom patch or mold-encrusted cave. Divination spells can help a lot, especially *detect evil*, *detect magic*, *detect undead*, and *see invisibility*.

Stop the Spells: Keep that arrogant drider from wearing you down at range with spells. Responding with your own offensive magic, using one-shot, one-kill spells such as *hold monster* or *fireball* can work—if you can get past the creature's spell resistance, and it fails its saving throws. You need a fallback plan, such as counterspelling if you have a good idea of the drider's spell selection. A more reliable method is to use *silence*, which significantly reduces its choice of spells. You could try to cast the spell directly on the drider, but spell resistance and good saving throws are still a problem. Instead, give a *silenced* stone to a tough fighter who is going to charge the monster, or to a rogue who can skirt around it and set up flanking and sneak attacks. (If the stone carrier needs to engage the drider aerially, make

sure to cast *fly* first!)
Engage: Unless you successfully use magical and nonmagical ranged attacks to pummel a drider that cannot return fire and cannot escape, you will need to mix it up in melee. If you have neutralized its spellcasting with *silence*, you might be able to finish it off with only a couple of combat specialists armed with great Fortitude saves and big weapons. Otherwise, all bets are off—a fighter who laughs at poison can be taken out easily by a spell that requires a Will save.

PC DRIDERS

Driders are not easy to develop as player characters, considering their solitary nature and feeding habits. A drider might join a party of adventurers to achieve a mutual objective, such as raiding a drow outpost or dealing with a troublesome mind flayer. Perhaps the drider enlists their aid in retrieving magical possessions left behind in its former homeland. It is possible to expand this limited association, but such a campaign should remain in the Underdark. Hated as driders are in that sunless world, imagine how one would be received at the local tavern, even in the most cosmopolitan surface cities. Even a drider with a neutral or good alignment (a stretch in itself) is disturbing to most folk, with its bizarre, arachnid appearance.

This doesn't mean you can't work out a plausible background for a drider character and fit it into your campaign. One that is neutral or chaotic neutral is most believable, perhaps feeding only on evil humanoids. Such a character could even be a weird vigilante, a few steps below even the maligned half-orc paladin who is mistrusted by those he protects. If the DM allows it, a drider dedicated to Eilistraee (from the *FORGOTTEN REALMS Campaign Setting*) might even aspire to throw off its curse through the divine intervention of the Dark Maiden, perhaps by completing a great quest.

NPC DRIDERS

Driders make good opponents, but they don't get along well with most of the other creatures the PCs are likely to

encounter in the Underdark. A drider is typically the main villain in a small adventure or a side encounter in a large dungeon crawl. It sees the PCs as a meal foremost, but it might bargain if both sides are closely matched and the drider thinks it can use the party as pawns in its schemes.

An established drider could provide a different, stronger challenge to your PCs. One with additional cleric levels might have a small horde of undead servants and spider guardians. Such a powerful enemy doesn't send all of its minions into one encounter but stations them throughout its extensive lair. It might enslave a band of kobolds or goblins as a larder of live food, or work out some kind of arrangement with wererats, duergar, or derro to lure prey into its clutches. This kind of foe rarely parleys when faced with defeat but flees or fights to the death.

It is rare to find a drider in the service of another foe. It usually acts only as some kind of guardian or buffer against the outside world. Driders are dangerous to keep around, so only tough monsters, such as beholders or mind flayers, can keep them under control. Even so, if the PCs prove that they cannot be easily eaten, the drider might simply let them pass to fight its master, hoping to weaken all sides for its ultimate gain.

As a random encounter, driders often attack from ambush or track their prey over great distances to strike at an opportune moment. A hunting drider usually stalks alone to maximize surprise, but an ambusher might have some spider allies. Neither is looking to slay everyone it encounters; it would be satisfied with one or two kills.

ADVANCED DRIDERS

When adding character levels to a drider, remember that its favored class is drider, despite its former affinity for cleric (female) or wizard (male). Thus it faces some tough XP penalties when adding more than one class. This may not mean too much when creating an interesting foe, but it can be a problem for players who adopt a drider character. Even if it plans to advance in another class, a drider who casts as a cleric or wizard often takes one level of the associated class to gain access to 4th-level spells. *Air walk*, *giant vermin*, *lesser planar ally*, *poison*, *spell immunity*, and *summon monster IV* are good

choices for clerics, while *dimension door*, *greater invisibility*, *polymorph*, and *stoneskin* are some of the best spells for a wizard. Since sorcerous driders have to attain two more levels to get these spells, they are more likely to concentrate on a new class.

Spellcaster Classes: Drider wizards and sorcerers may find it advantageous to take a few levels in cleric, and the reverse is also true. A drider that can choose from all of the spells and tactics listed above is a tougher opponent, but not overwhelming. Clerical driders who take wizard levels are penalized by smaller Hit Dice (d4), but an arcane drider who takes cleric levels continues to add d8s. Clerics taking sorcerer or wizard levels get useful arcane spells, while the arcane casters that take cleric levels gain undead minions and support spells, but additional levels produce diminishing returns. High-level multiclass drider spellcasters might consider the mystic theurge prestige class. Spellcasters should focus on the Concentration and Spellcraft skills; Brew Potion and Silent Spell are useful feats, while Spell Focus and Spell Penetration (as well as their greater forms) are vital for fighting drow.

Rogue: Taking levels in rogue is a popular choice since its class features and skills enhance a drider's existing talent for stealth. It's easy to sneak attack an opponent who is beating off monstrous spiders or is trapped by a *web* spell. Dodge and Mobility are good feats for drider rogues.

Martial Classes: Driders make mean fighters, with increased base attack bonuses and Hit Dice, and quick access to feats. The ranger class complements driders' hatred of drow, allowing them to specialize in hunting that prey. Since driders already have Two-Weapon Fighting, they gain more benefit from this class by choosing archery combat styles. Ranger levels also let a drider maximize its stealthy skills while getting the fighter's base attack progression. Dodge and Mobility are also good choices for fighters and rangers. **D**

FLESH FOR LOLTH

THE SECRET LIFE OF DARK ELVES

by Robin D. Laws • illustrated by Marc Sasso

*O Flesh Carver, who wove the world;
Who made us from the darkest clay,
Spinning in it a red web of vein and artery,
We feel thy hunger.
O Lolth, humbly today we feed thee.
We feed you this flesh, this quivering meat.
With a blade like your jaws,
We divide muscle from bone.
Eat of this, the meal we consecrate to thee,
And do not this day devour us.*

—adjuration from the *Crimson
Liturgy of Lolth*

Through ancient stone corridors, wet and slick with moss, the drow gentry proceed. Screams and whimpers emanate from the amphitheater ahead. The cries prompt throaty laughter from a lithe, pitch-skinned priestess, her glistening body covered with dozens of gray-furred spiders that crawl across it, each the size of a baby's fist. The priestess's hair, white as an ice field, lays close to her narrow, oblong skull. Studs of polished silver protrude from her brow, cheekbone, and jawline.

Her gnome servant teeters from side to side, bent from the weight of the gilded chest she bears, laden with greenwine and sweetmeats. The servant's hands have been removed at the wrist; her eye sockets are scorched and empty. She cannot stop herself from shuddering.

Abruptly, a red-lipped jester capers up from behind, displaying steel hooks that jut

up through his shoulder blades. He seeks a new victim, someone to run his chains of precious metal through. The priestess reaches out to rake the clown with razor-honed nails, casually opening troughs of crimson in the flesh of his back. The jester shimmies and wriggles his tongue out along his rouge-caked lips.

A hiss of anticipation arises in the crowd. Tonight the blood will flow like wine, and if they are lucky, the spider goddess herself will appear and tear off someone's head.

Evil Beneath Your Feet

Many good people of the surface world fear the drow, even though few have ever beheld one. They've heard legends of the night-skinned elves and of their cruel and hungry goddess, Lolth the Spider Queen. Some say that these tales, which attribute every imaginable depravity to the dark elves, cannot possibly be true. Although there is evil in the world, the idealists say, the accounts of adventurers who come back from the Underdark must be exaggerated. No society, not even a completely evil one, could possibly continue if its people were as perverse and unpredictably brutal as their enemies claim.

So much for the prattling of sages! Go to any tavern frequented by explorers and treasure seekers, and they will educate you: If anything, the stories fail to capture the true horror of the dark elven world.

FOR YOUR CAMPAIGN

If your campaign doesn't include drow, or if drow don't play a prevalent role in your campaign, you can still use many elements of this article. Below are some suggestions to help spark your imagination.

- All elves are evil. There is only one subrace of elves (those described in this article), and they dwell on the surface instead of underground.

- Every few generations or so, a dark elf child is born into an elven community. These anomalies are seen as portents and usually signal a change in a major power structure or in the environment and ecosystem. These dark-skinned children possess strange powers and abilities (see the drow description in the *Monster Manual*), and they are gifted (or plagued depending on one's opinion) with visions of the future. Although they are given a special role in their community and treated with a high level of respect, they are often shunned in their childhood by other youngsters and forced to become self-sufficient.

- The drow are outsiders from another realm. Having exhausted their own world of humanoids to enslave and sacrifice to their hungry god, they've begun invading other realms in search of prey.

- As the result of a major environmental catastrophe, a new race (the drow) has been born on the planet's surface, perfectly suited to the planet's post-apocalyptic, hostile environment in which only the strongest and most clever survive. Never having known peace, this new race has no concept of good and is multiplying at an alarming rate.

- There are no dark elves. Instead, there is a cult of evil surface elves who refer to themselves as "drow" and worship a spider god named Lolth. They believe that by sacrificing thousands of humanoids, Lolth will bless the dying elven race, and they'll once again reign supreme over the other races.

FOR YOUR CHARACTER

Don't play a drow? Don't worry! There are still a number of ways you can use the information presented in this article. For example, you can use it to create an interesting background and plot hook for your character. Below are some ideas that you can use as is, or you might use them as a springboard for creating other interesting backgrounds for your character.

- **You killed my father; prepare to die.** The drow murdered your entire family, leaving you orphaned as a child. Maybe you were captured and tortured by drow, but you managed to escape their clutches. You've studied their ways and learned their weaknesses, and now you are ready to fulfill your promise of revenge. You won't rest until the world is rid of this abominable race.

- **Luke, I am your father.** You've always looked a little different from the other elves. Your skin is a bit darker than normal, your hair a little more blonde, and your eyesight is a little sharper in the darkness. Your mother, who raised you alone, is soon to leave the world of the living, and she is ready to tell you her terrible secret: Your father is a drow! Torn, you must decide whether to seek out your father and learn this new aspect of your heritage or keep your mother's secret exactly that—a secret.

- **Oh brother, wherefore art thou?** Your sibling has been kidnapped by the drow for sacrifice, and it is up to you to rescue him before he becomes food for their hungry goddess. Having received training in reconnaissance, your plan is to infiltrate drow territory as a merchant and then glean as much information on the enemy as possible before leading a rescue attempt. Although your mission is dangerous, you have no choice—you are your sibling's last hope.

"We Are All Lolth's Meat"

Drow society survives as it does because a powerful and capricious goddess wills it so. Lolth—known as the Mother of Mandibles, the Flesh Carver, and the Weaver of Webs—rules drow existence. Through her terrible earthly agents, the priestesses, she takes an interest in each individual, from painful birth to wretched death. From early childhood, all drow know that they exist only to provide their goddess with food and pleasure. Those who survive to adulthood learn not to fear this eternal truth, but to embrace it. They face any hazard with steely resolve, knowing that no danger can be remotely as terrifying as the face of Lolth. To worship her is to blot out doubt and hesitation. Her dark and beady eyes contain the only truth: Life is but a fleeting dance between predator and prey. Eventually, everyone is torn apart and digested. Therefore, the only way to grant meaning to existence is to ensure that you make many kills before you die and that you show your taste and style by making your prey suffer exquisitely as they expire. A drow who cannot find delight in agony and destruction is no drow at all, fit only for ritual slaughter. When courage wavers, the true drow need only chant to herself the central credo of her faith: "We are all Lolth's meat."

Although all drow embrace death, each individual naturally prefers to embrace the death of others over her own. The desire to avoid becoming Lolth's next meal drives all interactions in a dark elven community. Even the mightiest priestesses must watch their backs to ensure that ambitious young acolytes don't schedule them for the Flesh Carver's feeding chamber. For every hundred adults in a drow community, its priestesses must make one sacrifice per week. The priestesses satisfy the grinding demand for new sacrifices in various ways. Vigorously they seek blasphemers and lawbreakers to consign to their blood altar. They solicit informants, who report the infractions of others to avoid becoming victims themselves.

Only on rare and glorious occasions can a drow community justify the sacrifice of one of its own adults. Its victims are most often slaves or captives. Still, shortages of captives can occur at any moment, and smart drow always make sure they have at least one patroness among the local priesthood. Each priestess surrounds herself with a network of toadies who do her bidding. Normally, no priestess dares sacrifice the favorites of a higher-ranking colleague. Although a wheedling and servile manner never harms one's chances of success with a priestess, a proud and dignified drow can prove herself indispensable in other ways.

Renowned artists, skilled torturers, knowledgeable sages, and accomplished craftsmen can ensure their survival by serving both the priestesses and the community at large. Among all their favorites, the priestesses covet hunters the most. These hunters are drow adventurers who rove the passageways of the Underdark in search of intelligent captives to enslave or sacrifice.

Lolth's priestesses know what she best likes to eat: Drow are better to sacrifice than other races, adults are better than children. She prefers healthy individuals to the sick or feeble, and the more powerful and skilled a character, the better. Among non-drow, the Spider Queen vastly favors humanoids over all other creature types and would rather devour the good and lawful than the evil or chaotic. Unintelligent beings (with an Intelligence less than 3) are beneath her interest, for they cannot understand their suffering. To place a mere animal on her altar is to risk being eaten yourself.

The priestesses determine if their sacrifices lack sufficient quantity and quality to please their goddess. When they must know for certain, a *commune* spell provides the Great Spider's direct answer. Usually, though, experienced priestesses can, by reading omens, tell if Lolth is content with their gifts. One telltale sign of the goddess's displeasure is the success of one's enemies. If, for example, a party of adventurers penetrates the drow community's defenses, it is clear that the Spider Queen has withdrawn her favor. To win it back, the priestesses must increase their regimen of sacrifices—starting with the invaders.

Bloodied From the Birth-Sac

A notable difference between drow and their topside cousins lies in their fertility rate. Most elves have very low fertility rates, in keeping with their long lifespans. Drow mothers, in contrast, give birth as often as the more fertile races, such as humans and orcs. Their greater fertility reflects the crushing mortality rate among drow infants and youngsters. Drow females might give birth to ten times the number of babies than the females from other elven subraces do, but this does not mean that they end up with more adult children.

It is common for pregnant drow to carry twins or even triplets. Even in these cases, multiple births are rare, as the strongest of the fetuses feeds on its siblings in the womb. Pregnant drow can sometimes feel these mortal combats take place in their bellies. Such prenatal battles produce in their mothers a euphoric sensation, referred to in the Undercommon tongue as *chad-zak*. The feeling is infinitely stronger than that produced in

the bedchamber or by any intoxicant. Without it, it is doubtful that drow women, selfish to the core, would ever deign to suffer the inconveniences of reproduction.

Chad-zak occurs up to four times per multiple pregnancy. It usually happens early in the third trimester. Mothers who experience repeated chad-zaks usually feel them in quick succession, once every one or two days. The final chad-zak indicates one fetus's successful slaying of its rivals. This process does not result in

PRIESTESS WAR

A terrible logic arises from Lolth's taste in sacrifices. If she prefers drow over non-drow, and high-level characters over lowly ones, it stands to reason that her favorite victims are her own top priestesses. Thus, the priestesses have devised a way to avoid winding up on their own altars: They band together. Most of the time, a community's priestesses maintain an attitude of respectful, but mistrustful, distance from one another. If one priestess moves against another, the rest tend to side against the aggressor. The annals of drow history recount several famous incidents in which rebellious priestesses lined up allies against a High Priestess only to be betrayed by their supposed allies. A priestess must be extremely unpopular before her fellows will stand idly by for her sacrifice.

Open conflict within a priesthood is not unknown, however. In almost all such cases, a schism erupts between two sides that are evenly matched with one another. These fights are prone to expand into outright civil wars that engulf entire communities. Each faction of priestesses uses its favored lackeys, soldiers, and hunters to war against the other. Dark elven historians have even documented cases in which warring priestesses recruited outside adventurers from the surface to bolster their forces.

Lolth never intervenes in such struggles, even when it means the demise of entire communities. The success of the predator should never be restrained by sympathy for the prey.

stillbirths; the slain are absorbed back into the mother's body.

Playing For Keeps

The fact that a newborn drow has survived in the womb and made it through birth does not guarantee its further survival. All drow children, even those not yet able to walk, feel an instinctive homicidal impulse toward their siblings. In fact, when opportunity rears its head, most drow youngsters happily kill any playmates. Despite this fact—or, rather, because of it—children are not kept apart in drow nurseries. Their mothers want the strong children to sharpen their predatory inclinations, polishing off their weaker offspring in the process. No drow wants a weak or incompetent child to reach adulthood, where she might bring shame to the family. Note that strength need not be physical; it is better to have a spindly child whose cleverness allows her to engineer the deaths of others than a well-muscled brute who is easily fooled. It goes without saying that any drow bent toward mercy or virtue stands out as glaringly weak. In the unlikely event that his siblings don't gang up on him and crush his windpipe, the mother will surely send such a shameful freak of nature to the priestesses, as fodder for their ceremonial daggers. It is for this reason that good drow are exceedingly rare. To survive without enthusiastically embracing evil is next to impossible.

Drow parents rarely visit their children. Some weak-minded males might enjoy playing with their spawn, but nurses and other servants keep a watchful eye on them.

No doubt because it is such a dangerous time for them, drow children grow up much faster than the children of other elves. By the age of eight, drow children can walk, talk, and speak. They are then carted off to receive schooling. Junior priestesses tutor the young, savagely punishing them for misbehavior. Students might be caged, doused with scalding or freezing water, poked with sharpened sticks, poisoned, burned, or simply pulverized with fists and clubs. Such ill treatments scarcely seem to slow down these untamable children, who have already proven themselves bullies and survivors at home. Priestesses never fatally harm their charges; if they want them dead, it's wasteful not to sacrifice them.

Religious doctrine is the main object of study. Youngsters are also drilled in combat maneuvers, literacy, mathematics, alchemy, natural history, and various artisan skills. Students who demonstrate an affinity for magic are often taken out of classes and apprenticed to wizards and sorcerers.

School continues until the age of twenty, when adolescence officially begins. By this time, one out of every three students will have been murdered by classmates. Another one in ten will have been sent to the temple as food for Lolth.

THE ETHICS OF DROW KILLING

Adventurers who want to maintain their good alignments must always think before they smite. Just because the vast majority of orcs or bugbears, for example, tend to be evil, does not guarantee that any particular orc or bugbear deserves to be mercilessly cut down in the name of truth and virtue.

With drow, such qualms do not apply. Virtually any individual in a drow community has already proven him- or herself a murderer—even small children.

Be warned, though: By the same token, almost all drow, including very young ones, are experienced killers and might boast shockingly high levels as warriors, rogues, or sorcerers. More than one adventurer has died an ignominious death after relaxing his guard with a drow child.

Drow wanderers might, in exceedingly rare circumstances, claim the mantle of goodness. Some individuals exile themselves from their murderous communities in search of a peaceful life out of Lolth's reach. In most cases, they'll be consumed with shame and self-loathing, unable to fully shake the savagery of their formative years. A supposedly good drow might not gut you in the night as you sleep, but he'll still constantly wrestle with powerful impulses toward dishonesty, selfishness, and treachery. The fact that surface-dwellers shun them at all costs makes life even more difficult for the infinitesimally tiny fraction of drow who sincerely seek redemption.

Tests of Treachery

During the years that bridge childhood and adulthood, young drow are expected to choose a role for themselves in society and to set themselves on a path toward achieving it. They typically latch on to mentors, learning their skills and acquainting themselves with their contacts. Once a young adult drow gains enough experience, she waits for something terrible to befall her mentor (or she might engineer it herself if required by one of Lolth's tests) and attempts to step into her mentor's place. Typically this attempt requires conflict with rival apprentices or others with a claim on the mentor's clients, position, and property. It is considered a high crime for drow to mentor their own children, although dispensation from high priestesses can sometimes be had, for a price.

Masters are given the rights of life or death over their protégés, but then, so is everyone else. Adolescents may not ingratiate themselves with priestesses, and are therefore without protection in drow society. They must keep their heads down, while at the same time proving themselves useful to their patrons. To tip the balance either way is risky. A too-humble apprentice is perceived as easy to bully, while overly ambitious ones alarm their masters, who begin to fear assassination.

At the approximate age of eighty, adolescents are expected to complete a task indicating their mastery of their chosen role. A hunter must capture a valuable sacrifice, while a musician must perform a particularly difficult ballad. Not only must the drow perform her task well, she must not show any self-doubt or fear. Doing so means failure in the eyes of Lolth, and it results in horrible punishments. Success indicates that the drow is ready to be recognized as an adult. Adolescents who pass the test without dispatching their mentors must set up shop for themselves, going into business independently.

Murder Ballads

As adults, drow look for protégés to exploit, rivals to destroy, and opportunities for pleasure. Wealth and luxury are seen as outward signals of success, but the true measure of an adult's status lies in the number of people she's murdered (or caused to be murdered),

and the creative manner in which her prey were made to suffer as they slowly perished. Just as a slow, torture-filled slaying wins more admiration than a mercifully quick sneak attack, different victims accrue varying amounts of prestige. Killing a victim well known to the community confers more glory than a mere outsider. Credit for sacrificial victims goes to those who capture them. Thus, the hunter class is among the most admired in drow society, second only to the priestesses.

An ingenious evisceration means nothing if others do not know of it. Hence, bards have a crucial role among the drow. Social climbers hire bards to commemorate their slayings in song. If possible, they even invite the balladeers to attend the killings, to more vividly portray the slaughter. A skilled bard with a popular following can greatly enhance a drow's prestige, transforming a run-of-the-mill execution into a celebrated slaughter. Bards patrol the winding passageways of an underground community, yipping out their gore-spattered ballads in the screechy, affected tone expected of a drow singer. The hiring of a famed bard can cost tens of thousands of gold pieces, and the more an individual drow pays, the greater her chances of social elevation. The subject of the song might, for example, attract a more powerful priestess as a patron or gain new, well-heeled customers for her business.

Especially popular murder songs outlast not only the fame of their victims, but of the killers. Along with newly commissioned songs, bards perform timeless classics such as "The Burning of Farza-Lach," "Tornon's Guts," and "Seven Drips from the Gore Cord."

Accompanying a drow bard's keening voice is a complex, lute-like instrument known as vazhan-do. Their tight strings can be plucked furiously, unleashing a violent torrent of notes, or slowly bent, producing slow and disturbing sounds. Any of the sixty-four strings of the standard vazhan-do can be quickly unstrung from the instrument, doubling as a garrote. It is not surprising that bards often double as assassins, as their nightly rounds allow them to travel throughout the community without question. Although their status as hired killers is well-known, it would be unthinkable to restrict their movements.

To refuse to give a bard hospitality is to seem both cowardly and unsporting. However, it is one thing to invite a bard into one's home and quite another to let him out of one's sight for even a moment.

The Tests

Lolth does not make it easy for her minions to please her. All drow feel a sense of creeping unease as they progress in their careers. This is true no matter what roles they've selected in life. All fear the day when they reach a level of achievement that catches the cruel attention of their grim goddess. Even the all-powerful priestesses are not immune to the dreaded Lolthtanchwi—the "Punishments of Lolth." Lolth puts her worshipers through a number of terrifying tests throughout their lives, the first of which occurs in late adolescence (1st level in game terms). The tests continue as the drow progresses in strength and skill, each one more demanding and with more terrifying consequences than the last (for more on the tests and punishments of Lolth, see "Punishments of Lolth" in this issue).

Drow perceive when each test is about to descend on them. Their senses become painfully acute, and the world seems both more crisply real and more menacing. In some cases, horrifying visions preclude the start of a test, while in others, a sign, such as the sighting of a particular spider, indicates a new test. Different tasks are required of the drow for each test, and they invariably require the drow to risk both her life and all she has achieved in life to date.

Love Wounds

As is true for many species of spiders, drow mating rituals are unpredictable and fraught with peril—for the male.

Women enjoy an unquestioned upper hand in drow society. The priestesses run all political affairs, and grim-faced matriarchs control families and their business proceedings. According to drow stereotypes, females are smart, cool-headed, and cruel, while males are foolish, impulsive, and emotionally weak. Males kill and maim to defend themselves and to prove they are not cowards. Females kill and maim because they enjoy it.

Females marry for political reasons but are not monogamous. They may

dally with their followers, with travelers from other communities, or even with servants and slaves. Husbands are expected to remain faithful to their wives and are usually sacrificed if caught cheating. On the other hand, if a powerful priestess takes a liking to another woman's husband, she can have him consigned to the sacrificial altar for having the temerity to refuse her his favors. Charming, well-muscled males often face such no-win situations. For this reason, handsome men often disfigure themselves or spend long periods away from the community in all-male hunter bands.

Drow custom allows its females to engage in cross-species coupling; if a male engages in such a dalliance, it is considered a capital offense. Any sexual contact between a drow and a drider means instant death, no matter what the status of the drow. Congress with driders remains the mightiest taboo in drow culture.

In the Drip, Drip, Dripping Dark

As fearsome as they are, the drow are beset by many powerful enemies. They must defend their subterranean communities against mind flayers, dwarven warriors, and other humanoid adventuring parties. Drow settlements cannot be cleared out by merely charging from room to room and killing the inhabitants of each chamber. Dark elves react quickly to intrusion. They install sophisticated magical alarms and mount systematic patrols throughout a wide perimeter so that the entire community is mobilized for battle by the time enemies can reach its gates. The drow wear down opponents with waves of conscripted soldiers and common soldiers before sending out high-level hunters and mighty priestesses.

It is possible, though difficult, to gain peaceful admittance to a drow enclave. As lovers of luxury, dark elves hunger for unusual foods, strange intoxicants, fine fabrics, beautiful jewels, and other exotic items they cannot produce themselves. They're also always in the market for slaves; specimens too damaged to work can at least be torture victims.

Drow pay for these items with captured loot from raids or with unique magic items produced by their talented wizards. They ensure premium value for these items by keeping the techniques of

their creation secret. Most decent individuals abhor all signs of drow craftsmanship and look askance at those who make open use of drow magic items. Although many sellers of magical curios refuse to handle these items, they fetch high prices in lands that have a tendency for evil.

There are easier ways of making a living than running trade caravans into the Underdark, but a few intrepid individuals have earned fortunes this way. Drow do not easily trust outsiders, even when vouched for by traders they already know. Only after many successful and mutually profitable trade missions are non-drow given free access to a dark elven settlement. Even an ally of long standing can always be hauled off for ritual murder when he commits a major gaffe, or if the drow are desperate enough for sacrifices.

Drow are most likely to admit adventuring parties past their gates as the bound, gagged, and unconscious captives of hunting parties. Most captives are maimed and put to work as slaves, but adventurers are usually treated with extreme care until an auspicious time for sacrifice arrives. Still, it is not unknown for adventurers to escape from captivity and fight their way out of a drow enclave.

Spiders, Spiders, Everywhere

The chambers of any drow settlement crawl with spiders. From mites the size of pinpricks to guardian tarantulas the size of houses, there is no area of a dark elven community devoid of spiders. They skitter in swarms across walls and along floors. They drop from ceilings. Webs, some stronger than rope, hang from every imaginable surface.

Although guests might be unnerved by the spiders' inescapable presence, the locals pay them no heed. Cobwebs are waved or burnt away without comment. The squishing and crunching sound of stepped-on spiders is a constant refrain. Drow do not bother to check for spiders before sitting. A matriarch might idly seize a fist-sized spider while negotiating a trade arrangement and proceed to casually rip its legs off, one by one. Drow breads and puddings are speckled with stray legs, mandibles, and eggs. The overwhelming presence of so many spiders is often disconcerting to non-drow

visitors, but draw themselves hardly take note of the creatures.

Theater of Atrocity

There are no more fervent followers of the arts than dark elves—provided that the works in question revel in demented evil.

Lolth's ritual slayings can be seen as a gruesome form of performance art. Although everyday sacrifices are conducted in small temples or shrines, events featuring notable victims are often held in large amphitheatres in which the entire community can gather. These events provoke a carnival atmosphere, with raucous laughter filling the hall as jesters leap through the stalls. Bards stroll the aisles, singing of murder, and celebrants haul in food and wine to consume throughout the event. Intoxicating vapors waft from censers, making hearts beat faster and hands tremble with bloodlust. Priestesses and other members of the gentry watch from private boxes fixed with blinds that can be drawn for privacy. Everything from conspiracies to trysts might be negotiated in the confines of these boxes.

Most drow bloodsports are horribly brutal and gory. In one popular entertainment, a bound captive is held beneath an apparatus that slowly drips a magical acid onto his forehead, one drop at a time. The solvent opens up a hole in the victim's skull and then melts the brain. During this time, orbs of telepathic power communicate the dying victim's memories to the salivating crowd. Attendees vicariously savor the captive's most traumatic and painful experiences as he slowly succumbs.

Not all bloodletting in the amphitheater is fatal. Torturers often display their supreme skill with their filleting blades by leaving victims just on the brink of death. The most artful torturers become as famous as bards. Even torture victims, left alive to magically heal between performances, can become drow celebrities if they can communicate their suffering artfully enough.

Drow taste in the decorative arts is appalling to non-evil humanoids. One particularly skilled class of drow artisans specializes in incredibly lifelike sculpture that looks as if it's created from living flesh. In truth, the

sculptures are carved from blocks of drider silk, elaborately hand-painted and made to move through complex mechanical craftsmanship. Many are life-sized depictions of torture or mayhem. Common motifs include a human paladin impaled on a pike, a spider eating the brains of a halfling, or the good elven god, Corellon Larethian, carved up on the torture table.

In some drow communities, more abstract pieces are popular, such as a tapestry of liquid flesh in which hundreds of oozing eyes continually drift upward and downward in a regular wave pattern.

Predation, Travel, and Warfare

For many male drow, finding peace and autonomy is possible only on the trail, away from their wives, mothers, and sisters. (Although nothing stops female drow from becoming hunters, women tend to stay at home, closer to the levers of power.) Hunters win status for themselves and wealth for their families by capturing slaves and sacrificial victims. They especially seek out adventurers to attack, because such powerful individuals are highly prized sacrificial commodities.

It is a short step for some discontented dark elves to keep wandering and never return home. So-called "good" drow are typically former hunters who have decided to find places for themselves in other societies. Even when fighting for apparently good causes, they find their ingrained predatory habits hard to shake.

Prosperous drow communities might decide to give Lolth her favorite gift of all and launch warfare against a nearby town, village, or underground settlement. The object of such conquests is always the same: mass murder. Victorious drow slaughter entire populations in the name of Lolth. On rare occasions, ambitious priestesses seek alliances with other drow enclaves, hoping to build armies big enough to overrun and slaughter entire nations. Such efforts might be successful in the interim but are generally short-lived, as it does not take much provocation for jealous priestesses from different communities to turn on one another.

Death and Burial

In the bloodthirsty culture of the drow, the words "burial" and "old age" do not exist. It is rare for a drow to survive past 400 years, and sooner or later, a drow powerful enough to have gained so many years will certainly attract the attention of Lolth and end up on the sacrificial altar. Drow who die of natural causes are considered to have shamed Lolth. Their bodies are simply left to rot, their carcasses feeding the insects and vermin. In some cases however, such as when a more prominent drow dies of natural causes, the priestesses might choose to use the death as an example to other drow, imparting on them the shame that comes with never having caught the eye of Lolth and been called to sacrifice. The corpse of such a drow is strung up over the door of her family home, suspended by delicate spider silk, and left until only bones remain. This serves as a symbol of the family's shame, and a reminder to other drow of the benefits of murdering particularly long-lived family members. Drow who fall in battle or who have been killed by another drow receive a "blessing" from Lolth. Rather than being thrown on the garbage heap or left to rot over the doorway of one's ancestral home, the flesh on their bodies is ceremoniously stripped from the bones by a priestess, dried, and used for clothing enhancements or to make czakls, special bowls used to collect blood drained from sacrificed victims. Their remaining body parts and bones are soaked in a strong acid, and after a few days, nothing remains.

The drow have no concept of ancestor worship, and they do not grieve for fallen family members. Instead, they are too busy scheming how to use the death to their advantage. This might mean gaining new power and prestige within the family, new business contacts, or new inherited wealth. On the extremely rare occasion that a drow feels loss over the death of a mate or family member, it is advantageous to hide such feelings. A dark elf stupid enough to demonstrate an emotion as useless as grief is considered an abomination, and quickly and painfully sacrificed to Lolth. ☐

The ecology of the dryad

Lesson of the day: Don't catch them, they'll catch you

by Shaun Wilson

Though it was mid-autumn, the air was warm on the day of the class picnic. The sun was bright, the sky clear of all but a few clouds, and a breeze gently stirred the grass and fallen leaves. Everyone agreed that the guest of honor had outdone herself with her weather-controlling spell, and Belzime, druidess of the Eastern Wood, received their praise with a satisfied smile.

Old Malec the Sage had suggested to his students that they bring large lunches when they went out to meet the druidess and her companions at the edge of the wood. In this way he assured there would be enough to share with Belzime and her three attendants, an aged elven woman named Hibiscus and two comely young women.

"Now, isn't this better than listening to my dull speeches in some sage's dingy classroom?" Belzime asked the assembled students. A chorus of cheers came in answer.

Only Malec dissented. "My classroom has its attractions," he said after finishing off his slice of roast boar.

"At least there we don't have to resort to 'repel insect' spells to keep the ants in their place."

"A useful spell, nonetheless," said Hibiscus. "As a sorceress and a woodland dweller, I can appreciate the value of having a druid around. Are any of your students interested in druidical magic?"

"I think the boys are more interested in your two followers," Malec observed as he regarded his charges from beneath shaggy white eyebrows. Most of the boys were clustered around one of the young women,

a flame-haired beauty named Robinia. "At any rate, now that lunch is over with, we should get on with the lecture. Are you ready, my dear?"

"I think so," said Belzime. "The topic I've selected for today concerns one of our lesser-known forest allies and friends, the wood nymph, also called the dryad."

A few of the boys giggled at this announcement. "Apparently," she continued, "some of you are already familiar with the topic. What do you know about dryads?"

their tree-souls into animate shapes. The dryad is a permanent physical form of an oak tree's soul, and is only found around huge and old oaks of at least fifty years age. The tree must be large enough to have a powerful soul, to support the dryad who will live with it and within it. In some sense you could call the dryad a parasite, but that is not a flattering term and isn't very accurate as well.

"Being an extension of the oak tree's soul, a dryad cannot live if her tree dies or if she

After a pause, one of the older students called out from the front of the class.

"Dryads look like women with green hair, and they live in trees. I think some of them can talk to plants and some can teleport themselves."

"Not bad," said Belzime. "That generally sums up what most people know of dryads, though some of what you say is not quite correct. Wood nymphs are quite beautiful, as you have probably also heard, and they do have green hair. As for the rest . . . well, I'll start at the beginning."

"Plants, like animals, humans, elves, and such, have a life force that is much like a soul. This force is much fainter in plants than in animals, but some of them still have fairly powerful auras. The most powerful plant auras are found in oak trees, and sensitive humans, particularly druids, can feel the power of their life force from three paces away. This is one reason why we druids consider the oak tree sacred."

"Certain oak trees in ages past were invested with a special gift, and could form

is taken too far from the tree itself. Most dryads will never stray more than a thousand feet from her tree in any direction. They call this area in which they live a *terel*.

"You may be surprised to know that dryads do not need to eat, though they can consume the same foods that you and I do. They like the taste of nuts and berries, and may dig up certain edible roots as spices or foods. In the wintertime, when most plants become dormant and grow more slowly, the oak tree's life force becomes weaker. Sometimes a dryad must then eat more foods in order to sustain herself, and many store away foods that they gather during the fall for this purpose. It is rare that anyone will see a dryad in winter; like the trees, they also "sleep" for long periods of time to conserve their energy.

"Because of her ties with the oak tree's soul, a dryad gains certain special abilities. She can communicate with all forms of plant life, and especially well with the ancient treants. Since most plants are passive and unintelligent, they will obey anyone they understand. A dryad can cause plants to reach out and entangle pursuers, act as spies to report if anyone has passed by, cause vines to trip people, and so on. So close is the link between dryads and plants that most of them name themselves after trees in their woods, yielding some lovely names indeed.

"As an extension of a tree's soul, a dryad can also merge with her parent tree at will. Many people believe that dryads have built homes inside their trees, and have such furnishings as tables, chairs, beds, and chests full of gold. Nothing could be more wrong; the tiny pile of coins and gems that fascinate the wood nymphs are usually hidden in a hollow of her tree or are buried among its roots. The dryad herself lives *within* the tree, merging fully with its soul and becoming intangible."

"If I may, Belzime," interrupted Hibiscus, "it should be said that the dryad can merge with other trees as well, though she will not remain long within them. If she feels threatened she can cause herself to become fully immaterial and she will be transported instantly to the oak that is her home, merging at once with the tree's soul."

"It is possible that some of you have heard of another power dryads have," Belzime continued. "Dryads like handsome young male humans and elves, and sometimes want to keep them — the same way they keep minor treasures. The dryad can cast a spell that enhances her beauty to a man, entralling him and enabling her to command the fellow by her thoughts alone. A number of my male druidic students have described this effect to me after being rescued from well-meaning dryads who were taken by their looks." Belzime smiled. "I must be a very familiar face to the dryads of this wood. I've led quite a few rescues."

A dark-haired boy sitting near the druidess spoke up. "Is it hard to get the boys back from the nymphs?"

"Well, it is at first. The young men never want to be rescued. Dryads are especially good at hiding their fellows, and the men are entranced so they will do anything to avoid being rescued. If the dryad wants, she can even cause her fellow to merge with her oak tree's soul by her magic; then it is very hard to bring him home. The dryad who has the lad isn't much help, and will deny having ever seen him. If I come and take the boy away, she will pout and look as if she'd lost a cherished toy. She likes to have the young man cater to her whims and bring her things, and he lives for nothing but the chance to stare blissfully at his 'true love.'

"Sometimes her spell over the young man will wear off, and the dryad will sigh and give the boy something to remember her by — a few coins, a gem or two, something like that. When the fellow reaches home, he usually discovers he's been away for several years."

"Druidess," called another boy. "How do dryads make more dryads?"

Belzime looked questioningly at Malec, who shrugged and said gruffly, "They're old enough to find out. Go ahead and tell them."

"Fine. Well, some of you may have heard about races of creatures that have but one sex. Dryads are one of them, as are sylphs, nymphs, and satyrs. Dryads can have children by human and elven fathers, and if they do then their children will always be dryad girls. Dryads can also have children by satyrs, which as you know are always male. The child of a dryad and a satyr is a dryad girl half the time, a satyr boy the other half. It hardly seems likely that dryads and satyrs descended from a common ancestor, so at best we chalk this all up to the perversity of magic, or the whim of the gods.

"The female child of a dryad," Belzime continued, "will stay with her for about twelve years. If the child is a satyr, the mother will turn the boy over to his father's band for his upbringing. A girl-child will spend the first few years of her life attached to her mother's tree. When the girl comes of age, she will be taken to an oak tree of her own and will become attached to it naturally. The child then becomes a part of that tree's soul, and will live there for the rest of her days. She will rarely see her mother after that, but she will be happy and content with her life."

"Why doesn't she see her mother after that?" a young girl called.

"Oak trees may grow reasonably close together, but dryads by their nature are solitary beings. They are happy by themselves, surrounded by their woods, and they only rarely wish other company. This part of their personality may have developed because oak trees large enough to support dryads are sometimes not easily found. Each dryad's attachment to her own oak tree restricts her travel, too, so each must be satisfied with where she lives — and so she is."

"Um, my pardons," said Belzime's red-haired attendant. Belzime motioned for her to continue. "It is possible for a dryad to leave the *terel* of her oak for a brief period of time, but she will never do so intentionally. To do so brings on *glirgimer*, the wasting away of her soul, and she will wither and die within hours. It is said that powerful magics can separate a dryad from her tree without harm, but" — the girl shivered — "that is a hard thing to imagine!"

One of the more athletic boys in the class, who had listened attentively through the lecture, raised a hand. "Is there some way to get hold of a dryad and not have her charm you?"

The color went out of the red-haired girl's face. "Why?" she asked hotly. "Do you want to catch one for a pet?"

"Robinia . . ." murmured Belzime. "Calm down. Perhaps the young man meant something else." From the tone of the druidess's voice, however, it was obvious that she agreed with her follower's

Many people believe that dryads have built homes inside their trees Nothing could be more wrong.

interpretation. She addressed the boy. "To answer your question, no. Unless one uses powerful magical defenses, the charming power of a dryad can overcome almost any man's resistance. And some dryads have kept their men hidden forever.

"If anyone were to try to lay violent hands upon a dryad, he would find her vanishing before him, on her way back in spirit form to her home tree, where she could alert any of her allies nearby. Mighty treants, remember, care about dryads greatly, and so do satyrs, elves, sprites, and pixies . . . and druids." The emphasis she put on the last word was lost on no one. "It is not a good idea to go hunting dryads for one's own sport," she concluded.

The youth chewed on a blade of grass and considered this. He seemed to lose interest in the remainder of the lecture.

Hibiscus broke the short silence that followed. "This brings up the question of what dryads like to do for fun — without having a fellow around," she said.

"Wood nymphs like their surroundings to be pretty, and themselves as well; they like beauty only for their own sake, not for what others care or think. Dryads will perfume themselves with crushed flower blossoms and style their hair with bits of flowers, leaves, and other woodland growths. Sometimes a dryad will find a way to trade some of her meager treasure for sewn garments, but dryads are just as happy without clothing as they are with it. That's another reason why young men often hunt for them — just to get a peek."

"They'll have to stand in line behind the satyrs," Robinia muttered in the background. Belzime gave her assistant a disapproving glance.

Old Malec stretched himself and stood up from the grass, dusting off his robes. "On that note, I think we should prepare ourselves for the walk home. We still have some things left to see in this forest." A chorus of groans answered him, but he was firm, and the class made ready to depart.

Because dryads are highly intelligent, they don't try to charm morons if they can help it.

"We appreciate your time, Madame Belzime," the sage told her after most of the students had set off for the next stop on their tour. "I think you did a nice job of convincing my boys not to comb your woods for nymphs."

"Don't worry," she said. "It's late enough in the year that they won't find them, or recognize them if they do. Remember what I said about dryads having green hair? That's only true in the spring and summer. It changes color in the fall to gold, red, or reddish brown. In wintertime it turns white."

Malec smiled. "So when the boys go looking for a green-haired girl, they'll only find girls like her." He pointed to Robinia, standing on the edge of the forest talking with Hibiscus.

"How long have you known?" Belzime asked.

"Since I heard her name. Am I correct in recalling that *Robinia pseudoacacia* is a variety of locust tree?"

Appendix

1. A dryad's *terel* cannot be distinguished from any of the terrain surrounding her oak tree; the dryad can roughly pace it out, however, because she becomes increasingly uneasy as she passes from the 33" distance to the 36" radius edge.

2. If a dryad is forcibly taken beyond 36" from her oak, she will rapidly (within five rounds) exhibit symptoms of starvation, depression, and exhaustion, and will die in 6-36 hours if nothing is done. A *heal* spell will negate all the symptoms, but the effect of the spell wears off in four hours, and *glirgimer* sets in again if the dryad is still outside her *terel*. An *exorcism* spell will separate the dryad from the tree's "soul"; in this event, the dryad must find another suitable oak tree within seven days, or the *glirgimer* symptoms begin. A dryad's magic resistance should be checked whenever these or other spells are cast upon her.

3. An average dryad lives for as long as her oak tree does. Damage suffered by the

tree will affect the dryad adversely, perhaps putting her into a temporary coma even if the tree survives the shock. If her tree dies, the dryad will die as well from *glirgimer* unless she is *exorcised* and transported to a new tree.

4. For spell effects, assume a dryad can use the following powers at will: *speak with plants*, *plant door*, *commune with nature*, *detect snares and pits*, *locate plants*, *locate animals*, *entangle*, and *trip* (at the 9th level of druidic ability), and *dimension door* (to anywhere within her *terel*). Some dryads (10%) have the power to use *pass plant* at will instead of the *dimension door* ability, though again it will only function within a dryad's own *terel*.

5. There is a 2% chance of encountering a dryad with a female child under twelve years of age. The child will have reduced statistics for an adult, as determined by the DM. For instance, a young dryad could have 1-4 HP, fight as a creature with less than 1 - 1 HD, and would have none of her

"adult" powers except the *speak with plants* ability, performed at 1 1st-level effectiveness. When the child reaches 12 years of age, her mother helps her find a suitable tree, and she takes up residence as a full-fledged dryad with 2 hit dice and all of a dryad's magical abilities. However, it takes time to master those abilities: the effectiveness of a young dryad's magic goes up one level every year (2nd level at age 13, 3rd level at age 14, etc.) until she attains 9th-level effectiveness at age 20.

6. For game purposes, a dryad's *charm* power works much like a powerful version of the druid spell *charm person or mammal*. An intended victim is allowed a saving throw (at -3, as per the Monster Manual) upon first encountering the *charm* power. (Magic resistance, if applicable, is checked before the saving throw.) A failure to save indicates that the *charm* has taken effect; then, on a roll of 1-3 on a d6, the *charm* is permanent. If the *charm* is not permanent, it will last for an indefinite period of time. The victim is allowed subsequent saving throws — each at -3 — at intervals that depend on the victim's intelligence. (See the chart on p. 55 of the Players Handbook.) However, because of the power of the dryad's *charm*, read the saving-throw chart intervals as years, months, and weeks instead of months, weeks, and days. For instance, a victim with 6 intelligence is allowed a new saving throw every two years; one with 18 intelligence can try to break the *charm* once every two weeks.

From this, it is easy to see why dryads prefer to enchant young (low- to mid-level) men who aren't overly intelligent — the sort who'll be easy to *charm* and easy to keep that way. Elves and half-elves, with their innate resistance to *charm* magic, are rarely the object of a dryad's "affections." She will try to *charm* a character with elven blood only if her life depends on it or if she runs across an elf or half-elf with 18 charisma. Because dryads are highly intelligent, they don't try to *charm* morons if they can help it; a servant of low intelligence would become boring before the influence of the *charm* wore off. But they can't resist trying to *charm* characters with high charisma, whether they're morons or geniuses. If threatened with harm or removal from her *terel*, a dryad will try to *charm* anyone she can.

A dryad can use her *charm* ability three times each day if necessary. She rarely has occasion to use them up since large groups of men don't often travel through her *terel*. Even when her *charm* powers are depleted, she can use her *plant door* and *dimension door* abilities to get home.

7. When a dryad is inside her tree, she can be hurt by any attack form that damages the tree (chopping or burning). But note again that a dryad has quite a few friends in the forest. Anyone who tries to harm her or her tree will have to get in line behind the satyrs, treants, wood elves, pixies, sprites, and druids — and deal with all of them first.

THE ECOLOGY OF DUERGAR

The ringing of hammer on anvil, choking blankets of forge smoke, repetitious chanting, and ceaseless toil—such bleakness embodies the world of the duergar. Living in the darkness, laboring to serve their god, the duergar find no joy in anything save the fierce satisfaction of a task thoroughly completed. With hearts as cold and hard as iron and souls as dark as coal, duergar desire merely to please their grim god and to slay all who oppose his will.

This article examines the life and habits of the xenophobic duergar, including their history, physiology, and outlook, as well as ways to defeat them. *Races of Stone* offers further information on the lives and ways of dwarves of all types

HISTORY OF DUERGAR

Duergar claim that their god, Laduguer, forged the world. In the time before time, the world was but a chill nothingness, containing neither life nor light. The desire for creation

existed, and the empty void of the universe pulsed with the uncontrolled desire to be. From that hunger formed the figure of a dwarf wielding a hammer, and with his hammer he shaped the void into a cold, dark world of eternal twilight. Laduguer beget Laduguer, it is said; he birthed himself out of sheer will and the desire to create.

Laduguer thus peopled the first world with his children, the duergar; the grey dwarves. He gave them the desire and skill to work, and provided them with materials with which to toil. He commanded them to serve him with production, to emulate their creator by creating new and wondrous things. The duergar call this the Time of Creation, where they worked in peace to forge magnificent items for their god, and all were content.

Even then, sometimes duergar creations floundered. Some attempted to make great things and failed, and thus Laduguer cast the unworthy into his forge as punishment. One such ambitious dwarf sought to set himself above

the rest, making himself superior to the others, although Laduguer made all equal. He worked in secret, struggling to master the power that only Laduguer commanded—the ability to create life. He forged strange creatures; ugly, spindly things that he flung from his workshop in disgust. The Lone Craftsman, as duergar call him, struggled day and night for a year, each time failing in his creation and throwing the mewling, misshapen monstrosities into the wilderness. All the creatures, races, and monsters of the world—animals, giants, elves, humans, kobolds, and orcs—arose from the Lone Craftsman's anvil. Thus, duergar created all other races.

After a year of failure, the Lone Craftsman finally succeeded. By his experience and will, he forged another dwarf. He made his creation taller, stronger, and more beautiful than the duergar, with skin of copper, hair of bronze, and gems for eyes. The Lone Craftsman was admiring his creation when Laduguer found the secret forge and flew into a terrible rage.

The Lone Craftsman fell to his knees, begging his god for mercy. He pleaded that he made his creation only as a tribute to Laduguer's greatness.

Laduguer roared, "Insolent fool! Do you think you can improve on my work by creating a life greater than your own? You do this for your own glory, not mine!" He struck the Lone Craftsman and turned him into a shrieking, gibbering madman without the skill, patience, or talent to create

anything ever again. Thus was born the first derro.

The damage already done, this began an age known as the Time of Perversion. The works of the Lone Craftsmen and their offspring spread over the world, forming societies and raising the best of their miserable races to the status of gods—gods who defiled the world with bright sunlight, green things, song, and other foolishness. The duergar despised these rejected

DUERGAR KNOWLEDGE

The following table shows the results of a Knowledge (local) check as it relates to the duergar. Inhabitants of the Underdark and adventurers that make forays into its depths might know this information.

Knowledge

(local)

DC Result

- | | |
|----|--|
| 10 | There are many subraces of dwarves. Some of these breeds lurk deep within the earth and toil for dark purposes. |
| 15 | Duergar despise all other races but reserve their most vicious hatred for other dwarves. They avoid the sun and bright light at all costs. |
| 20 | Duergar have the power to increase their size and become invisible. They create some of the most masterfully crafted goods in the world, although such items often lack ornamentation. |
| 25 | Duergar life revolves around the worship of their god Laduguer. They are particularly stealthy and resistant to paralysis, poisons, and illusions. |

creations, but none so fiercely as the dwarves descended of the Lone Craftsman's finest achievement: those bright-faced dwarves who live in the mountains and fancy themselves great craftsmen rivaling Laduguer's children. Duergar refuse to suffer these other dwarves' existences and hunt them relentlessly.

Now duergar live apart from the other races, in hidden strongholds beneath the earth where they work ceaselessly for the glory of their god. There they train as fighters, spies, and craftsmen to ensure the survival of their people. They trade by necessity, grudgingly offering the least of their wares (still among the finest crafts in the world) for food and materials other races provide. They disdain all things pleasant, bright, and beautiful as useless frippery, and refuse to sully their exquisite creations with such pointless accoutrements.

All duergar sneer at the fantastic lies the other races spin about their origins, because the grey dwarves know the truth. Each duergar exists merely to serve Laduguer, and they all dream of the day when their efforts are enough for Laduguer to vanquish the other races, blot out the sun, and bring about the Time of Perfection. Then duergar will return to the cool, dusky surface where they can forge in peace for all eternity.

PHYSIOLOGY OF DUERGAR

Averaging about 4-1/2 feet tall and more slender than most dwarves, duergar have dull grey skin that seems to blend with the shadows around them. With lean muscles as hard as iron, they move in near-silence with a fluidity strange to dwarves. Most duergar are completely bald, although some women develop lank rings of black, white, or gray hair and men often keep wiry beards. Overall, duergar bodies are studies in ultimate efficiency.

Duergar eyes are almost uniformly pitch-black and curiously flat, making a duergar's stare incredibly unnerving. Gray dwarves say that Laduguer bestowed incredible sight

on his children as a divine blessing so they might hunt their light-dwelling cousins more easily. Thus, duergar who invoke the wrath of their priests usually have their eyes put out as punishment, while the birth of a child with grey or white eyes is considered a terrible omen.

PSYCHOLOGY AND SOCIETY OF DUERGAR

Duergar society revolves around the worship of Laduguer, and gray dwarves draw no distinction between secular and religious authority. The priests rule as they always have and always will.

Laws are handed down and enforced by thuldors, the priests of Laduguer. Thuldors wear unpolished iron breastplates emblazoned with the broken crossbow bolt of Laduguer and holy brands of this symbol on their foreheads. Thuldors choose only the strongest duergar to join their ranks, but even then the initiation rites, which involve branding, torture, and performing feats of superhuman endurance, cull the weak and unworthy. The culmination of these trials involves tying an initiate between two crushing blocks of stone and leaving him in solitude for a week.

Gray dwarves forbid all other races access to their cities, as the presence of such abominations sullies their homes. In a few cases, duergar trade outposts allow other races to settle nearby, but only if they obey the priesthood. Duergar trade using heavily guarded caravans or other far-traveling emissaries. Drow make frequent use of duergar items, although they patronize the dwarves and act as if their goods were inferior to drow-crafted items. Duergar despise the dark elves for this reason, but they readily accept their coin.

Duergar spies, known as darkhafts, often travel among gray dwarf caravans. They gather information about the races they trade with and use that information to further duergar goals. As weapons traders, the duergar profit from conflict, and while the world never lacks in that, darkhafts

LADUGUER

Intermediate God (Lawful Evil)

The god of the duergar, Laduguer occasionally answers the prayers of other dwarves. The Gray Protector, as he is called, demands constant toil and a rigid adherence to order from his subjects, many of whom are stolid craftsmen, slavers, or would-be warlords.

Symbol: A broken crossbow bolt.

Portfolio: Magic weapon creation, artisans, magic, duergar.

Domains: Evil, Law, Magic, Protection.

Favored Weapon: Warhammer.

Clerical Training: Would-be clerics of Laduguer engage in hour after hour of repetitive prayer, punctuated only by hard physical labor or similar hardships. Those that endure the process become clerics and inflict similar mind-numbing initiations on the next generation of Laduguer's followers.

Quests: Laduguer's quests often involve awakening—and hopefully controlling—some long-buried evil. If an army of slaves is trying to unearth a fallen, ancient labyrinth-temple, Laduguer is probably behind it.

Prayers: Prayers to Laduguer are simple one- or two-sentence affairs, but they're repeated dozens of times, with exactly the same rhythm and intonation.

Temples: Laduguer has simple temples unadorned with decoration. Many have torture chambers, prison cells, or battle arenas attached to them.

Rites: Laduguer offers his followers few rites, because time spent in ceremonies is time spent away from proper duties.

Herald and Allies: Laduguer's herald, Garludor, is a particularly sinister duergar 10th-level rogue/10th-level assassin. When not on a quest for his god, the herald spends much of his time haunting the forges of Laduguer's faithful, assuring that work progresses and punishing negligent or unskilled craftsmen with his death attack. Laduguer's allies and those he most commonly sends to fulfill *planar ally* spells are bearded devils, barbed devils, and pit fiends.

sometimes give things a push. They enjoy encouraging the rivalry between two opposing factions, coaxing ill will to the surface like an erupting boil and then supplying both sides with weapons and armor. Not only do such underhanded acts open up new markets for their weapons, but they sow bloodshed among the countless races the gray dwarves despise.

Occasionally, duergar foster conflicts between small drow outposts or isolated tribes of other races, such as

derro or kuo-toa. Darkhafts exacerbate hostilities with well-placed words and false rumors until combat erupts and one faction destroys the other, at which point a unit of duergar soldiers attack, easily crushing the weakened "victors." Darkhafts carefully hide all evidence of duergar involvement after the dwarves' slaughter and looting, thus avoiding future trade complications.

DUERGAR LAIRS

Along with their grim cities, duergar toil and hoard their greatest works within the treasure-vaults of the thuldors. These unique strongholds are both massive workshops and bleak temples of Laduguer. They often have similar features but never have the same layout.

At least four duergar soldiers guard the entrance to a treasure-vault, as well as possibly one or two priests. Duergar require no light, so adventurers approaching carrying torches, lanterns, or magical illumination immediately give themselves away to the guards. Beyond the guards, a complex series of magical and mechanical locks and traps ward the stronghold's entrance.

The inner halls of thuldor strongholds usually lack living guardians, instead holding countless unique and ingenious traps and constructs. Wanderers through these halls should move cautiously and carefully, using long poles to test suspicious areas and ready *detect magic* and *dispel magic* in case of magical traps. Thuldors often create golems, particularly stone golems, and adventurers should consult with sages to learn ways to defeat these guardians.

The vault's center chambers hold the duergar's greatest treasures, countless masterfully crafted weapons, tools, and magic items piled upon mountains of rare ores, gems, and coins. Sometimes thuldors tame giant monstrous spiders or summon planar allies to serve as guardians for these vast troves. Thuldors who desire solitude—or those punished with it—sometimes reside here, relying on their magic to sustain them. Whether defending their work or trying to regain their brethren's

favor, priests encountered here guard the vault with their lives, and raiders should be appropriately wary.

VS. DUERGAR

Resolute and fanatical combatants, duergar fight not just to defend themselves and further their goals, but to destroy the abominations that are all other races. When facing such a combination of natural cunning and magical abilities, only the most prepared might hope to stand against a determined duergar.

Dealing with Invisibility and

Darkness: Lurking in the darkest depths of the Underdark and with the ability to turn invisible once per day, few ever see duergar coming. Those seeking out duergar or passing through their lands should ready several scrolls of *see invisibility* or *invisibility purge* to even the odds. Although such spells reveal invisible duergar, the darkness the gray dwarves favor still offers its own hindrance. Parties traveling through the Underdark with most forms of visible illumination (torches, lanterns, *light* spells, and the like) only attract more danger. However, since duergar and many other denizens of the Night Below are sensitive to exceptionally bright light, adventurers should rely upon *daylight* and scrolls or wands of that spell. Adventurers who wish to remain undetected and who don't all possess darkvision should equip themselves with *potions of darkvision* or similar magic. Yet even these magical measures won't help a group detect a stealthy duergar, as all duergar benefit from a +4 racial bonus on Move Silently checks. Thus, high Listen and Spot bonuses and spells that augment these skills (like *owl's wisdom*) should see frequent use.

Magic Both Natural and Divine:

With the power to enlarge themselves and a strict religious culture, magic almost always comes into play when facing duergar. Duergar warriors often use their *enlarge person* ability before charging into combat, while clerics make frequent use of *aid*, *bull's strength*, and *deeper darkness* to assist their allies and extinguish magical light. *Dispel*

magic, or at least *reduce person*, thus becomes necessary to even the odds. Conversely, grey dwarves are resistant to spells, particularly phantasms (like *nightmare* and *phantasmal killer*), and they are immune to all paralysis effects. Spellcasters planning on facing duergar should focus on spells that don't allow saving throws or that deal damage even on a successful save (such as *Melf's acid arrow* or *fireball*).

Poisoned Weapons: Duergar are immune to all forms of poison and make frequent use of it. Often, a volley of crossbow bolts coated in black adder venom, greenblood oil, or other Constitution-sapping injury poisons precedes duergar rushing into melee. Thus, adventurers should always carry antivenom and potions or scrolls of *delay poison*, *neutralize poison*, and *lesser restoration*.

Keep Out of Harm's Way: Duergar gain Strength bonuses from their *enlarge person* spell-like ability and often have bonus hit points from high Constitution scores. Those fighting duergar should stay out of reach and make full use of ranged weapons. Since gray dwarves have a speed of 20 feet, even when enlarged, using superior mobility and hit-and-run tactics easily wears down enemy duergar. If you can't avoid melee combat, attacks and spells that reduce Constitution or Strength scores (such as a rogue's crippling strike ability or the *ray of enfeeblement* spell) might help.

Beware of Spiders: Duergar frequently make use of the varied forms of monstrous spiders that roam the Underdark. Noted for making exceptional steeds and beasts of burden, these arachnid mounts allow the duergar to move much faster and even over vertical surfaces with ease. Given the duergar's penchant for stealth and poison, giant monstrous spiders or even phase spiders might serve the gray dwarves as deadly companions. Such a pair might easily sneak up on a party invisibly and ethereally before striking with surprise. ■

THE ECOLOGY OF THE DUNGEON

by Buck Deason Holmes

Artwork by David O. Miller

Make your underground adventures unique

Every developed PC and NPC has physical and emotional characteristics that make each of them interesting. Cities and villages have atmosphere and unique shops. A magical blade described as *Velinora's Gladius Bellum* is more valued than +1 sword. While people, towns, and even magical items are thought to have character, players do not generally think about dungeons as being "individuals." However, with a little extra detail, a dungeon can become very interesting and unique—not just because of the monsters, magicks, and traps found within it, but because of the dungeon itself; the way it looks and feels, the way it winds and flows. If one can create a dungeon with character, then one can make adventuring fun and new.

Bored with running the same old dungeon over and over, I thought about how I could make such a place fresh and enjoyable. After some contemplation and research, I came up with the following guidelines. While the basic principles listed below can be used for any setting (from forests to starships), I have focused on fantasy dungeon caverns. Cave-dungeons, I feel, are the settings that are usually the least interesting. If one can make a cave intriguing, one can easily make tombs and castles exciting.

The first thing to remember is that a dungeon is a miniature ecosystem. Life, geology, time, and weather affect and change it. All places populated by living creatures are animated and intricate, not just the places that happen to be above ground. A DM should make any adventuring area have this sort of feel about it. To help do that, one needs to think about the following topics.

How was it made?

Just as a player creates the childhood and ancestry of a character, the DM should figure out (basically) how a place was made and how it developed. What used to be there, and how did what is there now get there?

Caverns on our planet are created either

by erosion or magma flow. Erosion caves are old underground rivers and lakes; they wind and flow, with passages forking, turning and changing. Magma caves are tubelike, smoother than erosion caves, and straight; they generally do not split off in more than one direction. However, one need not make a cavern realistic; on another world, caverns could be created by other forces, such as giant monsters and uncontrolled magic.

In any event, interesting caves contain areas of different sizes and shapes. They are filled with small crawlways and huge rooms. These changes in dimension are very useful to a DM. How can a party flee or fight in an area only 3' in diameter? How can they navigate up and down all the passageways and cliffs while they are looking for treasure and monsters?

Think "treacherous terrain." One can create many encounters like the following: A group of five hobgoblins are on the other side of a 30' room and are shooting arrows at the PCs. No problem, right? Well, those hobgoblins could have 75% cover from the terrain while the PCs have no cover at all. Also, the floor of the room could be 20' below the ledge on which the party is standing. Now the PCs must either use up their magic and arrows on some lowly hobgoblins, or they must cross a very dangerous piece of terrain to get to the hobgoblins. The landscape makes this generally minor encounter into a major encounter.

Strange formations can add greatly to a dungeon. Many real caves have more than one opening to the outside. The party might have to travel in and out of the dungeon, fighting their way through a wooded area that separates two entrances. Instead of having a few forest encounters before going to a cave and having cave encounters thereafter, a half-in and half-out dungeon adventure could have both mixed together. This would make most of the PCs equally useful throughout the adventure.

Small holes that can develop between rooms can become natural murder holes

and arrow slits. These holes also could be a safe way to talk with creatures within the cave or spy on them. Natural columns, large stalagmites, crevices, and multiple entrances can fill a room with hiding places and areas to explore. A room with two large rocks in the center, with the path around them forming a figure-eight, would be an excellent place for a chase. (I can see the PCs running around and around looking for a thieving goblin who is hiding on top of a boulder.)

A cave also could be somewhat like a canyon, with parts of the top exposed to the surface. Now the party must decide if they should walk along the top and possibly miss some of the openings, travel the bottom and possibly be ambushed, or split up the group and explore both areas at the same time. Most players know how to have their characters maneuver through a smooth, cylindrical tunnel, so don't make it easy for them by making a dungeon with nothing but 10'-diameter tunnels and 30' rooms.

Combat is not the only activity that can be affected by terrain. Stalactites, stalagmites, flowstones, cave pearls, and other formations can be used to spice up many scenarios for many reasons. A certain rock formation might just happen to look kind of like a priest's holy symbol. Or the characters might be awed by the beauty of certain rooms. Giving a deserving description of such features would be a great task for a DM. If the DM could make the PCs imagine a room filled with gleaming columns and snowlike gypsum flowers, then the cave could become "alive" and memorable. An ingenious PC could make such an area into a temple or, if the character is more materialistic, a tourist attraction.

What is it made of?

As important as how the surrounding area was made is of what material(s) the surrounding area is made. One can quickly understand the importance of knowing what substances are present in a dungeon if one stumbles across a cavern with veins of gold and silver in it. But other substances also are important. Deposits of zinc (needed for brass), iron, coal, and tin would be very useful for the construction of weapons and trade goods. A wise dwarf may notice that all the kobolds' pots and tools are made out of copper, and she might go looking for their copper mine (not as exciting as a platinum mine, but still profitable).

The materials that make up a cavern may be important for other reasons. Limestone caverns would have a tendency to develop (maybe quite suddenly) sink holes. Areas with lead or mercury could be harmful to the creatures that live nearby; a resourceful PC might make friends of those creatures by helping to cure them of their poisoning. ("The spirits wish for you to move to a new location; then the curse on your people will be lifted.") Even more interesting and dangerous, a cave might

have uranium or other highly radioactive elements in it, which could cause native creatures to be deformed or changed in some way (attack of the giant mutant killer kobolds?).

This last example brings up another interesting point: A fantasy world does not have to follow the known laws of physics or chemistry. Certain substances found in a dungeon environment could enhance, alter, or nullify magic or psionics. Rocks could be highly magnetic, combustible, explosive, or influenced by other forces. Think up a new substance with strange and challenging properties: For instance, a cave could contain pockets of etherium, an element that becomes ethereal and solid again at random, causing natural secret and shifting doors. A prized metal in my campaign world is "float," a metal that repels gravitons (thus, it is nearly weightless); not only does this metal create weird natural phenomena, such as floating rocks, but also lessens the weight of weapons and armor, making it a prized material indeed.

What stories does it tell?

History, natural and documented, is a great tool for bringing life to a dungeon. While the PCs are exploring a cave, they could find bones, weapons, or equipment that tell a story about the cave. Fossils and ancient tools could indicate who lived in the cave long ago. The walls could be adorned with paintings or carvings from a race long dead. The PCs might make an anthropological discovery that causes sages to argue for decades.

Recorded history, told to the PCs by local villagers or even by the creatures within the cave, could set the tone for the dungeon. Many players like to have their characters look for maps or information about a place: let them look, and give them the information, but tailor it to suit the needs of the scenario or the campaign. The PCs might rush to a dungeon reported to be the location of the treasure of King Sloth but be less eager to enter a cave where Vstin the Great, the hero of Aldwic, was killed by some unknown evil. Such information doesn't have to be important to the plot, it only has to give character to the dungeon. And, of course, any information given to the PCs doesn't have to be true.

How stable is it?

Not every dangerous room has to be a trap that was specially created. Deadfalls, cave-ins, and weak pathways could be the results of natural processes. Unstable caves have caused injuries and drama in the real world; so can they in a fantasy world.

For example, a group of kobolds (each weighing no more than 80 pounds) might cross a natural bridge as they are fleeing from adventurers. This bridge will collapse if more than 200 pounds is put in one small area. The kobolds might not

even realize that the bridge will fall, but the human fighter in full plate armor will learn about it soon enough.

One need not have a floor fall out beneath the party to make the characters paranoid. The PCs could hear the sounds of another part of the cave collapsing and then begin anticipating a cave-in that will never happen. They might start to hurry, trying to make it out before the cavern collapses, and then panic when a few pebbles or some sand falls on them.

Physical changes to the cave also could result from the actions of the PCs. The use of powerful magic (*fireball*, *lightning bolt*, *rock to mud*, *dig*) could cause a local disaster. Pushing a boulder down on an attacking Lernaean hydra might seem like a good idea at the time, but when that boulder causes the floor to collapse, the PCs are going to wish they hadn't done that.

Another thing to remember is that a place changes if someone is around or not. The water level might drop, revealing more caverns. Caves might collapse or open up due to erosion or earthquakes. These changes can make a previously explored cavern into something entirely new. An adventure might center on hunting down a group of orcs that have moved into a previously explored cavern. The party confidently walks into the cave opening, sure in their maps and their knowledge. They know that the orcs would camp in the big room next to the well. They know about the shriekers in the third alcove. But as they move into the cave, they find that the passage to the big room has collapsed and a new passage has opened to the south. Even though the PCs have been through this dungeon before, they don't know what to expect now. Surprised, they might even become shaken and start to panic. The cave is physically different, so the party must stay on their toes.

How's the weather down there?

Weather affects everything, even underground environments. Rainfall and subsequent flooding may cause some caverns to fill with water. Imagine a group of heroes who go adventuring into a cave while a torrential downpour is starting outside. One passage (the only one that leads back outside) is steep, but the party can walk down it. However, when they return, this passage has become a stream, slick and treacherous. Now they have to crawl through the water to get out, and if they fall, they'll be washed back down 30 feet.

Cave temperatures do not change as dramatically as outside temperatures. Caverns isolated from the outside air will generally stay at a constant temperature, about 65° Fahrenheit. But even slight changes in the temperature can cause wind movement or fog. Rivers that are frozen outside the cave might prevent water from reaching a cavern. Areas in the cave but near the outside will be af-

fectured by temperature changes; water could freeze, causing areas to become slick or frozen over.

A flood or a heavy rainstorm can change an area quickly. If a cave entrance is positioned in just the right way, hurricane-level winds could boom down the caverns. Mud, avalanches, or timbers thrown by a tornado could cover an exit and trap characters. Animals that do not normally live in caves may seek shelter underground in harsh weather, causing problems for the PCs. And since the party is underground, they might not know about adverse weather conditions until it is too late.

What lives there?

Any lifeform that lives in an area must have access to the following necessities: water, food, air, and some measure of safety. Every elementary-school biology class teaches that, but many DMs forget it. My characters have entered many dungeons populated by enormous numbers of "living" monsters that had no way of getting the necessities of life. I have been guilty of such blunders myself: I remember one goblin cave that I located five miles from the nearest river (now I think of the poor goblins that had to carry water five miles every day to keep the settlement alive).

The first necessity is water. Make sure that a cave has wells, underground rivers, a lake, or some such source for the living creatures to get water from. If water is in short supply, certain smart creatures could control the source and then sell the water for protection or profit. Since most real caverns are made by water erosion, most of them do have water somewhere within.

Just as every lifeform needs water, every lifeform needs food. A "living" dungeon should contain or be located close to edible plant and animal life. Since fungi do not need sunlight, edible mushrooms are probably a staple of most underground humanoids. Smaller creatures, such as burrowing mammals, rats, bats, fish, and large insects, would supplement the diet of most beasts. Not only can these creatures add realism to your dungeon, but the noises and motions they make will keep the player characters antsy. If every part of a cavern is alive, then PCs will be cautious as they enter each room.

Life generally breeds life, so a fantasy cave might have as much life as a real rain forest. A cavern could be filled with different types of fungi, insects, and animals. These creatures might have developed defenses such as thorns, poisons, or bioluminescence. Another world could have millions of species of fungi that we do not have, especially a magical world. These fungi would be the food for other animals and would gain nourishment from the humus caused by other fungi and animals. Thus, a very complex life cycle could develop underground.

Airflow is another concern within a

cave. When orcs roast their victims, where does the smoke go? It will follow the wind and be dispersed throughout the cavern system. Particles of ash will blacken cave walls and leave deposits along the floor. This smoke might be so thick that anyone entering a "chimney" tunnel will not be able to see or breathe. An intelligent group of entities could design their fires so that the smoke will go into a trapped room.

Remember that (most) animals don't just come into existence when the party arrives. They live in the cave. They eat, build lairs, and carry on other life functions. Source books for many games, including the AD&D® game's MONSTROUS COMPENDIUM® appendices, give ecological data: try to use this information. Any facts about eating habits, activity cycles, reproduction, and gender interaction will help a DM. If a village of norkers has baby norkers in it, then it becomes a more believable place. These younglings also can create many strategic and moral dilemmas for the PCs.

Another aspect of life is refuse. Anyone who has been to a waste dump can see how trash can affect an area. Where do humanoids that live underground dump their waste? Well, they would probably have a special dump pit far downwind of their home caverns. They would throw everything down into the pit, including but not limited to biological waste, rotten

plants and fungi, dead animals, broken tools, and rusted weapons. Crafty humanoids might put a hidden trap door above the trash pit. Anyone walking on this trap would fall into the dump pit.

Not all the trash, however, would make it to the dump pit. Many humanoids are lazy and environmentally unconscious. Garbage of the most unpleasant kind may be found throughout the caverns of a dungeon. Piles of gunk and carcasses are in many rooms, a few covering secret chests of "treasure." When dealing with refuse, remember that any mention of trash makes experienced players think of rot grubs, otyughs, and other unpleasant monsters. In many adventures, I have casually stated that the player characters can see wormlike creatures moving through the filth. While these things were nothing more than normal worms, maggots, grubs, and carrion slugs (gross but not deadly), the PCs didn't know this. To my amusement, they went through all kinds of trouble to destroy these beasties and sort through the trash. ("If there are rot grubs, then there must be some kind of treasure.") Simple parasites can cause as much fear and worry in a group of PCs as a lair of trolls.

A DM also should think about how dungeon denizens interact. Why do the pixies live in room 14 and the hook horrors live in room 15? Do they share food,

Mithril Classics

A collection of thirty of the best selling Mithril Miniatures. Mithril have manufactured miniatures from JRR Tolkien's *The Hobbit* and *The Lord of the Rings* for over 8 years, and the range has expanded to over 300 pieces.

We have taken the most popular figures from this range and gathered them under the title of **Mithril Classics**.

For more details please contact your local Hobbystore.

Mithril Miniatures are manufactured in the Republic of Ireland and distributed under licence. If you require further information regarding stockists, mailorder or Mithril Handbook contact by letter, fax or phone: Mithril Miniatures, Macroom, Co Cork, Ireland. Tel: Int + 353 26 40222 Fax: Int + 353 26 40004

or play games together, or are they trying to rip out each other's throats? Would a small tribe of goblins live next door to a lair of ghastrs?

The best way to plan interactions between dungeon natives is to imagine what it would be like to live next to a monster. Before you design your next dungeon, think about the people you have lived with or neighbors you have had trouble with. Maybe they were misanthropes and wanted complete silence. Maybe they partied too loud for too long. Maybe you thought they were casing your place for robbery. Now imagine that those same neighbors or ex-roommates considered you a food source. If you thought that Mr. Rogers next door would eat your friends and take your gold, you might be a little reluctant to live near him. You would at least take precautions to make sure he wouldn't bother you.

As most people who have lived in a dormitory or a thin-walled apartment building know, a place develops "political" alliances. An ogre who is trying to catch some sleep after a long night of pillaging is not going to be very happy about a kobold midday festival; in fact, he is going to "ask" the kobolds to hold the noise down a bit, and he isn't going to be very polite. Perhaps such "political intrigue" could be useful to the party. Those kobolds, upset at being "evicted" from their residence, might show the PCs the best way into and around a cavern. They also might tell the party the strength and power of the ogre "landlord" and his friends.

These territorial battles need not be between intelligent races. Those same kobolds might have been pushed out by a big sabertooth cat or a cave bear. Animals have territory, too. Most creatures mark their territory in some fashion. Many apply their scent to the area, but others (especially intelligent creatures) will define their area with visible markers. Natural boundaries, such as pits and streams, also act as territory lines. Animals can sense these boundaries and respect them. If trolls like the taste of cave crickets, then the troll's lair will be devoid of crickets. Experienced parties might learn these signs and be able to identify territories, and thus be better prepared for upcoming encounters.

Finally, animals that have lived in caves will slowly adapt to survive in that sort of environment. Creatures in caves are generally smaller and lighter than their above-ground counterparts. While they may lose some sensitivity in their sight, they may develop better senses of smell and touch. Some underground versions of above-ground creatures may lose their pigmentation and become white or translucent. Some other creatures, however, might develop the "drow" adaptation: dark skin that acts as camouflage against creatures carrying light sources and allows the creatures to naturally hide in shadows.

Conclusion

The key to developing a cave or dungeon environment is interaction—between geology and life, between hunters and prey. A DM can create many interesting scenarios just by imagining how animals, plants, geology, and weather affect one another. For example, we decide that a cavern contains a vein of silver. It makes sense that someone would be mining the silver, so we add a few drow with their slaves. The drow would have spiders around as pets and guards. The spiders need to eat, so the cavern has insects in it. The insects also need something to eat, so we could put in some giant mushrooms. Now we have a cave full of interactions, a place with possibilities for intriguing adventures.

Not only will this type of creative work help make a dungeon seem real, but it also could help create more adventures. Imagine that the party destroys all the kobolds in a dungeon. Well, it so happens that these kobolds ate the bats that live in the cave. Now that the kobolds are dead, the bats quickly grow in population. Their number becomes so great that some of the bats are forced to leave the cave and move elsewhere. Also, these bats feed on the little skinks that live around the cave; in a short time there are so many bats that all the skinks are devoured. The skinks ate the itoya, a tiny fly whose bite carries a nasty virus lethal to humans. Now, because of the destruction of the kobolds, the nearby town of Shellow is plagued by bats and itoya flies. Imagine the shock the PCs will get when the priests of Shellow, after receiving a message from their deity, tell the characters that they must "restock" the cave with kobolds so that the bats and bugs will not plague the town.

Of course, one needs to be careful not to overdo it. Use the scenery to develop the setting. When writing a story, a good author must create an in-depth and interesting setting. So too, must the good DM. Each does this the same way: by adding details. One should try to make many of the details important: things that someone in the party will find interesting. However, a few mood-setting descriptions—detail just for the sake of detail, to add realism—are good to use and will help players put themselves into character.

Books, conversations with professionals, and even TV are great sources for further ideas. You can't go wrong with an issue of *National Geographic* or an hour of the Discovery channel. TSR's DMGR1 *Campaign Sourcebook* and *Catacomb Guide* talks about water, air, and loadstone; it also gives tips on creating atmosphere and pacing. Of course, the best way to understand a type of scenery is to visit it. Travel to Mammoth Caves or Carlsbad Caverns if you have the chance (both are really impressive). If you are feeling adventurous, go spelunking. Experiencing a real adventure will help you create hundreds of imaginative imaginary ones.

The Ecology of the ELEMENTAL WEIRD

At home in raging flames, surfaceless seas, unyielding granite, or limitless voids, the elemental weirds often make their way to the myriad worlds of the Material Plane. These harbingers of the fickle fates promise to reveal furtive secrets of the unforeseeable to the mortal races, although often at a hefty price. Indeed, these creatures of pure elemental form possess alien minds and needs well beyond the understanding of those who seek them out.

HISTORY OF THE ELEMENTAL WEIRD

The oldest of legends from the most ancient of races speak of prophecies, decreed fates, and soothsayers. This suggests the presence of creatures like oracular weirds at least parallels the mortal races of the Material Plane—and possibly predates the plane itself.

In many myths, elemental weirds are said to possess immortal heritages, often tracking their lineages back to specific deities and the primordial elements of the world. Some such tales speak of deities lying with the unspoiled rivers and teaming oceans, giving birth to nixies, sirines, many of the mortal aquatic races, and the eldest water weirds. Inspired by their divine legacies, whispered to by the rolling waves, and

confided to by all the creatures of the sea, it is said that whatever water touched, these weirds knew.

Similarly, myths of volcano spirits that bestowed truth and the gift of fire to the early races describe the role fire weirds played in the legendary past. Said to be the corporeal messengers of deities, fiends, or possibly some indefinable intellect of the Inner Planes, these living flames brought much needed hope and warmth to the dark days of prehistory—revealing insights and laws all sentient creatures were meant to know.

Much like water weirds, legends tell of earth weirds springing from divinely inspired mountains, canyons, and lightless depths. Described as treacherous harbingers of suffering, the rotting dead supposedly whisper their secrets to earth weirds, who thus foretell times of waste and death. Despite their morbid words, earth weirds are said to know the will of the world, serving as emissaries of some greater planetary consciousness. Their dark words and fearful, underground demesnes are at least partially responsible for the widespread distrust of emissaries of the earth, particularly the fey.

Air weirds figure only subtly in legend. Rituals of praying to an open sky—a heaven above—partially arise from the ancient practice of seeking guidance from these spirits of the air.

The offering of incense, ash, and flowers to the winds suggests a long history of seeking direct guidance from those elementals who call the sky home.

PHYSIOLOGY OF THE ELEMENTAL WEIRD

The corporeal form of all weirds share many characteristics. Each appears as a striking female figure comprised of a single element, whether air, earth, fire, or water. These homogenous forms behave in a manner similar to true elementals, being resilient to weapons and the vulnerabilities of an organic body. They also prove highly resistant to spells, shrugging off most with little worry.

As elemental weirds are made up only of the elemental essence of their kind, organs, flesh, nerves, and blood are alien to their composition. The very energies that flow through these creatures, however, far surpass those of many other creatures from the Elemental Planes, granting immense intelligence, spell-like powers—particularly related to powers of divination—as well as other strange abilities.

Seemingly as a limit to these powers, though, all weirds are bound to an elemental pool to which they remain permanently tied. Of diverse shapes

and sizes, at their smallest these pools fill an area 20 feet across and 40 feet deep, but whole lakes, volcanoes, or larger tracts of land or sky might comprise them. These pools are more than merely pure accumulations of natural elements, though. Each is in fact a small projection from an Elemental Plane, which contains a portal to that

hostile realm. An elemental weird holds great control over its pool, possessing the power to summon creatures through it for aid, as well as the ability to allow others to enter the pool and pass onto its home plane. The draw of the Inner Planes is powerful, though, and a weird's control is not absolute. Thus, many have accidentally entered the pool of an

KNOWLEDGE OF THE ELEMENTAL WEIRD

The following table shows the result of a Knowledge (the planes) check as it relates to elemental weirds. Those who study the Inner Planes, worship the powers of the elements, or are knowledgeable of prophecies or similar mysteries might possess this information. The elemental weird appears on page 90 of *Monster Manual II*.

Knowledge (the planes)

DC Result

- | | |
|----|--|
| 10 | An elemental weird is like an elemental, but is often less prone to destruction. |
| 15 | Elemental weirds typically appear as beautiful humanoid women. Each is tied to a specific element that determines its form and powers, but also binds it to a pool of concentrated elemental matter from which it can never leave. |
| 20 | Elemental weirds possess immense magical powers, potent oracular abilities, and guard portals to the Inner Planes. These elemental augurs command great influence over other elemental beings and can even wrest control of such creatures from their summoners. |
| 25 | Elemental weirds typically demand rare offerings or services for their insights. These oracles are sometimes guarded by elemental servants known as guardian weirds. |
| 30 | Air weirds specialize in information relating to guidance. Earth weirds warn of impending doom. Fire weirds weave prophecies of peace and prosperity. Water weirds hold knowledge of antidotes and healing. |

elemental weird and met swift deaths, either from the inherent dangers of the flowing and grinding elements or upon the unforgiving Inner Planes. Just as frequently as mortals seek to employ an elemental weird's gift of foresight, they often request use of a weird's portal to the Elemental Planes. Weirids are quick to bargain for their pool's use, but are just as likely to wantonly refuse—supposedly out of some prophetic elemental insight.

Being spirits of the Inner Planes, weirids must maintain their link to their homes and cannot be separated from their pools—never straying more than 10 feet. Once, however, an elemental weird can make use of its pool's portal to travel back to its elemental home. Upon passing through, the portal closes and the weird's pool is drawn back to its native plane, leaving no evidence of the oracle's passing. Weirids usually only leave the Material Plane when they face assured destruction, risk having their site forcibly used by the unworthy, or when their prophecies so demand. It is conceivable that unbound elemental weirids might be found on the Elemental Planes, but none have ever been seen. Some propose that, upon retreating to their native planes, elemental weirids merge with the plane, imparting their vast intellect and observations back to the realm that spawned them.

PSYCHOLOGY AND SOCIETY OF THE ELEMENTAL WEIRD

While aloof toward the mortal races of the Material Plane, elemental weirids possess a certain fondness for creatures tied to their source element. Most often, this relationship resembles that between a

guardian and a servant or a demigod and a worshiper. Since a weird cannot travel away from its pool, these attendants serve vital roles as scouts, messengers, and the eyes and ears of the weird.

In regards to their own kind, weirids often live solitary lives; although on rare occasions as many as four might collect in places of particular power, importance, or elemental convergence. Interracial hostility is unknown to weirids, and groupings involve weirids of multiple kinds as often as weirids of the same kind.

Often the existence of multiple weirids in close proximity spawns numerous legends and local traditions relating to seeking mystical guidance.

The four most common weirids display a wide range of unique traits and affectations. These tendencies often hint at the type of information likely to provide.

Air Weirids: These weirids speak of facts and places, yet they speak of such in a manner more direct than most. For these elementals, the world exists as a compass with many choices, with each choice a possibility and each containing its own dangers and rewards. Unable to predict the actual future of a chosen direction, they supply information regarding the facts of the journey. These flighty creatures offer neutral indecisiveness to most mortals, seeing all paths as equal but leading to vastly different journeys.

In trade for their insight, air weirids often request artifacts from far-flung nations, lost environments, or even other

planes. A rock from a mountain that long ago eroded to sand or a gear from Tvashti's Laboratory on the Outlands would not be unusual offerings.

Earth Weirids: Possessed of a cold, calculating mindset terrifying to most mortals, and capable of foretelling the death of thousands or the arrival of great wealth with equal dispassion, these weirids speak of future events the same as those in the past. Viewing the passage of time with the same indifference as mountains, earth weirids often speak of general fates, understanding that mortal minds lack the ability to comprehend exact details on an immutable future.

Emblems of finality and the bounty of the land most appeal to earth weirids. The skull of a thousand-year-old lich, crushed to powder, or a stone that has never been exposed to any sort of light might both appeal to one of these elementals.

Shrine of the Blistering Sibyl

Pool of lava surrounded by six female statues of metal and stone.

Lava flows cascade over exposed rock.

Smaller lava pools, each watched over by a female statue.

Crumbling stairs ascend to higher tiers.

Blackened bones and charred remains litter this lowest level.

Fire Weirds: Fire weirds represent the most empathetic of the weirds. Foretelling dreams of hope, love, and nourishment, these weirds provide the light in the dark to those who seek them out. Offering hope, however, falls short of actual investment in the well-being of those who seek their council. Fire weirds provide what aid they can while retaining the same reclusive nature and quid pro quo manners of their sister weirds.

Fire weirds favor offerings that embody positive feelings and the wishes of other creatures, such as the aged heirloom of a noble family, a kingdom's royal crown, or, ultimately, a preincarnate soul from the Bastion of Unborn Souls on the Posi-

tive Energy Plane. Fire weirds care little for the emotional or moral associations mortals place on such items, so stealing such a gift matters little to them.

Water Weirds: Great hopes of the sick and needy, water weirds grant life where only death walks, assisting those who need more than faith to survive. These weirds grant boons in the way of curative secrets and answers to overcome the unconquerable. Due to their direct opposition to many in positions of power, most leaders see water weirds as embodiments of anarchy and discord to be rooted out. In response, they remain the most secretive of weirds.

Water weirds seek rare items with healing properties, the regalia of fallen

tyrants, and secrets capable of unseating whole dynasties. The longest segment of the *Rod of Seven Parts*—capable of casting heal once per day, the noose that hung a deposed despot, or the illicit diary of an empress might all tempt a water weird.

ELEMENTAL WEIRD LAIRS

Few creatures claim to know how, where, and why pools containing elemental weirds form. Even elemental weirds themselves seem to have little choice in where they lair, with some dwelling in regions cut off or inhospitable to most other sentient forms of life. While some claim weirds simply appear in areas strong with their associated element, others propose these elementals exercise their incredible foresight when choosing a lair, selecting homes where they might someday be needed.

The lairs of weirds often take advantage of their elemental nature, while allowing limited access to allies and supplicants. Places suitable to maximize the abilities of summoned elemental protectors also constitute preferable territories.

Air Weirds: While air weirds prefer open spaces, such as wide plains or high mountains, any place with expansive open space provides the proper element for these oracles. Alternately, an air weird's pool might linger above a rocky coral reef under the great sea sky or at the heart of an enormous underground cavern—where air is most rare.

Earth Weirds: Remote wilds make ideal lairs for earth weirds. The greenery of life and death appeals to these creatures just as much as the grim, lifelessness of often-barren tunnels and lightless chasms. Mountain peaks and desert wastes also please the harsh mentalities of these weirds.

Fire Weirds: By far the most restricted by the natural appearance of their element, fire weirds prefer lairs within volcanoes or places deep within the crust of the earth. Boiling springs, geysers, and volcanic fields, as well, sometimes make comfortable homes for these prophets. Fire weirds have been known to appear in the midst of great forest fires, meteor strikes, and even blazes in communities resulting

PROPHECIES

Elemental weards are known for their mystical foresight and puzzling prophecies. The following examples show the forms of speech and type of word games to expect from the four common elemental weards.

Air

"Walk the realm of angry winds to find your fate. Raptor wings hold the keys and an angry roar shields the spirit. A kerchief comforts the bloodiest pit of lamentation, which falls to the star."

This advice from the air weird Sister Storm directs travelers through two portals to the star-shaped gatetown of Tradegate on the Outlands. The first portal is guarded by an androsphinx whose feathers act as portal keys and whose roar can deafen. The gate leads to the painfully noisy layer of Pandemonium called Cocytus, the layer of lamentation. A handkerchief is the gate key to the second portal, at the bottom of a nearby pit comprised of dark red rock.

Earth

*"When the blackened sea is stolen,
"And plague pyre fills the sky,
"And four are fortresses fallen,
"Then You and I must die.
"With eyes above the steppes,
"And a heartless iron roar,
"Night's tide eternal rises,
"Til man exists no more."*

The earth weird known as the Obsidian Duchess of Geoff spoke this forbidding rhyme, seemingly referring to some

unknown incursion from the sky, before retreating back to the Plane of Earth.

Fire

"7:19 And on the shore black madness reigns, and a bounty of gems buys discord and dark hearts. 7:20 Yet over seas of salt and wells of darkness lies sealed the sister of vice, whose lust unlocks a double death."

The much-debated "Wells of Darkness" passages from the *Etheric Scrolls*, a collection of prophecies dictated by the three fire weards together known as the Oracle of Ashes.

Water

*"Through me lies the cure.
"Wind in a crystal chalice.
"From his pride springs life."*

When entreated for aid to cure a devastating plague, the water weird called the Spirit of the Silver Stream spoke this haiku. Adventurers eventually employed the weird's portal to travel to the City of Glass on the Elemental Plane of Water. Once there, they discovered that the well-loved garden of a jann leader, Sheik Yasuf, held a rare kind of grape whose wine possesses healing properties.

Water Weards: More adaptable than most might expect, water weards occupy deep ocean bottoms, great rivers, underground springs, tiny streams, or even the occasional town well. In some cases, a great flood or tsunami has moved a water weird's pool, though just as often a weird retreats back to its home plane to avoid potential destruction.

LESSER ELEMENTAL WEARDS

A sinuous elemental serpent rises up before you, its body comprised of raging primeval force.

Elemental Blast (Ex) Once per round, a lesser elemental weird can release a

from lightning strikes. In such cases, fire weards tend to realize the short-lived nature of their surroundings and escape through their pools before the flames burn out.

Ice and Snow Weards: Ice weards commonly remain near glaciers or constantly frozen lakes, while snow weards enjoy the deep tundra (see *Frostburn*). The occasional weird might use its portal to perpetually freeze unnatural areas, such as an entire island during summer, an ancient tree that remains snow-covered year round, or a mountain perpetually covered by a glacier.

blast of elemental energy that deals 1d6 points of damage per 4 Hit Dice. The energy type of this damage differs for each type of weird: air weirds fire a ball of electricity, earth weirds expel a glob of acid, fire weirds shoot a burst of fire, and water weirds discharge a blast of incredibly cold water. The range increment for this blast is 30 feet. The type of damage dealt is the same type dealt by the weird's slam attack.

Elemental Command (Su) A lesser elemental weird can attempt to gain control over any elemental of the same subtype as it that it successfully hits with a melee attack. The elemental must make a successful DC 14 Will save or succumb to the weird's control. An elemental that saves against this attack is immune to that weird's elemental command ability for 24 hours. There is no limit to the number of elementals that a weird can control. The save DC is Charisma-based. Once under the weird's control, an elemental serves the weird for 1 day, until either it or the weird dies, until the weird dismisses it, or until the duration of its summoning expires. It obeys the weird explicitly, even if ordered to attack the being who originally summoned it. The weird does not need to communicate to maintain control over any elemental it commands.

Improved Grab (Ex) To use this ability, a lesser elemental weird must hit with its slam attack. It can then attempt to start a grapple as a free action without provoking an attack of opportunity. If it wins the grapple check, it establishes a hold and can suffocate.

Suffocate (Su) While being grappled by a lesser elemental weird a creature is deprived of air. Normally, a creature can hold its breath a number of rounds equal to twice its Constitution score before it begins to suffocate. While being grappled by a weird, a creature can only hold its breath if it makes a DC 8 Constitution check every round. Each round, the DC increases by +1. When the character finally fails its Constitution check, it begins to suffocate. In the first round, it falls unconscious (0 hit points). In the following round, it drops to -1 hit points

and is dying. In the third round, if still being grappled by the weird, it suffocates.

Elemental Glide (Ex) A lesser elemental weird can glide through the same element as its subtype as easily as a fish swims through water. Its passage leaves behind no tunnel, nor creates any sign of its presence. A *gust of wind*, *move earth*, *wall of fire*, or similar spell that manipulates elements cast on an area containing a burrowing weird flings the elemental back 30 feet, stunning the creature for 1 round unless it succeeds on a DC 15 Fortitude save.

Elemental Invisibility (Ex) As a full-round action, a lesser elemental weird fully submerged or surrounded by the same element as its subtype can turn invisible. *True seeing* and similar spells reveal these creatures as normal.

Elemental Immunities Lesser elemental weirds possess a subtype related to the element they embody. This subtype, air, earth, fire, or water, determines the damage type of a weird's elemental blast and slam attack, its immunities and vulnerabilities (see Chapter 7 of the *Monster Manual*), and its movement type.

Lesser elemental weirds are immature versions of oracular elemental weirds. Lacking the insight of true weirds, these lesser versions stay in constant contact with the elements that comprise them, letting these primal forces whisper tales and portents they might one day grow wise enough to decipher. While most commonly found on their home planes, lesser elemental weirds sometimes dwell near their mature brethren, protecting them and learning their secrets, although they might also answer the calls of other magic-users. It is thought that through some process lesser weirds evolve into true weirds, but such does not always seem to be the case, as ancient and powerful lesser weirds are not unknown.

Lesser elemental weirds exist for at least all four common types of elemental weirds (air, earth, fire, and water), and others might exist. These creatures understand the language related to their elemental type (Auran for air weirds, Teran for earth weirds, and so on), although they cannot actually speak. ☐

ELEMENTAL GUARDIAN

Conjuration (Summoning)

Level: Clr 5, Drd 4, Sor/Wiz 5

Components: V, S, M

Casting Time: 10 minutes

Range: Short (25 ft. + 5 ft./2 levels)

Effect: One summoned lesser elemental weird

Duration: 1 day/level

Saving Throw: None

Spell Resistance: No

You conjure a lesser elemental weird to guard an area you designate. Choose one of the four types of elemental weirds and at least a 5-foot area comprised of the same element. The weird cannot move more than 100 feet from that spot and cannot leave the element that it is bound to. For example, a lesser water weird tied to a point in a pond could not leave the pond or go more than 100 feet from the point it is bound to, while a lesser air elemental would have free range within a space or open air but could not fly farther than 100 feet from the designated point. The lesser elemental weird you summon appears in the spot you designate and acts immediately on your turn. The lesser elemental weird attacks any creature other than you that comes within range of its attack. If you speak the same language as the weird you can provide it with more detailed instructions, like to not attack specific individuals or members of specific races, or to only attack certain creatures. The elemental weird obeys your commands until either it is destroyed or the spell's duration expires, at which time it departs back to the appropriate Elemental Plane.

A 15th level caster can use *permanency* and expend 3,500 XP to make this spell permanent. This effect binds the lesser elemental weird to the area until it is destroyed.

Material Component: A bowl or brazier filled with an element corresponding to the lesser elemental weird you plan to summon.

THE ECOLOGY OF THE

ETTERCAP

In the darkened tangles of the deepest forest mazes, where eldritch boughs create an endless green night, hang the grasping webs of the degenerate ettercap. Gifted with the cunning patience and bloodthirsty tenacity of the spiders they so closely resemble, ettercaps are master predators and trappers with few peers. Perverted and alien, they attempt to blend in with the natural world. Parasites trying to pass as children of nature, their terrible forms and insatiable, verminous hunger for warm flesh belie their true spirits.

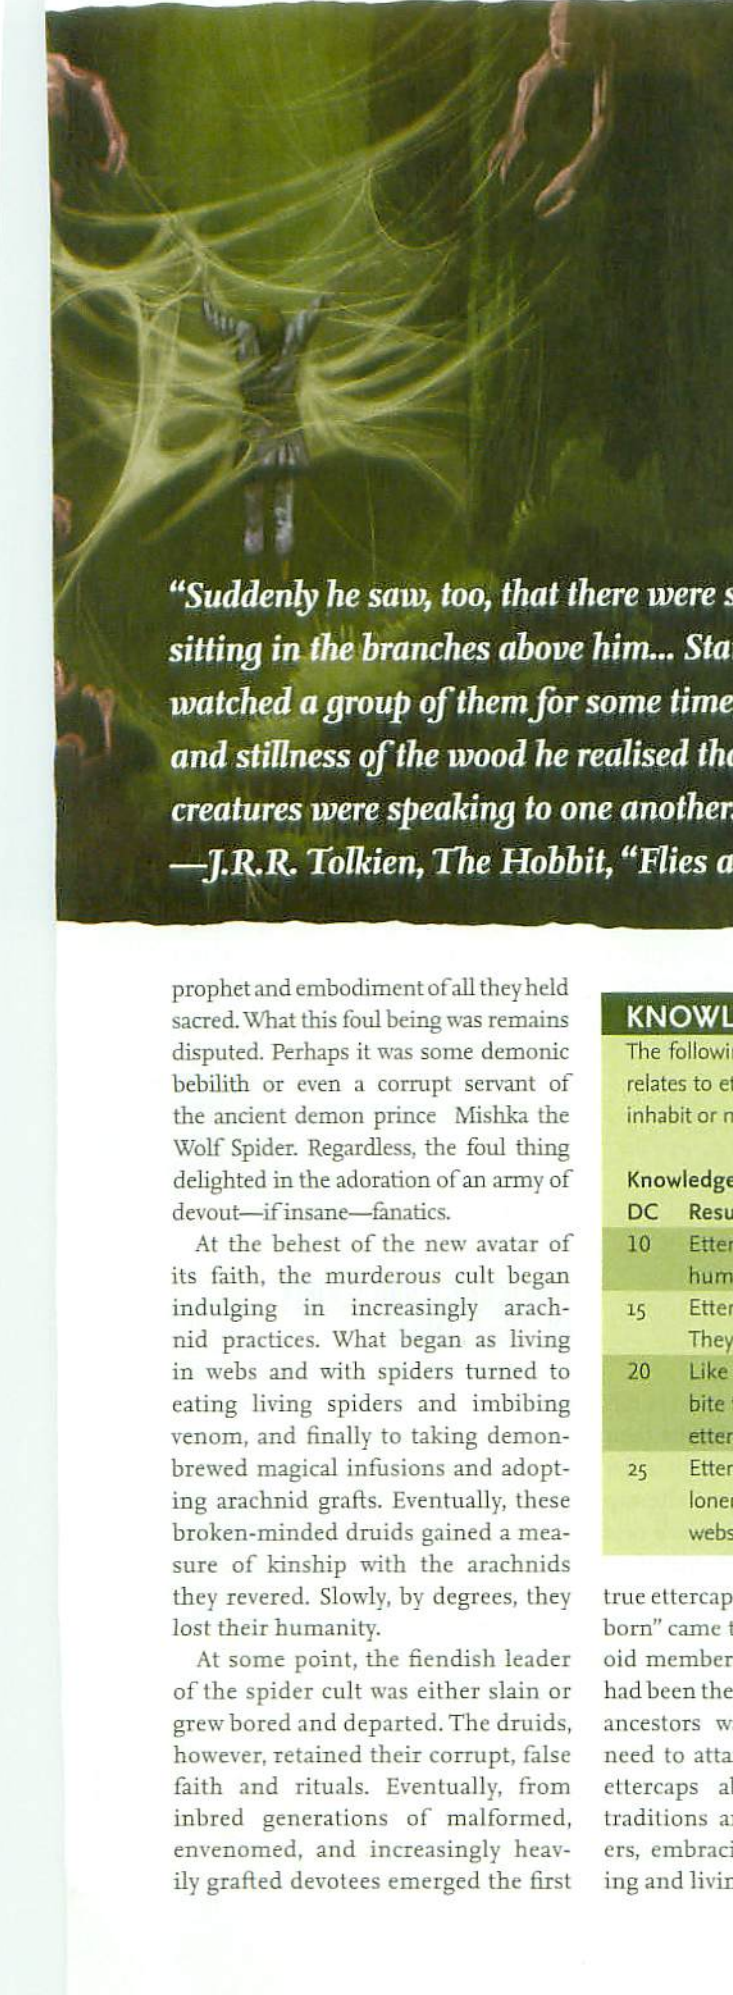

HISTORY OF THE ETTERCAP

Most people believe ettercaps somehow evolved or were magically manipulated from arachnid stock, but their horrible origins in fact occurred well outside of any natural order. Predictably, drow experimentation is often presumed in these beings' genesis, yet the worshipers of Lolth fervently and disgustedly deny the Spider Queen's involvement. The truth, however, lies less in external evils

and more in the simple, willing corruption of what was once a pure intention.

Upon great menhirs and carved upon living guardians, pulses the vast, cultic knowledge of the druids. Within their secret circles, druids worship all facets of the world's being, and for each of nature's countless aspects there are corresponding druidic rituals and inspired ceremonies. One such fragment of ancient natural lore mentions a secret cannibalistic tradition, a disgusting rite overlooked or marginalized by many nature worshipers. There were once—and some say still are—druidic sects that adhered to these natural truths of betrayal and blood. One such fleshtearing sect is held responsible for fathering the ettercap race.

These deranged druids embraced vile aspects of nature, particularly the invasive, fecund, and unkillable virtues of vermin. Thus, in a time long past, when a terrible spider fiend came upon their ranks, the druids took its presence as the ultimate validation of nature, seeing the monstrosity as a

“Suddenly he saw, too, that there were spiders huge and horrible sitting in the branches above him... Standing behind a tree he watched a group of them for some time, and then in the silence and stillness of the wood he realised that these loathesome creatures were speaking to one another...”

—J.R.R. Tolkien, The Hobbit, “Flies and Spiders”

prophet and embodiment of all they held sacred. What this foul being was remains disputed. Perhaps it was some demonic bebilith or even a corrupt servant of the ancient demon prince Mishka the Wolf Spider. Regardless, the foul thing delighted in the adoration of an army of devout—if insane—fanatics.

At the behest of the new avatar of its faith, the murderous cult began indulging in increasingly arachnid practices. What began as living in webs and with spiders turned to eating living spiders and imbibing venom, and finally to taking demon-brewed magical infusions and adopting arachnid grafts. Eventually, these broken-minded druids gained a measure of kinship with the arachnids they revered. Slowly, by degrees, they lost their humanity.

At some point, the fiendish leader of the spider cult was either slain or grew bored and departed. The druids, however, retained their corrupt, false faith and rituals. Eventually, from inbred generations of malformed, envenomed, and increasingly heavily grafted devotees emerged the first

KNOWLEDGE OF THE ETTERCAP

The following table shows the results of a Knowledge (dungeoneering) check as it relates to ettercaps. Those who study arachnids or aberrations, as well as those who inhabit or make their living in the forest, are most likely to possess this information.

Knowledge (dungeoneering)

DC	Result
10	Ettercaps are evil forest-dwelling creatures that resemble bloated humanoids with distorted arachnid features.
15	Ettercaps create and hunt with webs, ensnaring prey in their sticky folds. They surround themselves with arachnid pets and prefer to eat live prey.
20	Like many spiders, ettercaps are venomous, possessing a poisonous bite that stiffens and slows victims. Despite their horrific appearance, ettercaps are relatively intelligent and speak Common.
25	Ettercaps are skilled at climbing, hiding, and trapmaking. Typically loners, they riddle their territories with snares and traps incorporating their webs and venom, waiting until victims are defenseless before approaching.

true ettercaps. Over time, these “perfect born” came to outnumber the humanoid members of their order, and what had been the quest and religion of their ancestors was forgotten. Having no need to attain a more arachnid state, ettercaps abandoned their druidic traditions and forgot their forebearers, embracing their instincts, hunting and living as spiders, exulting and

indulging in the profane knowledge of their perverse perfection.

PHYSIOLOGY OF THE ETTERCAP

An ettercap looks like nothing so much as a disgustingly bruised, rotund, humanoid warped with arachnid features and mounted with a multitude of insectal eyes. Sickeningly pale, sagging skin covers its bloated abdomen while

ETTERCAP BROOD SWARM

Countless tiny horrors gibber and trample one another as they surge toward you, their features something between those of hairy black spiders and sickly pink newborn humans. Dozens of tiny mandibles click and chatter as they come, dripping a mixture of poison and anticipatory drool.

When it hatches, an ettercap egg sack releases a swarm of starving, underdeveloped ettercap young. These malformed, pink hatchlings attack anything to sate their fetal hunger. See page 237 of the *Monster Manual* for special combat rules for swarms.

Combat

Distraction (Ex): Any living creature that begins its turn with an ettercap brood swarm in its square must succeed on a DC 12 Fortitude save or be nauseated for 1 round. The save is Constitution-based.

Poison (Ex): Injury, Fortitude DC 14, initial and secondary damage 1d3 Dex. The save DC is Constitution-based and includes a +2 racial bonus.

Skills: An ettercap brood swarm has a +8 racial bonus on Climb checks. It uses its Dexterity modifier instead of its Strength modifier for Climb checks. It can always choose to take 10 on a Climb check, even if rushed or threatened.

splotchy pinks and purples color the rest of its body.

Ettercap physiology relies on a blend of humanoid and arachnid organs and processes. An ettercap's prominent venom-injecting fangs conceal its near-human, yet totally fleshless, mouth. Its exposed teeth allow it to chew meat, while a hidden tubelike tongue allows it to drink its prey's bodily fluids. Like a true arachnid, an ettercap drools enzyme spittle on its meals to start the digestive process. Its muscular and flexible fangs display an ability to manipulate small items, and an ettercap sometimes uses them like a third hand when crafting

traps and other items. Its clawed hands also show great versatility, despite their lack of opposable thumbs. With a few quick gyrations and clips, an ettercap quickly weaves, cuts, and casts web nets as speedily as its lower abdominal spinnerets looses strands.

Ettercaps conceive young through normal sexual reproduction, but the gestation and birth cycle results in a large external egg sack filled with scores of tiny ettercap young. These egg sacs are 2- to 3-foot ovoids, wrapped in sticky, protective webs, that allow them to be easily hung in clusters from cave walls, tree boughs, web structures, or

other easily defensible locations. Upon hatching, a process that takes nearly three months, thirty to eighty tiny, half-formed ettercap young spill forth with ravenous intent. Ettercap mothers try to keep an immobile but living food source near the eggs—sometimes storing such a creature alive for weeks—so their newly hatched young don't cannibalize too many of their siblings. If a mother fails to find suitable prey, she flees to escape her starving children, returning only after the swarm has had time to sate itself or its numbers have thinned. Thus, these swarms of mindless newborn ettercaps can threaten not just those who stumble across a web-filled ettercap nursery, but whole regions (see the Ettercap Brood Swarm sidebar). In the weeks after hatching, the number of young ettercaps dwindles through exposure, starvation, birth defects, and the predation of their parents, their peers, and other creatures. The mother collects the most promising youngsters (no more than three) and raises them until they reach maturity in four years. The rest are left to their near-inevitable demises.

An ettercap grows throughout its life, possibly attaining Large size if it lives long enough. They can live for approximately 50 years, though, violence ends the lives of most ettercaps, before age 20.

PSYCHOLOGY AND SOCIETY OF THE ETTERCAP

The ettercap's mixed arachnid-humanoid brain sets a natural limit on its emotional and intellectual capacity. Rooted in their collective consciousness, however, is a connection to arachnid life that extends far beyond shared appearance—a holdover from the druidic rites that ultimately inspired the race's creation. Ettercaps feel instinctually obligated to serve as a kind of warden to all arachnid life and to increase their own numbers. Excessive sentiment results in survival risks. Other ettercaps are only needed for breeding, and thus groups of ettercaps larger than a pair are rare. They believe that life and death serve as the only real, tangible truths, and

thus they do not recognize any deities or other moral codes. Religion and higher thought do not place victims in the web.

In some extraordinarily rare conditions, a particularly intelligent ettercap—usually a female—appears and gathers a large number of ettercaps and other arachnids around her. These leaders are often motivated, by destructive humanoid incursions and great loss of arachnid life, to strike out from their webs and stalk prey back to its home. These forays can lead to whole humanoid communities besieged by swarms of ettercaps, monstrous spiders, spider swarms, and other arachnid monstrosities.

An ettercap acts as a lone shepherd in relation to other ettercaps and true spiders. As keepers of their kind, they dispose of (eat) the weak and sick, while nurturing the specimens most likely to thrive and fulfill their intended roles in nature. Their ability to commune with normal spiders results naturally from their inherited spider traits. To an arachnid, an ettercap is just another spider. Ettercaps exude powerful pheromones and bodily resins that have euphoric effects on other arachnids and mask any hint of residual humanity. Thus, spiders are more active and seem more content whenever an ettercap is near.

THE REAL HISTORY OF THE ETTERCAP

The name ettercap can be traced to the Old English word for spider, *attercoppe* (“atter” meaning “poison,” and “coppe” meaning “head”). Middle English *coppe* (or *cob*) was synonymous for spider, as in *cobweb* or *spider web*. J.R.R. Tolkien gave this name to his intelligent spider monsters in *The Hobbit*.

DUNGEONS & DRAGONS ettercap first appeared in the original *Fiend Folio* and has been resurrected in every edition since. An Ettercap miniature also appeared as part of the *D&D Miniatures Giants of Legend* set.

Despite their isolationist attitudes and alien thoughts, ettercaps speak Common. They simply call it “The Old Tongue” and use it on the rare occasions they need to speak to one another or, more often, when they must communicate with outsiders. While ettercaps most often talk to humanoids when attempting to taunt or deceive their prey into following them into an ambush, ettercaps might try to parley their knowledge of the forest and its dangers when a superior enemy prevents their escape. Ettercaps sometimes use coins or other treasure as bait for humanoid prey, although few truly want such treasure for its own value.

ETTERCAP LAIRS

An ettercap’s lair defines the creature as much as any of its traits and abilities.

Its lair serves many purposes: shelter, food storage, and the nerve center of its trap system. An ettercap builds its cocoonlike home out of specially treated, hardened webbing camouflaged with branches and leaves and suspended from large boughs high in the forest canopy, allowing it to spend much of its time—like a spider—lying in wait.

Aside from shelter, a complex network of web strands runs from an ettercap’s lair. Some of these might connect with the lairs of other ettercaps, directly linking several ettercaps in a region to a complex webcraft community. More commonly, a single strand of webbing connects each of an ettercap’s traps to its lair. If a trap is disturbed, the strand shakes violently, alerting its creator to the disturbance.

and leading him to investigate. Ettercaps regularly crisscross their territories with such strands, which prove so light and difficult to notice that many creatures disturb the webs without ever knowing. As such, an ettercap's lair serves not just as its home but as the center of a complex web that encompasses its entire territory. A character must make a DC 18 Search check to reveal the presence of these warning webs in a 5-foot square. Characters who have gained

access to an ettercap's lair might also notice webs vibrating in alarm with a DC 18 Spot check, but they might not realize its meaning without making a DC 20 Knowledge (dungeoneering) or Knowledge (nature) check.

ETTERCAP WEB TRAPS

Insidiously imaginative and innately skilled, ettercaps are natural trap makers and create a wide range of booby traps and pitfalls. Usually incorporating

their natural webbing and leftovers bits from past meals, some of these arachnid monstrosities' more cunning traps are detailed here.

Baited Limb and Poison Spikes: The most intelligent ettercaps have noticed that a humanoid creature, wrapped tight in webs and suspended as bait from a weakened tree limb, often attracts other humanoids. The victim moves out onto the limb, which breaks, dropping him and the bait into

ADVANCED ETTERCAP

Ettercap males most often advance by Hit Dice, becoming stronger, larger hunters. Females, typically being more intelligent, might advance by Hit Dice but frequently take levels in druid, fighter, ranger, rogue, or sorcerer. The Matriarch, presented here, would be a perfect candidate for a leader instigating an attack on a humanoid community.

THE MATRIARCH

CR 15

Female ettercap druid 7/ vermin lord 4*

NE Medium aberration

Init +1; **Senses** low-light vision; **Listen** +2, **Spot** +8

Language Common, Sylvan

AC 19, **touch** 12, **flat-footed** 17

hp 100 (16 HD); 20 point swarm armor

Fort +9, **Ref** +4, **Will** +13

Spd 30 ft. (6 squares), **climb** 30 ft.

Possession *bracers of armor* +4, *dusty rose prism ioun stone*

Blood Drain (Su): The Matriarch has enlarged mandibles.

As part of her bite attack she can start a grapple without provoking an attack of opportunity. If successful, the mandibles automatically deal 2d6 points of damage each round as they suck blood from her victim. The blood drain ability only works on living creatures.

Chitin (Ex): The Matriarch has chitinous plates that grant her a +2 natural armor bonus.

Poison (Ex): Injury, Fortitude DC 24, initial damage 1d6 Dex, secondary damage 2d6 Dex.

Swarm Armor (Su): Every day, upon regaining her spells, the Matriarch is covered by a swarm of spiders. These arachnids absorb up to 20 points of damage from any damaging attack (weapon or spell). The spiders die off when then they absorb such attacks. Swarm armor has no effect if the Matriarch is wearing armor.

Web (Ex): An entangled creature can escape one of the Matriarch's webs with a DC 20 Escape Artist check or burst the web with a DC 24 Strength check. See page 106 of the *Monster Manual* for a full description of this ability.

* From the *Book of Vile Darkness* (mature audiences only).

SPIDER SPELLS

Ettercaps regularly make use of a variety of spider-related magic. Spells like *creeping doom*, *summon swarm*, *giant insect*, and various *summon monster* spells that summon monstrous spiders are particular favorites.

Spider Hand

Transmutation

Level: Cleric 1, druid 1

Components: V, S

Casting Time: 1 standard action

Range: Personal

Target: Caster's hand

Duration: Concentration (up to 1 minute/level)

You detach your hand, which transforms into a Small monstrous spider (see the *Monster Manual*) that you control. You can see through its eyes, and it can travel up to 20 feet per level away from you. If the spider is killed or prevented from returning to you, your hand is restored when the spell ends, but you take 1d6 points of damage. If you direct the spider to return to your arm (a move-equivalent action), then let the spell end, you take no damage.

the ettercap's web. The trap is even more effective if the bait is left screaming for help and the ground is planted with sticks covered in the ettercap's poison.

CR 4; mechanical; location trigger; no reset; DC 22 Reflex save avoids; 20 ft. high (2d6, fall); crude ground spikes

(Atk +5 melee, 1d4 spikes per target for 1d4+2 each plus poison); poison (ettercap poison, DC 15 Fortitude save resists, 1d6/2d6 Dex); Search DC 20; Disable Device DC 17.

Dancing Dead Man: Ettercaps create dancing dead men by filling a

humanoid husk with rocks, wet leaves, and liquid webbing. Once attached to a strong web and placed to swing into the victim's path, the device behaves as a pendulum-style giant sap that bursts upon hitting a target, covering it in webs.

CR 2; mechanical; location trigger; manual reset; Atk +5 melee (4d6 nonlethal plus liquid webbing); liquid webbing (ettercap web, DC 13 Escape Artist or DC 17 Strength check to escape; 6 hp, Hardness 0, double damage from fire); Search DC 20; Disable Device DC 15.

Camouflaged Tripping Strand: As a simple trap, ettercaps simply hide strong, braided strands of webbing across a path, causing creatures to trip and fall into a web hidden just a few feet ahead.

CR 1; mechanical; location trigger; automatic reset; Atk +15 melee touch (trip plus entangle); entangle (ettercap web, DC 13 Escape Artist or DC 17 Strength check to escape; 6 hp, Hardness 0, double damage from fire); Search DC 27; Disable Device DC 15. ☐

DUH 'COLOGY OF... DUH ETTIN!

by Ed Greenwood

From the *Trail Notes* of Raujur the Ranger:

Ettins, commonly known as the "two-headed giants," are a brutish, aggressive race of carnivores who dwell in caverns, disused mines, and the like, emerging to raid the upper world only by night. They hunt prey well in darkness¹ and subsist on raw flesh of all sorts; however, only rarely do they fight among themselves, and an ettin will only eat the meat of its own kind if it is badly wounded or sorely in need of nourishment, and no other food supply is readily available. As befits their crude and cruel behavior, ettins will typically hammer their food to a pulp, either with a weapon or by flailing the carcass against rocks, before eating it.

Ettins are largely solitary; they have no particular preference for the company of any other creature type, and the feeling is apparently mutual. A mated pair will typically stay together after mating until the offspring is born and has grown to self-sufficiency. Otherwise, ettins will only seldom gather together and live in small groups, in circumstances where an individual shows itself to be more strong-willed or more intelligent than others of its kind. Members of the leader's group will cooperate with the leader, and among themselves, as long as they perceive some gain from doing so. If the leader of such a band leaves, or is killed or discredited, the group will dissolve and each member will go its own way.

Ettins are generally stupid, but can be cunning in matters of chasing, ambushing, and fighting prey. They are wary of all other creatures — even other ettins — and slow to trust.

One fact known by everyone, of course, is that ettins have two heads. This strange property affords them some obvious benefits in combat situations; fortunately, however, their low intelligence prevents them from taking full advantage of this "blessing." The head on the right-hand side of an ettin's body is always dominant; despite folk tales and ballads to the contrary, an ettin never "argues with itself."² Also contrary to certain legends, an ettin cannot regrow a lost head; however, a one-headed ettin is well able to survive its loss and carry on a normal life, albeit without the aforementioned combat advantages and most probably

without receiving any trust or respect from its fellow creatures, who will look upon the one-headed ettin as deformed. The former disadvantage is minimal in most cases, since even a one-headed ettin is a formidable foe in physical combat. The latter disadvantage is not considered important either, because such creatures generally do not solicit or value the trust of their fellows in any event.

Typically, these creatures are not especially fluent in any single language, but use a smattering of words and expressions from whichever tongues are most predominant in their vicinity — usually orcish, goblin, and the common speech. Most of them know at least a little of the chaotic evil dialect, and ettins often consider this their “own” language. In some areas of the world where ettin populations have established themselves and resided for a long time, the creatures have developed a debased dialect of the orcish tongue into a language that can truly be called their own.³

A female ettin will bear a single offspring seven months after mating, and such young typically grow to full size in little more than a year.⁴ Female ettins are always long-haired, and generally more full-bodied than the males, whose frames are relatively gaunt and wiry except for the exceptionally broad shoulders which are (for two obvious reasons) a hallmark of the species. Neither the male nor the female takes any care over personal appearance, but females like to wear jewelry as a status symbol — perhaps

to display their hunting prowess and thereby prove themselves attractive to a prospective mate; females may gain their finery from prey they vanquish, or as gifts from male ettins during the crude courtship ritual they practice.

Aside from the uses described above, ettins keep treasure to bargain with and to purchase the services of others for specific tasks, such as hiring a band of orcs to build a wall or a trap near an ettin lair.

An ettin has pink to brownish flesh, with calloused hands and feet that carry a yellowish tinge. Its complexion often looks darker than it actually is, because the creatures are habitually covered with dirt and filth. The clothing of an ettin, if such a term can be used, comprises nothing more than scraggly, filthy animal-skins. The creatures care nothing for the appearance or odor of such garb, and wear it only for the warmth and comfort it affords them when sleeping on cold, rough stone. Such garments never have sleeves or other accessory parts, for ettins don't want to be hampered in a chase or a battle by mere sleeping-furs.⁵

Ettins have no finesse, or the desire to have any, when it comes to physical combat. They fight with crushing and battering weapons such as spiked clubs and iron bars. They have been known to throw rocks⁶ if no other weapon is immediately at hand, and they will not hesitate to rip apart furniture or uproot small trees to fight with. Their outlook on combat is as crude as their tac-

tics; ettins know nothing of honor, fairness, or truces.

But the two-headed ones are not imprudent, and will not take on obviously superior foes if escape is possible. They will bargain with all intelligent prey if they think more food will be gained by doing so — but if the bargaining gets unpleasant or frustrating, they may abruptly decide that a snack in the hand is worth a feast in the bush. At any rate, ettins do not feel bound by agreements reached by bargaining — they seek only to get what they want, and as much of it as possible, while incurring the least risk to themselves.

Ettins worship a deity that is similar, or identical, to the one the hill giants know as Grolantor, though they usually do not call the deity by this name. They view their deity as a gigantic ettin of great intelligence and wisdom (as well as superior fighting prowess) whose two heads enable him to maintain an eternal vigilance against all who would seek to subjugate or destroy the ettins. The similarity of their deities suggests that ettins and hill giants had some common social or cultural aspects at one time, but the two species have no affinity for each other nowadays. It is possible that ettins and hill giants came from the same stock, given their common religious background and their larger-than-human size, but ettins on the average are substantially taller and thinner than hill giants. In facial appearance and body structure, ettins seem more closely related to orcs — yet that species only grows to half the size of ettins. And, of course, neither orcs nor hill giants have two heads; because of this unique anomaly, it is quite likely that the genetic background of the ettin will never be fully known.

As my friend and fellow ranger Athscar puts it: “An ettin is a nasty brute — murderous in a face-to-face fight if one is unlucky, injured, or weighed down, but easy prey to a well-armed band of three or more who keep their wits about them and meet the monster on ground of their choice.”

Notes

1. Ettins have keen senses, well adapted to night hunting: infravision out to a 9” range, and a sense of smell sufficiently developed to distinguish animal, unusual, and specific, known-to-be-dangerous scents from those of the surroundings within 3”. They dislike sunlight or other strong light (continual light, but not a torch or a light spell) intensely, but it does not harm them or impair their fighting abilities. The dislike comes from habit and conditioning, and their self-preservation instinct; they inhabit darkened, hidden places because of their solitary nature. They greatly prefer to hunt at night so as to take full advantage of their keen senses, and to reduce the chances that they themselves will be set upon by adventurers or other adversaries. Apparently, the orcish strain in their makeup is not strong enough to require them to fight at a penalty in lighted areas.

2. The ettin derives some unusual protection from its dual brains. Spells of mental control, such as *sleep*, *fear*, and any *charms* or *hold* spells, will not completely affect an ettin unless two spells of the same type are cast upon it, either simultaneously or one after the other so that both spells are in effect at the same time. Of course, both spells must succeed; for magics of this sort against which a saving throw is allowed, each head is entitled to a save against one of the spells. If one but not both spells succeed, the unaffected head will assume control of the body without pause or internal struggle, and the affected head will be held powerless until it regains its normal state (at the expiration of the spell's duration). If the affected head is the dominant (right-hand) one, it will immediately resume "control" after returning to normal. During this time of powerlessness, the arm closest to the affected head will hang limp and useless; it will not drop anything it is holding, but cannot consciously use or wield such an object and could (under the right circumstances) be easily disarmed or disengaged from the object by the application of some force (a list or weapon blow, for instance) against either the arm or the object.

Note that *repulsion*, *mass charm*, *psionic domination*, and other "group-effect" magics and powers will affect both heads of an ettin upon a single application; if a saving throw is allowed in such a case, the creature is only entitled to one.

If the ettin's dominant head is destroyed or severely damaged in a fight, the creature will be *confused* for 1-6 rounds, after which time the single functioning head will gain control of the "opposite" arm — but that arm will only be capable of wild (empty-handed) flailing until the ettin learns to control both arms with its single head. This process takes 1-2 months to run its full course, after which time control is perfect and both arms can attack normally. Damage figures for both arms (2-16 for the left, 3-18 for the right) will not change, regardless of which head is controlling both of them.

Because of its low intelligence, an ettin saves against all types of *illusions* at -1 — but each head is entitled to a saving throw, and if one or both of them are unaffected by the illusion, the ettin will be enraged at such a trick, not bewildered at its occurrence, and will angrily seek out its perpetrator.

3. Any creature who is conversant in orkish will be able to understand 60% of what is said in this "ettintongue." Ettins often howl and slobber in bestial rage when in pain or frustrated by nimble foes.

4. The offspring of a pair of ettins has no combat ability until it attains six months of age. From that time until it reaches one year old, the young ettin is size M (5' tall) with 4 HD and does roughly half damage on an attack with either arm — 2-8 (2d4) with the left and 3-8 (1d6+2) with the right. At the age of one year, an ettin is quite able to fend for itself, and will either be aban-

doned by its parents or simply treated as another member of the group.

5. The skins worn by an ettin are uncured and rotting, and typically carry parasitic diseases; see the DMG under this heading.

6. Rocks thrown by an ettin do 2-12 points of damage per hit, with range figures of 2", 4", and 6"; each arm can throw one rock per round. Note that this is not an ettin's preferred attack mode, and the monster will always use some sort of hand-held weapon if one is available.

7. See the DEITIES & DEMIGODS™ Cyclopedia for details of Grolantor. The deity is usually known by a slightly different name, such as "Grolettinor" or "Grelinor," among the ettins that revere or worship this figure. A very few ettins rise in service to their deity to become 3rd-level shamans; see the DMG, p. 40, for details on what spells are available to them.

The Ecology of The Eye of the deep

by Ed Greenwood

Compiled from a discussion at a meeting of sages in Hillsfar led by Auvras the Enquirer:

The eye of the deep is a creature of legend; though it truly exists, few trained observers have seen it, and fewer still have studied it at length in its habitat, the ocean depths. Several among us tonight have done so, and can answer many mysteries.

Many have speculated that the eye of the deep is related to the beholder, and it is our considered opinion that it is indeed a related species; perhaps both were once the same creature and evolved differently to master then vastly different environments.

The eye of the deep is a solitary predator, catching most of its victims by use of its power to stun its prey with a blinding flash of light from the large eye in the center of its roughly spherical body. Even if prey is not thus immobilized, the eye of the deep can bring its two large pincers into play to grab and rend its victims.¹ These pincers can shred creatures much larger than the "eye" itself, and octopi, giant squids, and the huge cruising fish of the depths form the bulk of the creature's diet. It prizes most highly sinking ships, for it breaks into the disintegrating hulls of these (aided by the intense pressure of deep water), and dines upon the tasty bodies of surface creatures trapped inside. It cannot rise into shallow waters after such prey, because the less intense water pressure at shallow depths causes its body (and internal gases) to expand, and ultimately explode apart. (For this reason, the corpse of an "eye" reaches the surface very rarely; the distorted fragments of its rent body sink back to the bottom, or are devoured by shallow-water marine life.)

To compensate for their inability to travel in shallow waters, eyes of the deep sometimes cooperate with sahuagin for short periods and specific undertakings, usually demanding as payment the bodies of many surface dwellers. (This dietary preference is one of the many hints at a common origin of both the eye of the deep and the beholder.)

Metallic treasure is often ingested by an eye of the deep, but does not harm the creature, and remains in its stomach until it accumulates to uncomfortable proportions, whereupon it is regurgitated forth in the eye's lair. All eyes make themselves a lair in an undersea grotto (slaying any previous occupants, if necessary) far from the

lair of other eyes of the deep and as near to abundant food as possible (such as beneath heavily traveled shipping routes, or in areas of storms or shoals). An eye may well have its lair guarded by lesser creatures, or by traps (falling nets weighted by stones, and so forth) such as it can manage. An eye's claws are quite dextrous and can shear through nets, ropes, and the like with speed and accuracy.

Eyes are aggressive, deceitful, and totally self-interested; "loyalty" has little meaning for them, and they will cooperate with creatures of like alignment only when they stand to gain much prey, or are coerced into doing so. Eyes avoid other eyes purely for reasons of practicality, not desiring to die or be badly wounded in a tough fight with an opponent of equal powers. It should be noted here that the admittedly few observations of such battles indicate that an eye can be affected by another eye's illusions, but each is immune to another's stunning power. Eye-

stalks can be regenerated in six to eleven days when lost, and other body parts (such as its pincers or central eye) regrown in a matter of months — but the rapidity of such growth depends upon the amount of prey an eye can consume, and a seriously wounded eye is a poor hunter due to its slow natural speed.

Eyes of the deep are highly maneuverable when swimming, due to their many underside "feelers" — flexible, sticky body strands which can act as paddles when swimming, "walk" along rocks or other solid objects, hold prey, and so on. An eye grows new feelers constantly, and feelers are continually lost or damaged by its activities, so that an eye's underside is a tangled

forest of whitish, mauve-mottled feelers, all of differing lengths and diameters. Hidden amongst the many feelers are a few "strands" devoted to reproduction — long feelers which hold the eye's eggs like peas in a pod.² Periodically these egg-holders rupture, depositing their cargoes on the ocean bottom or in the powerful currents of the deeps. Any other eye of the deep can fertilize these eggs; the creatures are bisexual, but cannot fertilize their own eggs. (An eye

will fertilize another eye's eggs instinctively whenever it recognizes the eggs for what they are.

Fertilized eggs fall to the ocean bottom, if they were not there already, and lie there until they hatch or die. Few fertilized eggs survive to see the end of their maturation period, because they are seldom left undisturbed by other denizens of the deep. Fewer still are fertilized in the first place, since they can only be left adrift for two months after being released from the nutrient-rich "strands"; after that time they become inert and infertile. For these reasons, few eyes of the deep are born, and this monster is thankfully very rare.

Hatchlings are rapidly dispersed by ocean currents and typically hide, feeding on bottom life, carrion, and small fish for a year or more, slowly growing to full size and powers. As an eye grows, it actually splits its skin, shedding the tough, chitinous outer armor plates of its body to reveal soft, new, larger plates within. It eats discarded plates to regain lost body minerals and begin building a new layer of plates within itself once more. When an eye reaches physical maturity, its body processes shift to regeneration rather than continual growth. Thus, lost or damaged plates are repaired by the secretion of new material from within. Young eyes cooperate with other creatures more readily than do the more wary older ones. An eye can communicate with all other intelligent creatures by means of telepathy.

Perhaps the most fascinating and dangerous ability of an eye of the deep is its mastery of illusions. These it can create and hold with practiced concentration, for a literally unlimited duration (since eyes never sleep). Such illusions will end when the eye wills it, or when one of its eyestalks is blinded by battle damage or some other mishap (apparently, both must be intact for it to create and focus clear illusions), or when one or both of the eyes is used for its other purpose (the magic of hold person and hold monster spells).

An eye can move its created illusion about, and the image appears three-dimensional. An eye can remain in hiding and manipulate an illusion it cannot see. This skill is assumed to be simply a result of practice; the creatures employ illusions constantly from maturity to death (improving their skill as they age), except for the few times when their eyestalks are incapacitated or otherwise occupied. A typical tactic of the creature is to lure prey to its vicinity with an illusion and then use the light-blast of its large central eye to stun the victim.

Notes

1. Intended victims of the eye-flash stun must save vs. poison to avoid its effects. Targets that are blindfolded, hooded, or unable to see in the visible spectrum cannot be *stunned*. A *darkness* spell will provide an effective screen against such flashes. However, most defenses require more time to put in place than the stunning flash of the

eye requires to "fire"; and an eye of the deep will recognize any defensive preparations for what they are. Any physical strike against a creature *stunned* by the eye-flash is made at +4 to hit; the victim cannot attack or defend itself, and AC bonuses for shield or dexterity do not apply. A *stunned* victim is effectively incapacitated for the duration of the effect (2-8 rounds, determined separately for each victim).

The effect of repeated eye-flashes is not cumulative; a stunned victim cannot be "more stunned." The creature can use its *stun* power for as many as five rounds in succession, but then must rest the eye-flash power for an equal number of rounds before it can be used again.

The eye of the deep can use its physical attacks (pincers and teeth) in the same round that it emits an eye-flash. It will go after *stunned* creatures in preference to other nearby prey only if it thinks that the "unstunned" targets (those that made their saving throw) present no immediate threat to itself. The creature will attempt to grab prey with one or both of its pincers and then bring the victim up to its mouth. A bite attack is made at +2 to hit against a victim held by one pincer, or at +4 to hit against a victim held by both pincers — and such a victim can only attack back at a corresponding penalty (-2 or -4). If the creature takes damage in a given melee round, it will release its hold on anything in its pincers; otherwise, prey that is held by both of the pincers will continue to take 2-8 points of damage from each pincer until it dies or the hold is broken. A victim held by only one pincer can (if not *stunned* or otherwise immobilized) wrest itself out of the pincer's grasp and must then be grabbed anew. An eye of the deep will attack prey that is considerably larger than itself (such as a giant squid), but is intelligent enough to only do so when it has an advantage and is not in immediate danger of being severely hurt itself.

2. All of the feelers except for the few reproductive "strands" can be made sticky by the secretion of a glue-like fluid, and made "un-sticky" by the emission of an alcohol-like solvent that counteracts the glue. The former process requires one round and must be performed before the feelers can be used to manipulate objects or provide traction on a solid surface. The latter process takes only one segment and must be performed before the creature can again use the feelers to help it move through the water. The feelers can grab and manipulate any object as large and heavy as a human body, but the creature cannot hold such an object and move under its own power at the same time; as such, the feelers are almost exclusively used either for locomotion, or to anchor the eye of the deep to a solid surface while it awaits the approach of prey.

The reproductive "strands" have none of the properties of the other feelers. They are very few in number (3-6 out of a total of 60-90 feelers) and are continually replaced or

regrown like the other feelers. Once every two months, an egg is produced in each strand; when a strand accumulates 6-11 eggs, it splits open lengthwise and deposits the contents into the surrounding water. Each egg is spherical, about 6 inches in diameter, with a tough but flexible shell that enables it to withstand water pressure and moderately hard blows without cracking.

3. Only 50% of all fertilized eggs actually hatch (and only 20% of all eggs released by an eye of the deep are ever fertilized). Hatchlings are weak swimmers (3"), M-sized (2-foot diameter), with 2+4 HD. They have only 11-20 feelers and no strands, and their pincers and teeth are softer and weaker (1-6/1-6/1-4 damage) than those of full-grown eyes of the deep. Their *stun* attack lasts for only 1-4 rounds, and targets get a +2 bonus to their saving throw to avoid the effect. Young creatures cannot create *illusions* or use the *hold* powers of their still-immature eyestalks. At the age of one year, an eye of the deep specimen will have 8-10 HD, move 4", and the full range of attacks that a mature creature has, with a 3-foot-diameter body and 40-60 feelers, but still no strands. Full physical maturity is attained within 2-3 years after hatching.

4. The *telepathy* ability of an eye of the deep will work on any creature of *animal* intelligence or higher within a 6" range. Eyes of the deep know the tongue of lawful evil, and usually sahuagin, ixitxachitl, common, or (5% chance) some other tongue. Knowledge of these languages is acquired by telepathy; an eye of the deep cannot understand or communicate with a creature that is using a language the eye does not know.

5. The illusionary image created by an eye of the deep is equivalent to a *phantasmal force* with a range of 18" and an area of effect equal to a 6-foot cube or equivalent volume (enough to simulate an M-sized creature or a small school of fish). Any creature of average or higher intelligence that attempts to disbelieve such an illusion obtains a saving throw, and if the save is successful then that creature can add +4 to the saving throws of companions (cf. *phantasmal force*, Players Handbook). An eye of the deep can sense vibrations or unusual currents in the water emanating from as far as 36" away; the creature has infravision out to a range of 12" and can smell blood or sweat in the water from up to 9" away.

The *hold person* and *hold monster* powers of the creature's secondary eyes are treated as spells from a 6th-level magic-user for determination of range and area of effect. Each of the secondary eyes has one of these spell-like powers, i.e., either one cannot use either power. The eye of the deep can employ one or the other of these powers in any given round, but not both in the same round, and can use each power as often as three times per day. Remember that whenever the eye of the deep uses one of its *hold* powers, it cannot *create illusion* at the same time, and any illusion that had existed is dispelled.

The Ecology of the Froghemoth

By Jonathan McAnulty

Art by Michael Jaecks

Cairl Walker stumbled back in panic as the monstrosity rose out of the water. Droplets rained down as the creature heaved itself up, tentacles flailing. They had warned him of the swamp, its hidden dangers and unnatural beasts, yet he had never anticipated such a thing as stood before him. It towered as tall as the trees, and its mouth was like a fanged pit.

Cairl looked right and left, thinking that if he could just rush far enough away from it, he could evade it. He was wrong. Before he could run the creature's tongue unrolled from its mouth, a fifth tentacle that lifted him in the air. In seconds, he had disappeared down the cavernous maw, another victim of the froghemoth.

Sages spend long hours speculating on the history of the bizarre creature commonly called the froghemoth. Some learned scholars insist such a monstrosity must be the result of arcane experimentation. Others point out that it can be found in the deep places of the earth, suggesting some eldritch mutation shaped by dark energies seeping in distant caverns. Yet the bizarre tale of the froghemoth does not begin either on or under the earth.

In truth, the monster is a child of the stars; a creature inadvertently brought to the known world aboard a doomed vessel in an age long past. Its home world a hot, swampy land filled with volcanoes and violent lightning storms. Though the froghemoth was biologically well suited to its new, gentler environment, as a race, the creature became the servant of a restless anger; some say they are homesick.

Today, the monstrous aberrations have expanded their range across the planet, both above and below the ground. They make their homes wherever the water is warm and fresh and they can lie comfortably submerged, waiting for an opportunity to vent both anger and hunger.

Physiology

While froghemoths share some similarities with mundane frogs, those who have studied the massive amphibians realize the similarities are largely superficial. While a froghemoth at rest – with its webbed rear feet and tough, warty skin –

might be mistaken for a great frog, once the creature begins moving, any observer can tell the two are entirely distinct creatures.

Locomotion

For one thing, froghemoths are not natural jumpers. Swimming is their preferred method of locomotion. In the rare cases when a froghemoth is encountered on dry land, the great beasts often crawl: their tentacles grasping ahead, pulling their massive bulk slowly forward as their rear legs push. Such movement is deceptive, suggesting clumsiness rather than mere laziness. A froghemoth can stand and walk bipedally, and in battle, it is found upright more often than not. The sight of such an abomination walking is even more disturbing than a four-legged motion might be.

Froghemoths are amphibious. In their early lives, they are aquatic, but as adults they develop powerful lungs and breathe air. The four upper appendages of a froghemoth, though often called tentacles, are properly considered arms. Like your tongue or the arms of an octopus, the arms of the froghemoth are muscular hydrostats. That is, they are limbs comprised entirely of muscle and contain neither bone nor major blood vessels. These limbs are strong and flexible, capable of strangling and crushing massive prey.

Senses

The head of the froghemoth is dominated by a single central eyestalk possessing between one and three keen eyes. The number of eyes seems to make little difference to the ocular abilities of the froghemoth, which are impressive.

The pipe-like nostrils of the froghemoth are also distinctive to the monster. The tips of these nostril tubes are often frilled, so when the froghemoth is submerged, with only eyes and nostrils above the water, the nostrils resemble floating vegetation. Froghemoths can collapse these tubes, retracting them into their skull, and will often do so when moving over dry land. The ears of a froghemoth are internal, designed for listening below the water, rather than above it.

Teeth and Tongue

Inside the froghemoth's mouth we find two more items worth mentioning. The first is that, unlike most amphibious creatures, froghemoths have razor sharp teeth. As the froghemoth typically swallows its food whole, its teeth are mainly defensive. Nevertheless, in areas lacking small prey, a froghemoth is quite capable of tearing apart larger creatures and swallowing them piecemeal.

Secondly, the mouth of the froghemoth contains a long, elastic tongue, perhaps the most frog-like quality of the beast. This tongue is fastened to the front of the froghemoth's mouth and is normally kept rolled up inside the creature's head, though it can reach down its own throat with its tongue to dislodge food or items stuck there. When hunting, the froghemoth uses its tongue as a fifth limb, attacking, grasping, and pulling victims into its mouth to be swallowed.

Adventurers report that froghemoths often lick objects of interest. It uses its tongue to examine potential food and new objects—even, at the appropriate times, potential mates. Indeed, the creature uses its tongue for smell, taste, *and* touch since the tips of its arms are not particularly sensitive.

The final physiological feature of the froghemoth worthy of discussion is its nervous system. The nerves and spinal cord of a froghemoth are prodigious in size and conduct massive amounts of electricity from brain to limb. These powerful electrical charges allow the monster to react with a speed that belies its size. This also explains the creature's curious reaction to electrical attacks. Though the nerves of the froghemoth can absorb and conduct any amount of electricity, electrical attacks from outside the body confuse the creature's muscles as they try to distinguish between the charges sent from the brain and the foreign signals; thus, the apparent slowness of the creature when struck with electrical attacks.

Life Cycle

Froghemoths dwell in fresh water environments in warm and hot climates. Generally, they make their homes in swamps, but they can also be found living in the shallows of a warm lake or along the banks of a slow-moving river. Each froghemoth has a territory of four to nine square miles, which it considers its own. For most of the year, it instinctively avoids the territories of other froghemoths.

The exception to this rule is during the mating season. Froghemoths feel the compulsion to mate in the early spring or during particularly rainy spells, and they leave their homes in search of a mate, often wandering many miles. This accounts for most froghemoths encountered out of the water.

Although froghemoths hunt less during the mating season, they are more aggressive, and they often form mating pods of two to six. Froghemoths are hermaphrodites and,

A

B

C

A FROGHEMOTH EGGS

B WOGHEMOTH

C TADHEMOTH

following their two-week long unions, each of these mating aberrations lays between 10 and 100 eggs—in the still waters, no more than 6-10 ft. deep.

Eggs Hazards and Hatching

The quirks of the froghemoth's nervous system are most readily apparent in the beast's juvenile forms. The froghemoth eggs, each about 1 ft. in diameter, constantly release pulses of electrical energy into the water around them. Combined with the slimy gel holding the eggs together, this pulse makes froghemoth eggs a very real hazard for any creature passing through the waters nearby.

The eggs incubate for two months before they hatch, releasing newborn froghemoths into the world. Newborn froghemoths are ravenous, and they consume their eggshells, then the slime holding the shells, and then any unfortunate creatures caught in the slime. This is not the end; they then turn on each other. Coupled with the willingness of older froghemoths to eat their own young, this cannibalism helps insure their numbers are never too great.

Woghemoth

Froghemoths pass through two distinct larval stages before they are considered mature. The first larval stage is called the woghemoth stage. (The waggish scholar who first studied the froghemoth and was thus responsible for naming them originally called this stage the pollywoghemoth but later generations shortened the name.)

The woghemoth looks a bit like a pale eel with two rear fins and four pectoral fins. It mindlessly hunts anything that moves, using its unusual electrical abilities to help it stun potential prey.

Tadhemoth

After about 6 months of growth, the woghemoth enters its second larval stage, that of the tadhemoth.

At this point, the pectoral fins have become stubby tentacle looking arms, and the tongue of the tadhemoth has developed enough for it to pull food into its fanged mouth.

Normally, by this stage the juvenile

froghemoth has lost the ability to discharge electricity. As the tadhemoth grows, its rear fins morph into legs, its tail shortens through apoptosis, and its tentacles thicken and lengthen.

A froghemoth reaches maturity by 3 years of age although the creature continues to grow all of its life.

Froghemoth Eggs

The small globes, just visible under the brackish water, are black, leathery looking, and approximately a foot in diameter. Piled in a heap, they seem held together by a yellow slime. A fish trapped in the slime quivers spasmodically every few seconds, near death and in obvious distress.

Froghemoth Eggs (Hazard) CR 2 600 XP

Froghemoths lay 10-100 eggs at a time, and the eggs are held together with a glue-like slime that serves three functions. The slime reacts with the water the eggs are laid in, producing a brown aquatic cloud extending 15 ft. from the eggs, similar to muddy water. All perception checks made to spot items in this cloudy water take a -8 circumstance penalty. Spotting the eggs requires a DC 20 Perception check.

The slime's second function is that it traps potential food. Any creature – other than a froghemoth – coming into contact with the slime is held fast. Breaking free from the slime requires a DC 15 Strength check.

The slime's third function is to serve as a conduit for the egg's electrical charge. Every 5 rounds, the eggs release a charge. Any creature within the slime when this charge is released must make a DC 14 Fortitude check or suffer 1d4 Strength damage. Each egg has 6 hp and hardness 2. In a group of fewer than 10 eggs, the electrical discharge is not strong enough to affect creatures of Small size or larger.

Woghemoth

In addition to the two long, feathery fins streaming from the rear of this eel-like monstrosity, four fins radiate from the pectoral area of the pale-white body.

Though eyeless, the creature flashes unerringly through the water towards its potential meal, opening a mouth filled with razor sharp teeth. As it swims, electricity crackles along its fins.

Special Abilities

Electrical Discharge (Ex) As a free action, once every 3 rounds,

Electric Froghemoth

A rare few froghemoths retain an electrical attack into maturity. When these froghemoths hit with their tentacles, they release an electrical discharge, which can stun an opponent. In addition to the normal damage done by the tentacle, the target of one of these attacks takes 2d6 points of nonlethal damage and must make a DC 15 Fortitude save or be stunned for 1d6 rounds. This save DC is constitution-based. Such froghemoths have a CR of 14.

a woghemoth can emit a powerful electrical discharge. This must originate in water but affects all creatures within 15 ft. of the woghemoth. Any creature struck by the discharge takes 1d6 nonlethal damage and must make a DC 11 Fortitude save or be stunned for 1d6 rounds. Woghemoths, tadhemoths, and froghemoths are immune to these electrical discharges. The save DC is Constitution-based.

Slowed by Electricity (Ex) While woghemoths take no damage from electricity, electrical attacks other than their own confuse them, and they become slowed for 1 round.

Tremorsense (Ex) A woghemoth can sense any movement in the water within 30 ft.

Tactics

Woghemoths employ straightforward tactics and attack almost anything that moves through their waters, including (in times of poor hunting) each other. As they charge in, they release their electrical attack.

As soon as they are injured they flee, but combatants should not be fooled into thinking a fleeing woghemoth is defeated. They mindlessly charge in a few seconds later, as soon as they have built up another electrical charge.

Advancement and Growth

Woghemoths begin life approximately 2 ft. long. If they are not eaten by their siblings or by predators, they grow about 1 ft. per month until they reach 8 ft. long. For each foot of growth, a woghemoth gains another HD and an additional point of Strength.

A 3-HD woghemoth is a Medium vermin: its bite attack improves to 1d6 damage and it loses a point of Dexterity. As a woghemoth grows, its skin darkens and its pectoral fins begin the process of elongating into tentacles, but regardless of their appearance, these appendages are useless in combat.

Tadhemoth

Like some strange tentacular shark, the tadhemoth darts towards its prey. Its eye fixes straight ahead, and its tentacles lash out at the frightened target, grabbing and

pulling its meal towards its fanged maw.

Special Abilities

Amphibious (Ex) A tadhemoth can survive either in or out of water although they have more difficulty on dry land.

Slowed by Electricity (Ex) While tadhemoths take no damage from electricity, electrical attacks other than that of a woghemoth confuse them, and they become slow for 1 round, as if affected by the spell *slow*.

Tactics

Tadhemoths hunt with slightly more intelligence than their more juvenile counterparts. Though they will still attack anything they think

CR 5

they can eat, they are more stealthy and cunning in their attacks. The tadhemoth's preferred mode of attack is to approach potential prey from behind.

Once prey has been ensnared and swallowed, the tadhemoth will attempt to break off any combat, retreating to deeper waters to swallow and digest its meal. As tadhemoths fight only for food, they break off any combat in which they take more than 50% of their hp in damage. Tadhemoths rarely attack entities that they remember as seriously hurting them, preferring to seek easy prey.

Advancement and Growth

As tadhemoths age, they continue to grow, reaching maturity at three years of age. A tadhemoth gains an additional HD every 3 months. As they grow, their rear fins morph into legs and their tail thickens. At 12 HD, their land speed improves to 20 ft.

Ecology of the Fire Archon

by Matthew Sernett

"Souls made of fire, and children of the sun,
With whom revenge is virtue."
--*The Revenge*, Edward Young

Living flames forged by blazing magic, fire archons exist to destroy. Overrun and consume, take all and leave nothing but ashes -- these are the desires that burn within fire archons' incandescent souls from their first moments. Always hungry for conquest, these elemental mercenaries work for anyone with power and the promise of many victories.

History

In an ancient time, when the world had hardly been formed, primordial beings battled the gods for control of creation. In this cataclysmic conflict, the deific host marshaled armies of angels and cadres of exarchs, and though the primordials could call forth titanic beasts and their giant children, they could not muster a true military to face their enemies. To match their foes, the consummate creators gave being to a means by which elemental creatures could be recreated -- reshaped and hammered into soldiers. The warriors formed through this process were the first archons.

Fire archons believe that the honor of being the primordials' first soldiers belongs to them, but that is a secret only the gods and primordials remember. Regardless of which type was first, the presence of the archons turned the tide of battle in the primordials' favor. Given life, the archons could reproduce themselves, building armies faster than giants could be born or angels ordained. Their uncontrolled creation pleased the primordials and worried the gods.

Thus it was that one deity devised the plan that would starve the archon armies of troops. Rather than combat the archons directly, the gods' forces attacked the creatures and energies that served as the archons' source. To create an archon, one needs another elemental being. Virtually any kind will do. That creature is then remade into an archon in a magic foundry built upon a well of elemental power. The angels, exarchs, and gods set about destroying any elementals they encountered and diverting or ruining the largest sources of elemental energy in the Elemental Chaos.

Some reshaped the elemental spirits rather than destroy them. Medusas are said by some to be earth spirits reformed by Zehir. Others blame doppelgangers upon Sehanine's reshaping of water elementals. Yet the vast majority of elementals were slain. Whole races were snuffed out or driven so far to the brink that none have seen one of them to this day. Efreeti remember this time as the Desolation in their legends, and they believe that the Elemental Chaos still hasn't recovered.

The gods might have done more damage, but their defeat of the primordials made continued conflict wasteful. Without the gods' forces to fight, and with no clear direction, the archons began to clash with one another. Some

fell into ranks behind powerful archon leaders. Others aligned with powerful children of the primordials who tried to fill the power void left by their creators. The once innumerable archons ground down their number and might have disappeared altogether had not some races, such as the efreeti, preserved the means for their renewal.

Today, archons are just one type of creature among the countless beings that inhabit the Elemental Chaos. Their numbers wax and wane as different armies of archons go through cycles of creation and conflict, flaring up and burning themselves out as they prepare for war and engage in it.

Knowledge of the Fire Archon

The following table shows the results of a Knowledge (the planes) check as it relates to fire archons. A result provides the information at the given DC and the information from all lower DCs.

DC Result

- 12
- Fire archons are a warlike race of fiery elemental beings. Roughly humanoid in shape, they wield weapons and wear armor.
- 15
- There are other archons consisting of other elemental forces. They seem similar in many respects besides the elemental material encased in their armor.
- 20
- Unlike aimless elementals, fire archons have a militaristic culture based on continual conquest. This seems to be true of all fire archons from the moment of their creation. Other archons are militaristic, but none are as rampantly destructive as the fire archons.
- 25
- Fire archons can be created through a difficult ritual involving the use of a special forge built upon a concentration of elemental fire. Once created, a fire archon owes no fealty to its creator, but a person with the power to subdue the fire archon can control it through intimidation.
- 30
- Fire archons were created by the primordials in their war against the gods. The secret of creating fire archons was stolen by the efreeti and it disseminated from them to others. Most fire archons are now either created by other fire archons or the efreeti. When archons created by the efreeti build upon and alter the lands they conquer, they try to recreate the greatest of the efreeti cities, the City of Brass.

Physiology

Fire archons exist as creatures of living flame, but their bodies aren't so mutable as a flickering fire. Every fire archon has two arms, a torso, and a head. Their lower bodies take the form of single conflagrations rather than separate legs.

Despite lacking a skeletal structure, their upper bodies conform in motion to human norms. Their arms are equivalent to a human's, with clearly positioned shoulders, elbows, and hands. Fire archon fingers seem to blend together into a mittenlike form or separate into true digits depending on their need. Whether this is due to the obscuring effect of the flames or a true joining of fiery flesh is unclear, but no fire archon has ever been seen to be missing a finger or limb. If such a member is severed, the fire archon instantly grows another while the severed part burns away in a swirl of fire and smoke. The only exceptions seem to be the head and the torso. Severing these parts from the body is damage sufficient to kill a fire archon instantly.

A fire archon's head has a defined front and back, but it typically lacks facial features. Brighter eyelike points can appear on their faces when they become agitated or angry, and they see as well as most humanoids. Their bodies typically provide light equivalent to a bonfire, and thus they illuminate any darkened area they enter, obviating the need for darkvision. Fire archons seem incapable of diminishing the light their bodies emit, and thus they would find hiding from foes difficult in most situations. However, fire archons aren't inclined toward stealth even when it would benefit them, preferring instead to alert their foes to their presence by sending up columns of smoke from things and creatures they burn. The lower body of a fire archon is one large flame rather than legs. As with other archons, fire archons glide about on a column of their constituent element. The exact method of this locomotion is poorly understood, but it is assumed to resemble a slug's movement, with the fire archon somehow gliding over a thin layer of super-heated

air.

Although made of transparent and flickering flames, and apparently empty of organs, a fire archon has a solid form. Those brave enough to have touched a fire archon's body describe it as being like holding a boiling bag of writhing snakes. A fire archon held in this way is certainly very hot, but it does not truly burn. The archon can set things ablaze with its body, but this seems to require some concentration -- something that a fire archon is incapable of while wrestling or in combat. This solidity gives the archon a weight roughly equivalent to an elf of similar stature, but since they tend to stand close to 7 feet tall, they often weigh close to 200 pounds.

Fire archons must "breathe" in the sense that a fire needs air. Without it, they dwindle and die, suffocated by the lack of fuel. Similarly, fire archons must "eat." Periodically, they must concentrate on burning an object completely to ash. A fire archon might accomplish this by holding the item, standing over it, or even placing it within the fire archon's face and "swallowing" it. Yet like other elementals, fire archons shall never know the joy of dreams or the terror of nightmares for they do not sleep.

Psychology

The primordials created fire archons to be their soldiers, and they come into being with a soldier's mindset. From their first conscious thought, fire archons expect battle and are ready to serve in war. Fire archons seem to recognize the authority of other fiery creatures automatically and fall into ranks for them. Yet others who summon or create them must first cow them by some show of superior force. Once they know their place, fire archons serve willingly so long as their needs are met, particularly the need for conquest.

Fire archons think of everything in terms of conflict. They remain ever aware of what side they are on, their subordinates and commanders, what creatures are current foes, and which enemies are ones they must face in some later fight. This extreme perspective might make them appear brutish, but they possess astonishing cunning and a general's grasp of tactics. Underestimating a fire archon is a sure way to see it gain the upper hand.

Just as a fire archon must breathe and eat, so must they conquer and destroy. Such activity nourishes and energizes them. Without it, they grow restless at first and then careless and sluggish. This need for new ventures keeps fire archons on the move and on the offensive. Defeats, the need to build and train forces, and planning can cause them to stop for long periods, but unless a foe can destroy them utterly, it's often best to attempt to redirect their fury toward easier targets.

Society

Left to their own devices, fire archons adopt a society based on a rough military structure. Physical and strategic contests, usually not lethal, are used to determine rank. Fire archons are quick to acknowledge superior power and intellect in another fire creature, so competitions tend to be few and brief unless there are several contestants of very similar power. Despite their warlike natures, fire archons aren't inclined toward fractiousness and infighting. Fire archons on the opposite sides of a conflict will happily slaughter one another, but within a force, fire archons prefer to focus their aggression outward.

The number of "ranks" in a fire archon society depends upon how many fire archons there are. A leader has five followers, who each in turn have five followers. This structure flows downward to the lowest rank. Each member in a group of five takes its orders from any of the members of a group of five individuals of the next highest rank. Uneven numbers of groups are placed in the lowest rank. Any odd number in a rank filters in as extra members of one of the other groups rather than forming a group of less than five. Similarly, attrition results in eventual redistribution into groups of five. Thus a hundred fire archons would typically have one leader, five subcommanders, twenty-five captains, and sixty-nine members in its lowest rank.

Scholars can't be certain of the significance of the number five, and fire archons themselves simply see it as "natural" and "efficient." In numbers less than five, fire archons see themselves as individuals rather than brethren, and they become less efficient and less willing to work as a team. Those who seek to subjugate fire archons should keep this in mind. Similarly, the rank structure of fire archons doesn't allow an outsider to elevate a favored archon above its personal merits. Doing so can result in the archons flouting commands while they follow the old structure, or the favored member might be ostracized from the ranks, resulting in a reorganization and poor cooperation with the favored member. Material goods, particularly weapons and armor that can make a favored archon more powerful, presents a much better way to reward service.

All fire archon societies inevitably strike outward, and the leader determines the direction and target. When they do, the archons seek to lay waste to nearly everything they encounter. Archons tend to avoid building or creating anything, but they will make fortifications when fighting a long-term conflict or to protect a valuable resource, such as a fire font and foundry. Fire archons prefer not to do such work themselves, and when possible, they enslave conquered people and use them for forced labor. Such slaves face a bleak existence held by captors that have no empathy and no use for them once the job is done. Slaves with an interest in their future therefore find ways to remain useful, playing upon the fire archon's sense of superiority and concern about foes.

Many fire archons owe their existence to the efreeti, and these archons seek to emulate their creators, even long after being freed from their control. They are far more inclined to take and keep slaves, build structures, and

secure territory. They often attempt to create an environment similar to that which surrounds the City of Brass -- a task aided by the effect the presence of fire archons can have on the environment.

When fire archons gather in numbers, they set fire to things and their bodies produce heat, but these factors cannot explain the drought that presages the army's march or the eruption of long-dormant volcanoes. It seems that simply having fire archons in an area creates a sympathetic link to the qualities of heat and flame. Created by elemental flame and composed of it, fire archons seem to form a peculiar gateway for the power of fire in the Elemental Chaos. It's said that within a mile of even a single fire archon, a candle flame burns an inch higher and a single spark can kindle a coal.

Creating a Fire Archon

Fire archons cannot reproduce by any typical means. Instead, they are created from another elemental's body and spirit. To accomplish this, a ritual must be performed in a magic foundry infused with elemental fire. The nature of the elemental summoned by the ritual is not important. It might be a dumb earth beast or a highly intelligent elemental with ties to water. The ritual taps into the creative and recreative power of the primordials, wholly transforming that creature's form and soul. Needless to say, most consider the creation of a fire archon a wholly evil act.

A foundry must be constructed upon a powerful font of elemental fire. That kind of upwelling of fiery energy can be found in the Elemental Chaos as rivers of fire hurtling through space, lakes of molten air flickering in glowing caverns, or great crystals brilliant with internal infernos. Fire fonts can be found on other planes as well. They are most common in places such as volcanoes or tunnels where magma flows, but fire fonts aren't beholden to other sources of heat. A fire font might act as a gateway to the Elemental Chaos or from it to another plane. Or a fire font can be a concentration of elemental energy native to the plane on which it is found. One might be a holdover from the days of creation, a seam in the plane that was never sown shut. Another might be a weakness in danger of widening or perhaps a vent to let power escape so that it is does not build. In all cases, fire fonts are miraculous places of fantastic appearance.

Fire archon foundries vary in appearance, but all have two elements in common: a summoning crucible and a forge. The summoning crucible serves as the transformation space for the summoned elemental creature. It must be large enough to hold the elemental and have the power of the fire font coursing through it. The summoning crucible must have elements designed to focus the fire energy and use it as a binding force. Held in place and infused with this energy, the summoned creature can then be destroyed and reincarnated by the ritual. It must then be encased in armor from the forge.

Although a fire archon can remove its armor and wear different armor during its life, the encasement of its energies in armor from the foundry's forge is a crucial element of the ritual. Without that final step, the fire archon might expire or lack the intelligence and soldier's mindset at best, and at worst, it might grow into something powerful and uncontrollable that seeks revenge for its torturous transformation.

The forge itself rarely appears like a common forge. Using the fire font as a source of heat and flame and elemental energies as hammers and forms, the forge can be an unrecognizable contraption of magic and arcane elements.

A working foundry can produce fire archons as often as the ritual can be performed and for as long as the foundry's resources are maintained. The power of the fire font the foundry is built upon determines the type of fire archon created. As the fire energy fluctuates in strength, so too do the results of the ritual. A fire font at ebb generates basic fire archons, while at high flow it produces the more powerful fire archons, such as blazesteels or ash disciples. Creatures without fiery souls should beware creating fire archons beyond their ability to quell.

Fire Archon Weapons and Armor

The fury of a fire archon's form is contained by its armor, and its first suit of armor is integral to its being inasmuch as a human or elf must have skin and bones. After time however, a fire archon can change its original armor for new should it choose to do so. Many never see the need, but fire archons that evolve or gain levels often perceive the value of a different armor strategy.

Fire archons choose a new armor for the armor's capabilities or they may pick a piece to replace a sundered piece. Armor generally takes the form of a breastplate and pauldrons, but other elements such as bracers, girdles, vambraces, and helms are not uncommon. Breastplate, full plate, chain mail, and chain shirts are most common. Nonmagic organic materials such as leather are destroyed over time because a fire archon unconsciously burns the material when it eats.

Fire archons craft weapons and armor of amazing quality and stunning appearance. Using instinctual knowledge of metallurgy, fire archons craft only items of masterwork quality. Their work is on par with that of dwarves, but of course, the two are easy to tell apart. A flame motif decorates nearly everything a fire archon crafts, and its work looks seamless because it is.

Fire archons can use many different weapons, but they prefer those that remind them of the flickering tongues of

Fire Fonts as Adventure Locations

A fire font presents a great opportunity for a cool adventure location. Let your imagination run wild. Put it anywhere you like, and use it as an excuse to make a truly magical location. Flame throwers in the walls and floor, flying bonfires, jets of fire that leap from place to place, buildings of flickering crystal, inferno tornadoes that carry creatures about, stairs of smoke, blazes that act as teleport pads -- whatever you want.

The location might be a landmark in your campaign known half the world around for its miraculous powers. Or maybe it's a hidden resource jealously guarded beneath the ziggurat of some mortal ruler. It could be an ancient and lost mystery like the Fountain of Youth or it might have thrust itself up from the earth with cataclysmic suddenness.

Of course, it doesn't have to be all about fire damage. Some of the fires might not harm anything and instead act more like *continual flame* spells. Other fires might deal another type of damage, such as cold or acid. Use color to indicate what the fires do, but allow the players to experiment and learn. A blue flame might be cold and a black one negative energy. An upside-down fire might indicate a teleporter, while a fire that doesn't flicker might be solid as a rock.

A fire font gives you a dramatic backdrop and an

fire. Thus they avoid heavy or bludgeoning weapons, and enjoy scimitars, falchions, and even lighter weapons such as rapiers. Metal weapons are a must, since most fire archons can transfer the heat of their bodies through weapons to burn foes -- an impractical attack if the medium for that transference turns to ash.

excuse to plan some very dynamic encounters. Use the environment like monster in the fight. Allow it to become a character in the story of the adventure. You won't regret it.

Behind the Scenes: Monster Evolution

The fire archon derives its origin from two places: the desire for more interesting elemental monsters and **Dreamblade**. When we sat down to discuss which creatures would carry forward to the new edition, what would be in the first *Monster Manual*, and what would inhabit the various planes in the new cosmology, the need for more interesting elemental foes came up again and again. This problem first reared its head in the bland nature and conflicting natures of elementals of 3rd Edition.

Out with the Old

The elementals of 3rd Edition have no needs, no clear desires or motivations, and no culture, yet they attain human Intelligence, speak, and can manipulate objects. They exist in limitless numbers on the elemental planes, but they build nothing and make no lasting impression upon the game. Mechanically, they exist as neat creatures to summon or put in a dungeon and nothing more. What do they do on the elemental planes besides attack interlopers? What do they care about? In 3rd Edition, we have only vague ideas that they fight each other. If they were dumb beasts, they would make more sense. If they had a culture and did interesting things like invade the Material Plane, they would be better. But the elementals of 3rd Edition don't do either. Most creatures of the elemental type follow suit, and you have to look at outsiders such as salamanders and genies for interesting creatures with elemental themes.

Add to this the fact that the elementals' mechanics are either boring or complex. Most of them simply walk up to a PC and hit the character with a fist. Fire elementals at least do fire damage, but it hardly screams cool to face an elemental and have it act like an ogre without Power Attack. It doesn't even whisper it. The flip side of this includes mechanics such as the air elemental's whirlwind. Any mechanic that makes a person look up weather conditions in the *Dungeon Master's Guide* is just begging to be "forgotten" by the DM.

We tried to rectify this in the late stages of 3rd Edition. You can see various attempts in *Monster Manuals III, IV, and V*, the most successful probably being the avatars of elemental evil of *Monster Manual IV*. Yet such inventions were a band-aid on a scar over thirty years old. The new edition offered a chance to shuffle thing up a bit, give elementals a new hand, and deal in some new players.

In With the New

Of course, elementals -- those beings of the four elements that exist so people can summon them and put them in dungeons -- still exist in 4th Edition. We've given them a new story and some clean but cool mechanics, but this article isn't about them. It's about how else we filled the void for interesting elementally based creatures. The upcoming edition uses an altered list of creature types and uses type quite differently when it comes to mechanics. Thus creatures that seemed like they should be elementals (efreeti, salamanders, and so on) bear that type now. Yet even after reshuffling things, the game still cried out for more elemental baddies.

That's where **Dreamblade** comes in. The Flame Harrower caught the eye of several folks in R&D when it came out, and Bill Slavicsek mentioned that he wanted something like that in 4th Edition. On a purely aesthetic level, the combination of a largely transparent miniature with some metallic parts is pleasing to the eye. It's like looking at jewelry or candy. However, we all agreed that the "metal underpants" were not a positive feature. To fix that, we decided that the future monster would have a lower body of solid elemental material.

So we had a hole to fill and a visual cool concept to fill it. All that remained were the name, flavor, and mechanics. The mechanics evolved over time. In fact, as I write this, we are playtesting, and I can't be sure that the current 4th Edition mechanics will remain. The flavor evolved somewhat, but we knew that we wanted them to see a lot of use, so we always planned on them being a somewhat mercenary force. The name was an easy choice, if a bit controversial to some.

Early on in the process of designing 4th Edition, we had many discussions of the elements of 3rd Edition that we could carry forward. We took a long look at which cows really were sacred and which would make fine rump roast. The animal-headed archons weren't high on anyone's list. They exist to fill out an alignment wheel of outsiders -- a dubious purpose -- and they're an inherently strange concept. In **D&D's** universe, why do some angelic beings have horse heads? What population besides werebears and normal bears do bear angels serve? Add to their innate weirdness the fact that alignment and the planes work differently in 4th Edition, and there simply wasn't reason enough to preserve them.

Yet the word "archon" is powerful, and we knew we wanted 4th Edition to use it in a cooler way that would be more likely to see play than the angelic furries. Giving it to the new elemental beings we wanted in the game seemed a perfect fit. There could be no confusing them with the old archons, and using a cool word that would be familiar to many players would raise their profile.

Sample Fire Archons

The following statistics present three fire archons using 3rd Edition rules. The first fire archon has statistics similar to the Fire Archon miniature from the *Desert of Desolation* set. The second and third fire archons use 3rd Edition mechanics to mimic the fire archon's 4th Edition rules.

Fire Archon CR 6

hp 68 (8 HD); death throes

Often CE Medium elemental (extraplanar, fire)

Init +7; **Senses** darkvision 60 ft.; Listen +8, Spot +9

Languages Common, Ignan

AC 18, touch 13, flat-footed 15

(+3 Dex, +5 armor)

Immune critical hits, fire, flanking, paralysis, poison, sleep, stunning

Fort +6, **Ref** +13, **Will** +7

Weakness vulnerability to cold

Speed 30 ft. in breastplate (6 squares), base speed 40 ft. *{{see skill points below; original text just said 30 ft. (6 squares)}}*

Melee mwk scimitar +14/+9 (1d6+6 plus 1d6 fire/18-20) or

mwk scimitar +10/+5 (1d6+6 plus 1d6 fire/18-20) and

mwk scimitar +10 (1d6+3 plus 1d6 fire/18-20)

Base Atk +6; **Grp** +12

Special Actions death throes, fire burst

Abilities Str 23, Dex 24, Con 19, Int 13, Wis 16, Cha 16

SQ darkvision 60 ft., immunities, vulnerability to cold

Feats Iron Will, Two-Weapon Fighting, Weapon Focus (scimitar)

Skills Intimidate +14, Jump +14, Listen +8, Spot +9 *{{numbers I come up with if speed is base 30 ft (20 ft. with armor): 14/8/8/9; if speed is base 40 ft (30 ft. with armor), then these numbers work; I'm making the assumption that the base speed is 40 feet above based on the stats here.}}*

Possessions 2 masterwork scimitars, masterwork breastplate

Fire Burst (Su) Three times per day as a standard action, a fire archon can unleash a 10-foot radius burst of fire centered on itself. The fire causes 3d8 points of fire damage to creatures in the area (Reflex DC 18 for half).

Death Throes (Su) When a fire archon is reduced to 0 hit points, it explodes. Treat this effect as a fire burst attack that causes 5d8 points of damage.

Vulnerability to Cold (Ex) A fire archon takes half again as much (+50%) damage as normal from cold attacks.

Fire Archon Blazesteel CR 7

hp 105 (10 HD); wounded burst

Often CE Medium elemental (extraplanar, fire)

Init +8; **Senses** darkvision 60 ft.; Listen +12, Spot +12

Languages Common, Ignan, Terran

AC 20, touch 14, flat-footed 16

(+4 Dex, +4 armor, +2 shield)

Immune critical hits, fire, flanking, paralysis, poison, sleep, stunning

Fort +9, **Ref** +11, **Will** +8

Weakness vulnerability to cold

Speed 40 ft. (8 squares)

Melee mwk scimitar +16/+11 (1d6+7 plus 1d6 fire/18-20)

Base Atk +7; **Grp** +14

Combat Options flanking fire

Special Actions wounded burst

Abilities Str 25, Dex 19, Con 22, Int 14, Wis 16, Cha 15

SQ darkvision 60 ft., immunities, vulnerability to cold

Feats Combat Reflexes, Improved Initiative, Iron Will, Weapon Focus (scimitar)

Skills Balance +5, Intimidate +15, Jump +21, Listen +12, Spot +12, Tumble +15

Possessions masterwork scimitar, masterwork chain shirt, masterwork heavy steel shield

Wounded Burst (Su) If a fire archon blazesteel is reduced to half its hit points or reduced to 0 hit points, it unleashes a 10-foot radius burst of fire centered on itself. The fire causes 5d8 points of fire damage to creatures in the area (Reflex DC 21 for half).

Flanking Fire (Ex) When a fire archon blazesteel flanks a foe, it may make an extra basic attack against that foe whenever it attacks. In addition, the fire archon blazesteel's attacks against the flanked foe cause +1d6 points of fire damage for every other fire archon adjacent to the flanked target.

Vulnerability to Cold (Ex) A fire archon takes half again as much (+50%) damage as normal from cold attacks.

Fire Archon Ash Disciple CR 8

hp 119 (14 HD); death throes

Often CE Medium elemental (extraplanar, fire)

Init +10; **Senses** darkvision 60 ft.; Listen +12, Spot +12

Languages Common, Ignan, Terran

AC 21, touch 16, flat-footed 15

(+6 Dex, +5 armor)

Immune critical hits, fire, flanking, paralysis, poison, sleep, stunning

Fort +8, **Ref** +15, **Will** +9

Weakness vulnerability to cold

Speed 40 ft. (8 squares); flame step

Melee slam +16 (1d6+5 plus 1d6 fire and target catches fire)

Ranged fire bolt +16 (50-ft. range; 8d6+5 fire and foe catches fire; creatures adjacent to target take 1d6 fire)

Base Atk +10; **Grp** +15

Atk Options Point Blank Shot, Precise Shot

Special Actions cinder burst, death throes, flame step, flame wave

Abilities Str 21, Dex 23, Con 19, Int 15, Wis 16, Cha 17

SQ darkvision 60 ft., flame step, immunities, vulnerability to cold

Feats Improved Initiative, Iron Will, Point Blank Shot, Precise Shot, Weapon Focus (slam)

Skills Balance +8, Intimidate +18, Jump +26, Knowledge (the planes) +7, Listen +12, Spot +12, Survival +3 (+5 on other planes), Tumble +23

Possessions +1 *mithral shirt*

Cinder Burst (Su) Once per encounter as a standard action, a fire archon ash disciple can unleash a 10-foot radius burst of fire centered on itself. The fire causes 8d8 points of fire damage to creatures in the area and blinds them for 1 round (Reflex DC 21 for half and to avoid blindness).

Death Throes (Su) When a fire archon ash disciple is reduced to 0 hit points, it explodes. Treat this effect as a cinder burst attack that causes 10d8 points of damage.

Flame Step (Su) As a move action, a fire archon ash disciple can teleport to within 15 feet of any fire creature within 100 feet.

Flame Wave (Su) Once per encounter, a fire archon can unleash a wave of flames in a 30-ft. cone. Creatures in the area take 8d8 points of fire damage (Reflex DC 21 for half) and are pushed back two squares (no save).

Vulnerability to Cold (Ex) A fire archon takes half again as much (+50%) damage as normal from cold attacks.

About the Author

Matthew Sernett has been a designer of 4th Edition, the Editor-in-chief of *Dragon* Magazine, a pizza cook, an onion packer, and an assembly line worker in a spring factory. In 1999, while working for *Men's Health* Magazine, he narrowly avoided being a wardrobe tracker in the male fashion industry. He feels very fortunate to now be employed as a creative designer for Gleemax.

THE ECOLOGIES OF THE FIRENEWT & GIANT STRIDER

Hammer & Anvil

Of those who
encounter the
deadly firenewts
and their terrible
steeds, it is
written that
they shall die.

ARE YOU SURE YOU FEEL UP TO THIS, MUFTI? Grandfather will wait if you need more time to rest."

"I can manage, Letifa. I must," he grunted. With a lurch, Mufti got to his feet. His face, arms, chest, and feet were still wrapped in concealing gauze. The bandages covered the cooling salves that worked on his tortured, blistered skin. His long black hair was uncovered, as were his brown eyes. There were two holes in the gauze over his face: one for breathing, one for drinking. But he could stand and walk. Most importantly, he could speak. He had to speak. Mufti grimaced through the pain as Letifa dressed him in a black aba.

The glare of the merciless sun staggered Mufti as he and Letifa emerged from the tent. He clutched at her arm to steady himself. How long had he endured the sun's searing heat without burnoose or sandals? Men, women, and children squinted at the pair as they slowly walked toward the large tent at the center of the oasis. Many of the people whispered, and he could imagine what they were saying. How it was written that Mufti should have died, yet he had not. How no one had survived alone in the desert known as the Genie's Anvil without camel or water. Off to one side, the tribe's goats bleated anxiously, as if agreeing with their nomadic owners.

Mufti and Letifa entered the tent and immediately went to their knees, making obeisance to their leader, Mustafa al-Kor, Preserver of Knowledge, Enemy of the Ignorant, Protector of the Bedine, and

Grandfather of the Wrath of the Old. With a gesture, he signaled them to rise. He sat amid a pile of fringed and tasseled pillows, puffing on his hookah. Today he was dressed in his black robes and turban. Mustafa's long mustache and beard were white. His face was wrinkled from the sun and his long years. He smiled wryly, showing that his teeth were still strong and white.

"Mufti, once again you have cheated death. This time it was rather close, no?"

"Grandfather, I must tell you ..."

"All in good time, Mufti. Letifa will take notes of your account as you speak, and I am anxious to hear it. It seems you have more lives than the Loregiver's cat, and you must start from the beginning. But first, have some juice. According to our healers, it is the best thing to drink after such an ordeal. And I expect you will share salt with me?"

by
Paul F. Culotta

illustrated by
Terry Dykstra

Mufti took the proffered cup and drank deeply. Faint, dim memories returned. Plodding through an endless, white-hot hell, water gone. Falling, cursing the gods. Baking. Blackness. Excited voices. Water splashing on his face and body, then pouring down his throat. Finally awakening in the dark tent to Letifa's soothing voice, gently urging him to drink more. Screaming as the healers applied their ointments and bandages to his burnt skin. He slept.

Mufti gathered a pinch of salt from the nearby bowl and tasted it. He winced as it dissolved and seeped into his cracked lips. He quickly drank more of the juice and waited for the pain to subside. Meanwhile, Letifa went to a nearby chest and pulled out paper, pen, and ink.

"To begin with, grandfather, you recall that you assigned me to join the expedition to find the lost tomb of Anak-Raya. I did so, hiring on as the caravan barber."

"An excellent disguise. The training you had for the mission in Huzuz has had many uses," said Mustafa.

"Yes, grandfather. After many adventures, we finally reached the High Desert and ..."

"Oh no, Mufti. I want to hear it all! What adventures?"

Mufti sighed impatiently. "Grandfather, I beg your indulgence. I know how you love a good story, but just hours from here is a lair of evil creatures that could attack and kill us all. Please let me tell this part to you first."

Mustafa frowned and puffed furiously on the hookah, causing clouds of smoke to billow around his head. He shouted, "Hassan!"

A tall, muscular man quickly came into the tent and knelt. "Yes, grandfather."

"Double the guard immediately! And the patrols as well!"

"As you wish, grandfather." Hassan scowled briefly at Mufti as he bowed his way out.

"Very well, Mufti, continue."

"Thank you, grandfather. As I was saying, we entered the High Desert and, after days of searching, found the tomb. Several of the workers died from hideous traps that Anak-Raya had left for looters, but in the end we found the Scrolls of Destiny. As you suspected, they were large rolls of papyrus in gold cylinders."

"And no doubt Sadam al-Tajar was incensed when you approached him and made him our offer to, ah, relieve him of the Scrolls?" Mustafa grinned.

"Frankly, grandfather, I was waiting until we were closer to this oasis where I was to meet you with the scrolls. But I never got the chance to make the offer. Two days after leaving the tomb, we were attacked by creatures I had never seen before. As you know, Sadam had

hired many guards, many of them fearless desert riders rarely surprised by enemies. But as we traveled through a sandy gorge, several heavily armed monsters wielding pikes and swords burst out of the sands on our right flank.¹ They were dark brown, lizardlike beings that stood and fought upright like men. Worse yet, they breathed fire on the camels and stabbed them with spears, which greatly panicked the beasts and put the entire caravan in an uproar."²

"Mufti, excuse me. My report must be complete. What time of day was this? And how large were these creatures?" asked Letifa, who was scribbling furiously.

"It was about two hours after sunrise. The creatures were a little taller than me, or about as tall as Hassan."³

"Thank you. Please continue."

"Grandfather, the fight was terrible.

1. Firenewts are generally encountered in volcanic regions, but they may be found in any area of extremely hot temperatures, such as a desert. Their coloration varies from dark brown to a grayish brown that becomes white around the belly, although the belly is no softer than the rest of the creature, and they can easily bury themselves in sand and remain hidden with only their noses and eyes (which look like rocks) sticking out. Most PCs have only a 5% chance of noticing anything strange

when walking into a firenewt ambush. Rangers and PCs with the Survival (Desert) proficiency have a 10% chance, while Desert Riders have a 15% chance. PCs with the Alertness NWP gain a 5% bonus.

2. Attacking mounts first is a favorite firenewt tactic. As carnivores, they appreciate the large amount of meat that a horse, camel, or elephant provides. Moreover, killing the mounts ensures that no one can ride away. If the victims of the firenewts' attack prevail in battle (or escape), then they are without

mounts, which means that they face a long walk home and probably won't survive. Firenewts focus their attacks on mounts for the first 3 rounds of combat or until at least half the mounts are down before turning to the riders.

3. Firenewts can not abide the coldness of the desert night and do not set ambushes until at least an hour after sunrise. This is yet another good reason for traveling the desert only at night and stopping promptly when the sun comes up.

Figure 1

The ambushers await their victims.

Figure 2

As the first attackers burst from the sands, reinforcements await their command.

At that point, I dropped my disguise as the caravan barber and fought with the others. I found myself pitted against a creature clad in chain armor ..."

"In this heat?" Mustafa exclaimed incredulously.

"Yes, and it fought like a mamluke, the way it wielded that battleax.⁴ Had it not been for my training, I most likely would have died. As it turned out, after a few moments of dodging the creature's heavy blade, I finally drove my dagger into the creature's eye. With a final gasp, it shot fire on my robe."

"I heard about the burns on your chest, Mufti. From what the healers tell me, the scars will be permanent. I am sorry for this, but please continue. Did you escape and make your way here?"

Mufti snorted and then grimaced in pain.

"I wish that I had. Men and camels were dying everywhere, but Waleed, our guard commander, had rallied us. Just as we were fighting the creatures to a standstill, we heard high-pitched horns and a muted drumming behind us. I turned. Thundering down on us were at least forty giant two-footed lizards, each as large as a camel and bearing a lizard-beastman with a lowered pike.⁵ As they charged at us, the giant lizards made a terrible screeching noise, and several of the guards fled, only to be speared in the back or trampled into the dust.⁶

4. While there is one elite Warrior (3+3 HD, AC 3) for every ten firenewts, there is a 30% chance that this Warrior has weapon specialization (+1 to attack rolls, +2 to damage rolls, 3/2 attacks, 420 XP).

5. Giant striders are not lizards, but large, flightless birds. Although firenewts primarily use the giant striders as mounts, when one outlives its usefulness (usually no longer than fifteen years) it is slaughtered for food, and its inedible parts scavenged to make other products. Firenewts fashion saddles from the creatures' tough leathery skins, saddle bindings from tendons and ligaments, and signal horns from bones. Nothing goes to waste in firenewt culture.

6. The second feature of the classic firenewt ambush occurs when the victims are totally engaged in battle with the first group of firenewts that emerged from the sands. At this point, the leader of the dismounted firenewts signals with a polished stone, metal shield, or horn to a concealed band of firenewts mounted on giant striders. At the signal, this group charges from its concealed position and lays into the defenders' rear, causing maximum shock and panic. Just before impact, the giant striders are trained to bellow ferociously, and their terrible cries cause all NPC defenders to make a morale check. The firenewts call this ambush the "hammer and anvil," with the firenewts on foot being the anvil, and those charging on striders being the hammer. The result, combined with the defenders' loss of mounts, is usually a bloody rout. Figures 1-4 graphically depict the hammer and anvil strategy.

"Jaheira, the flame sorceress who had accompanied us, cast a ball of fire at this group, which heartened me greatly. Alas, her magic did little. The blast knocked some of the riders off their mounts, but the big lizards kept coming as if nothing would stop them. Indeed, when they came close, balls of fire blew out of their eyes as they all converged on Jaheira. I was knocked flat by the explosions, and when I looked up, there was nothing left of her except one charred slipper. It was then that something hit me in the head and all went black."

In a mass charge, mounted firenewts use long pikes that inflict double damage. The normal bonus and penalty for a charge apply. A victim struck by the pikes must make a Strength check (-5 penalty) or be knocked to the ground and trampled by the giant strider for an additional 1d10 points of damage. If the firenewt rider misses with his pike, the giant strider gains a separate attack roll with the same mechanic (-5 penalty to Strength check; 1d10 points of trample damage if knocked down).

If one must travel in the desert during the day, the best way to avoid the hammer and anvil is for the caravan to have someone with flying magic reconnoiter ahead and spot the "hammer" element. Those who do not have such means are strongly advised to have a screen of riders posted ahead and to the flanks of the caravan. In game terms, aerial reconnaissance has a 65% chance of spotting the "hammer" while screening riders have only a 40% chance (+5% for each rider who is a Ranger, has the Desert Rider kit from *Arabian Adventures*, or who has the Desert Survival non-weapon proficiency).

A variation of the hammer and anvil tactic occurs in volcanic regions. Firenewts call this tactic the fire box. In this case, a few firenewts mounted on striders slowly flee in plain sight from armed opponents. They lead their pursuers to an area where the opponents are channeled by a cliff on one side and a pool of lava on the other. At the end of this passage are three ranks of dismounted firenewts with bristling pikes firmly set to receive any charge. Behind the firenewts is a Priest who first casts *pyrotechnics* (smoke effect), causing the channel to become obscured and possibly causing wayward opponents to plunge into the lava. A blown horn signals a unit of mounted firenewts to fall upon the rear of the pursuers. As the opponents are trapped by dismounted firenewts, a cliff, lava, and mounted firenewts, the Priest casts a unique firenewt spell, *lava splash*, which causes lava to splash onto the opponents and their mounts. Firenewt Priests may cast this spell three times a day. The details of this spell are in the sidebar.

7. As the *MONSTROUS MANUAL*™ book points out, giant striders are immune to magical fire; indeed, intense heat, such as that produced by a *fireball*, acts as a *cure light wounds* spell on a giant strider. Lesser fire effects (*burning hands*, Greek fire, etc.) cure 1-6 hit points of damage. Because giant striders receive healing benefits from fire, typically one of the first priorities after battle is for the firenewts to breathe fire on badly wounded giant striders.

Giant striders are also trained to fight even when their riders are knocked off. Furthermore, they are trained to focus their *fireballs* on any defender who attempts to use magic.

Firenewts are not immune to magical fire, but they do receive a +3 to their saving throws, and all damage is reduced by 1 point per die of damage.

While the victims fight the first attackers, reinforcements take their positions.

Finally, the reinforcements attack from the rear.

"Somehow you awoke and wandered here? Surely Fate was kind to you."

"Oh, how I wish that were the case, grandfather. When I awoke, I found myself in a dark cavern, chained to the wall, along with dozens of my comrades. The chamber was intensely hot, made so by a mound of glowing, heated rock off to one side.⁸

"We lingered there for days. Each day, several of the creatures would come. One wore a beaten metal breastplate with a design of a bonfire on the chest, and it was he who would examine us, give us a little food or water, then poke at us with his heavy mace. Finally, he would hiss something and point at one of the prisoners. The others then fell upon the

designated prisoner and dragged him off to a neighboring chamber where we heard his screams for hours. We would never see him again. Grandfather, I have known fear before on many occasions, but never have I been so terrified as when those creatures would appear each day to make their selection."⁹

"So how did you escape such a place?" asked Mustafa.

"One day I awoke and noticed that one of the chain links was weak and thin. I twisted the chain several times until the link snapped cleanly. From there, I was able to pick the lock on the other manacle and free myself."

"May the Old One be praised!" exclaimed Letifa softly.

"Two of those few comrades who remained were dead. The rest were so weak they could not even stand. I had to leave them." Mufti spoke carefully. He would not shame his order by breaking down.

Mustafa put down the tube from his hookah and came over to Mufti, putting his arms around him and patting him gently on the back. "You did what was necessary, grandson. Think on it no more. It was their fate to die," he said.

Mustafa poured Mufti another cup of juice and gently urged him to continue.

"I went through their caverns, keeping to the shadows, close to the walls as I have been taught, trying desperately to find a way out. There were numerous chambers filled with the beastmen, their lizard mounts, and more of the ones with the metal breastplates."

"What of the place where you heard the screams?" interrupted Mustafa.

Mufti looked at the ground and shook his head. "Please, grandfather, I do not wish to talk about it. Maybe later, but not now."

"Well, yes, later is good," he replied. "But can you tell us how many of these creatures there were and whether they took the scrolls?"

Mufti shook his head. "No, I cannot say exactly how many there were because I did not explore all the caverns. I only wanted to get out. From what I saw, there were at least two hundred, and about half that many of the giant lizards."

"That many!"

"Yes, not all of them were as large as the warriors, and I assume these were females. They were colored differently too, a dull brown. As to the scrolls, yes, they took them, but I could not get them."

"Why not?"

"One of the chambers I passed had

8. Giant striders become sluggish in cold temperatures found in such places as the desert night or underground. Their droppings, however, retain heat for up to ten hours in confined areas and keep any cavern lair toasty. Oddly, the droppings have no odor. They look like piles of oozy rock, and anyone unfortunate enough to step in a pile suffers 1-6 points of heat damage. Fortunately, they are easily detectable, as they glow with as much light as a torch.

9. Although a tribe of firenewts is ruled by an overlord, the day-to-day activity is run by the

priesthood. Firenewt Priests worship Kossuth, the tyrant-king of fire elementals, and receive their spells from that entity. It is the Priests who designate which captive human or humanoid becomes the daily meal (after a grueling torture routine) since such prisoners are considered delicacies. Humanoid prisoners (dwarves, gnomes, elves, orcs, etc.) are always the first to be selected. The Priests typically keep the juiciest tidbits for themselves and dole out the rest to the Warriors. Offal (entrails, organs, brains, etc.) is given to the giant striders.

Occasionally Priests, elite Warriors, and overlords may (50% chance) speak Common, but they usually do not choose to do so, since to them, it is just speaking to "food."

Water is an ingested poison to firenewts and giant striders (victims must make a successful saving throw vs. poison or die; a successful save results in 1d12 points of damage) and is thus a commodity closely regulated by the firenewt priesthood. Not only is it used to sustain prisoners (firenewts like "fresh" meat), but the Priests use it to kill rivals and to give aged giant striders a "merciful" death.

three beastmen, who bowed and hissed strange noises before an idol of pure gold. Their idol was fashioned in the form of a pillar of fire, the same design as on their breastplates.¹⁰ Behind it were the scrolls and several other possessions taken from the caravan, including my daggers. There were three of these creatures and I had no weapons."

"I see," murmured Mustafa disappointedly.

"But in the same chamber was a small stream of water with several bottles nearby. Fortunately it was close to the entry, and I was able to steal one of the bottles and fill it without discovery. That was the only water I saw in the entire place. A little while later, I found the way out."

Grandfather leaned forward, a gleam in his eye. "It was lightly guarded?"

"Two guards, both now dead," replied Mufti. "I crept up to them, snatched a sword from one's scabbard, and killed it quickly. The other took just a few moments more."

"You had no sword when we found you."

"No, after hours in the heat, I left it. As I left the water jug when it was empty."

"Ah, yes. I remember," replied Grandfather. "It was fortunate that the patrol found you. Many have whispered that your coming here bodes ill, for it was written that you should die."

"Fate is fickle, grandfather, but apparently it was not written, because I am here alive and well, thanks be to the Old One."

"How did you find your way here?"

"In the distance, grandfather, I saw the peak known as the Turban. Between it and the location of the sun, I determined the general direction I had to travel to reach you."

"Mufti, were there any other chambers in the lair that seemed unusual?" asked Letifa.

"Just one. One large cavern had a number of huge eggs lying in holes in the ground. There must have been at least fifty of them, each surrounded by piles of glowing rock. Several of the two-legged lizards kept watch in that place. The heat of the chamber was oppressive, and I dared not go in."

"A strange thing occurred after I left, though. I remember hearing what sounded like an explosion coming from that direction. I feared that perhaps it was an alarm of some sort, and I found a large crack to hide in for a while, but nothing came by. What this had to do with the eggs and the lizards I cannot say."¹¹

Mustafa leaned back into his pillows and puffed thoughtfully. One of his eyebrows arched up, and he asked, "Mufti, do you think you could find this place again?"

Mufti paused, thought a few moments, and then answered, "Grandfather, your will is mine. I can try to lead you there, but even if the entire Wrath of the Old were assembled..."

"Oh, but it is. Every member is here."

Mufti gaped at this statement. The Wrath had hundreds of members all over Zakhara, and they had all been brought here? What was in those Scrolls of Destiny?

down on the eggs. This makes the entire chamber a constant 170 degrees. The eggs are impervious to the heat and may be used as components in making *potions of fire resistance*.

Firenewt eggs are taken to a special hatching ground guarded by one Priest, an elite Warrior servant, and two giant striders. The eggs are kept warm, just like the giant strider eggs, although less heat is required. Firenewt eggs are not used in the making of potions or other magical items. When a firenewt hatches, it tears its way out of its thick egg casing as the Priest looks on. If it fails to emerge from the egg in one turn, it is deemed too weak to remain alive, and the Priest tears it out of the egg and sacrifices it to Kossuth. This is a rare occurrence and is looked upon as a sign that Kossuth is displeased with the tribe. In actuality, the priesthood often uses this as an excuse to eliminate the bloodlines of their enemies.

New Priest Spell: *Lava Splash*

Level: 3

(Alteration)

Sphere: Elemental (Fire, Earth)

Range: 50 yards

Components: V, S, M

Duration: Instantaneous

Casting Time: 6

Area of Effect: 10' × 10' area

Saving Throw: Neg.

Lava splash is available only to firenewt Priests of Kossuth. They may cast it up to three times per day as long as they are in Kossuth's favor. These are not bonus spells, so each spell counts against the Priest's number of spells per day. *Lava splash* seems to be a minor variation of an *earthquake* spell, although it affects only lava pools and streams, not the underlying hard ground.

When the Priest casts this spell, he causes a wave of lava to rise up and shower anything within a 25' radius. Victims suffer 3–18 points of damage, although a saving throw vs. breath weapon reduces the damage by half. Victims in metal armor who fail their saving throw are treated in following rounds as if affected by a *heat metal* spell. Victims not in metal armor who fail their saving throw must make additional item saving throws for their clothing. If a character's clothing is ignited by a *lava splash*, he suffers an additional 1–6 points of damage per round for 3 rounds. The *lava splash* never harms a firenewt or giant strider. Indeed, a *lava splash* heals either creature as a *cure serious wounds* spell.

The material component for this spell is a fist size lump of volcanic rock, which is consumed in the casting. The spell may not be cast unless there is also a pool of lava within 50 yards of the caster.

10. The idol is a likeness of Kossuth, their deity. Although the Overlord doles out wealth from a communal hoard, the Priests receive the lion's share of it. Their belief is that the larger the idol of Kossuth, the greater the blessings he bestows upon them. When a sufficient amount of new gold is amassed, firenewt metalworkers melt it down along with the old idol and cast a larger one. Small tribes of firenewts have an idol worth at least 500 gp while larger tribes have idols worth up to 3,000 gp, and there is one tribe rumored to have an idol worth 10,000 gp. Obviously, the problem with looting a firenewt lair is transporting such a heavy thing back to civilization.

11. Giant strider eggs require considerable heat for incubation. Not only are they surrounded by heated droppings but also at least six giant strider hens remain with the eggs. They provide security against intruders, and they shoot a *fireball* into the chamber, one per turn, showering more heat

"Even so, grandfather, it would be a bloodbath, and our losses would be heavy. You know that my escape has been discovered by now. The creatures' lair will be well guarded."

Mustafa laughed heartily before answering. "In two hours, the sun will set. These creatures will all be inside their caves, and we can go there quickly by camel. In our camp are sorcerers who have spells of ice and water magic, something I suspect that these beastmen and their lizards will fear. In any case, I don't believe that they will expect anyone to attack them."

Mustafa finished this announcement with a wide smile, but just then the faint sounds of horns blowing in the distance

drifted in through the opening.

Letifa stopped her writing and looked up quickly. "The patrols, they have found something!" she exclaimed.

Grandfather no longer smiled; he sprang to his feet quickly. Now a faint drumming, thumping noise came through the tent, along with shouts as nomads rushed about outside.

Mufti sighed and shook his head wearily. "I have heard those horns before, grandfather. Not all of them are ours. Nor is that other noise."

"What are you saying?" demanded Mustafa.

Mufti arose, walked stiffly to a stack of weapons in one corner of the tent, and selected two fine scimitars and a ban-

doleer of daggers, each inscribed with the symbol of the Old One. He handed one of the scimitars to Mustafa al Kor, the Grandfather of Assassins.

"Grandfather, perhaps it *was* written that I should die. Will you fight at my side?"¹²

One of Paul's regular players is a bewitching young lady named Summer who often brings homemade salsa to the game. Some of the guys say that it bubbles and steams; others believe that it would break a geiger counter's needle. Paul suspects it's really Summer's special potion of polymorph other that will turn the DM into a firenewt if he isn't nice to her character.

12. Firenewts are noted for their extreme sadism. One of their favorite jokes is to trick a prisoner like Mufti into thinking he has escaped and let him sneak about through the lair until he finds his way out or is killed in the process. Sometimes the prisoner is totally unmolested and given a healthy head start before any pursuit begins. Firenewts consider it

great sport to allow the escapee to get just to the brink of rescue, at which point they swoop down and take him prisoner again.

The firenewts have no fear of the prisoner getting away because the giant striders have extremely sensitive olfactory glands that allow them to track a scent that's as much as three days old. The only real

chance a pursued prisoner has is to be caught in a sandstorm that might blow away the scent, to run into powerful allies, or to enjoy some other quirk of fate. Even so, surviving a sandstorm is no easy feat (see p. 82, *Arabian Adventures*), and if an escapee finds rescue, the pursuing firenewts are sure to either attack or go back for reinforcements.

THE ECOLOGY OF THE FLAIL SNAIL

The Price of Flailure

Never forget that
the Monster
Hunters
Association
doesn't work
for free.

by
Johnathan M. Richards

illustrated by
Brad McDavitt

DREELIX PICKED UP THE GAVEL AND HELD IT BEFORE HIM. He stared at it lovingly for a moment, then, almost ritually, banged it down on the table before him—once, twice, three times—and said the words that drew the attention of all the wizards and sages in the meeting hall.

"This meeting of the Monster Hunters Association is hereby opened," he intoned.

"It seems we have a rather heavy agenda tonight," he continued. "After Grindle briefs us on the pathetic state of our coffers, we'll have an update on the problems with Zantoullios' latest batch of healing potions, something about a few unexpected and unpleasant side effects"—here he fixed a stern look at the gangly wizard, who swallowed hard and grinned sickly—"followed by Willowquisp's report, or lack thereof, of useful flumph by-products." The elderly sage pursed his lips and looked at the ceiling, but said nothing. Dreelix continued: "Then, let's see, Old Gumphrey has a pitch for some new alchemical paraphernalia he thinks we need to purchase.

Is there anything else? If not, let's begin with—"

"Actually, there is something else," said Buntleby, raising his hand and standing up to address the head table. "I have received a request for assistance; in effect, an opportunity for a Monster Hunt presents itself."

"From who? What monster? How much?" fired off Dreelix.

"In order: the gnomes of Wishbottom, a flail snail, and the remains of the slain creature itself."

Dreelix harrumphed. "Another freebie," he scoffed.

"An opportunity to assist those requiring our help," corrected Buntleby. "Several gnomes working in the mines have already been slain. Think of it as a goodwill gesture."

"Goodwill gestures do nothing to fill our depleted coffers," grumbled Dreelix. Then, thinking aloud, he added, "I wonder if there are any magical uses to be had from a dead gnome?"

Buntleby stiffened, then said, "Perhaps you should put the question to Finklebintzer, the gnomish Mayor of Wishbottom." And turning to his side, he held his hand out to acknowledge the tiny gnome seated at his left.

Too late, Dreelix spotted the angry gnome and let out a high-pitched "Eep!" Then, standing to his unimpressive full height, he dressed down his colleague. "Buntleby! What's the meaning of this? Why'd you bring him in here without warning me? Are you trying to make the Association look bad?"

"No need; you seem to be quite capable of taking care of that yourself."

Dreelix fumed, then addressed the gnome. "Flitzenblinky, or whatever your

name is, please, allow me to explain ...” he began, and then proceeded to spout off a few words in an arcane language, wagging his fingers as he did so. A blank look fell across the gnome’s face; Dreelix shouted “Hah!” in triumph and sat back down. It wasn’t the first time a *forget* spell had saved his bacon.

Buntleby opened his mouth as if to protest, then gave a sigh of exasperation. He had expected little more from his exalted leader. He took his seat.

Dreelix waited until the blank look left the gnome’s face, then resumed his opening speech. “... and Old Gumphrey has a pitch for some new alchemical paraphernalia he thinks we need to purchase. But first, I believe we have an honored guest in our midst! Buntleby, would you be so kind as to do the honors?”

Buntleby stood, gave a mental shrug, and pressed on: “Gentlemen—and Lady Ablasta—allow me to introduce Finklebintzer of Wishbottom; Finklebintzer, I present to you our fearless and generous leader Dreelix, to whom we must make our appeals.”

“By all means!” agreed Dreelix, a wide, phony approximation of a smile on his face. “Our other business can wait; we are always happy to assist our neighboring communities! Please, tell us of this monster that has been troubling you, and we will decide how best to rid you of it.”

The little gnome stood up on his chair and, now at an appropriate height for public speaking, began his plea in a high-pitched, squeaky voice. “Fame of your illustrious organization has spread even to our little corner of the world, so we turn to you for aid. Our mine was recently invaded by a hideous, giant brute of a snail whose flailing appendages have caused the deaths of

three of our miners. Brute strength has had no effect; we cannot win past its nasty tentacles to attack its soft body, and our hammers and chisels seem useless against the creature’s hard shell when we attack from the rear.¹ We’ve tried throwing flaming brands at the beast, and, against my better judgment, even purchased a vial of poison from an unscrupulous type in an attempt to kill the thing—all to no avail.² We now turn to you in desperation, pleading for your assistance, for we fear to return to the mines that are our livelihood while the terrible creature stalks the tunnels and shafts.”

“A sad story, indeed,” agreed Dreelix, putting on his equally fake sad-face. “Have you tried magic?”

“We are a small mining village,” said Finklebintzer, “with no great wizards among us. My cousin Whigglesponker knows a few illusion spells and tried scaring off the creature with them, but these, too, had no great effect.”³

“A pity,” commiserated Dreelix, sticking out his lower lip in a pout meant to demonstrate his sensitivity to the gnome’s plight. “Well, we thank you for your time. Rest assured that we will study up on the creature to determine how best to destroy it for you. You may return to your village with the happy news that the Monster Hunters will be there in but a few short days.”

Buntleby stood again. “Willowquisp and I have taken the liberty of researching the creature; we are prepared to brief the Association on our notes, findings, and suggested strategies.” Willowquisp the Zoophile, an elderly sage fascinated by the wide variety of creatures inhabiting the planet—even (some might say especially) the goofy-looking ones—nodded to his younger friend and stood,

a book full of hastily-scribbled notes at the ready.

Dreelix’s face went taut with anger. He mentally reached for another *forget* spell to use on the gnome; finding none remaining, he gritted his teeth and forced his phony happy-face back on (a hideous rictus of muscular tweakings that pulled his mouth into a grotesque and unfamiliar semblance of a smile), making a mental note that from now on he’d have to carry more *forget* spells in his spell inventory. Or better yet, assign Grindle to guard the door and prevent unauthorized guests from entering official Association meetings. At nearly three hundred pounds, Grindle could be intimidating when he wanted to be—and his body odor was intimidating even when he wasn’t.

“All right,” Dreelix said through gritted teeth. “Let’s hear what you two have come up with.”

“Thank you,” said Buntleby, grabbing Willowquisp by the arm and leading him to the podium on Dreelix’s left before the Association president figured out a way to weasel out of the offer.

Willowquisp settled his book of notes upon the podium as Buntleby started their presentation. “The flail snail is a land-based gastropod, different from the standard garden snail in its unusual size, the magical properties of its shell, and the addition of its multiple flailing appendages.⁴ We’ll address each of these differences in turn.”

Willowquisp spoke up. “The flail snail averages about eight feet tall, the highest point being of course the crown of the shell. They are only about ten inches tall when newly-hatched,⁵ although they grow quickly, reaching full size within four years. The creatures have a life span of about twenty years.”

1. Although the creatures move at a slow speed of 3, flail snails can whip their bodies (or parts thereof) into their shells with astounding quickness. Attacks upon a flail snail’s soft body are therefore made against Armor Class –8.

2. Flail snails are immune to both fire and poison. Fire damage is negated both by the creature’s thick shell and the layer of wet, protective mucus that covers the snail’s exposed skin. As for poison, the flail snail has such a slow metabolism that any poison is negated by natural antitoxins in its blood before it has a chance to affect the creature.

3. The vision of a flail snail is limited. It has two small sensory appendages, one on each side of its head. The sensory appendages allow the creature to detect movement and differentiate between light and dark at a range of 20 feet, but that’s about it. Thus, the creatures are immune to most vision-based

illusions, although a *light* or *continual light* spell cast upon a flail snail’s sensory appendages blinds it. However, a “blind” flail snail can still detect movement, as that sense is based upon the detection of air currents more so than the use of vision. “Blind” flail snails therefore suffer only a –1 to their attack rolls and no penalty to Armor Class.

The sensory appendages also house the creature’s olfactory organs. Flail snails have a highly-developed sense of smell.

4. A flail snail has 4–6 clublike appendages growing from the front of its head, between its smaller sensory appendages. Each of these has a 10-lb. tip of hardened flesh covered with many knobby protrusions (not pointed spikes, with which the creature is often depicted in illustrations—spikes would easily rip through the creature’s soft flesh when it pulled its head into its shell). These club tentacles are in con-

stant motion, swaying slowly back and forth when the creature is calm and at increased speeds when agitated. The tentacles are the flail snail’s only means of active attack, each causing 1d8 points of damage. In addition, they can smash through a 1"-thick piece of wood—thus, most wooden shields must make a successful saving throw vs. crushing blow or be destroyed when struck by a flail snail tentacle.

5. The flail snail entry in *MONSTROUS COMPENDIUM*® 5: *GREYHAWK Adventures* (under “Snail”) erroneously states that flail snails give live birth to 1–3 young. It also refers to them as “silicon-based” gastropods and makes reference to flail snail “females” and “mothers.”

Flail snails, like most land-dwelling snails, are hermaphroditic, each creature manufacturing both eggs and sperm cells. They reproduce by exchanging packets of sperm cells with another partner through

"As for the creature's shell," added Buntleby, "it has a number of unusual properties. First of all, it is garishly colored, a swirling conglomeration of bright blues, reds, greens, and yellows—rather like someone let a few drunken leprechauns loose in a paint shop. Second, and most important, the shell is highly magical, reflecting, negating, or distorting magical spells directed at the creature. It is perhaps for this reason that your cousin's illusion spells were ineffective toward the beast," he added to Finklebintzer. The gnome raised his eyebrows and nodded.

"A study was once done on the magical properties of the flail snail's shell," supplied Willowquisp, consulting his notes. "A wizard by the name of Galligrave, some two centuries ago, intrigued by the variable nature of spell effects when centered on the creature, attached a *brooch of shielding* to his robes, scrounged up a *wand of magic missiles*, and repeatedly shot missile after missile at the snail, recording each result.

"Some of the missiles found their target, while some were reflected directly back at Galligrave. Occasionally, the *wand* discharged no missile at all, or, when it did, the magic was distorted, firing only a harmless beam of light or sending the missile darting off in a random direction.⁶ From Galligrave's recorded notes, we can gather that there

is only about a 30% chance of successfully attacking a flail snail with magic—not a very promising figure."

"Finally, there are the flailing appendages themselves, from which the creature gets its name," said Buntleby. "Each snail begins life with four to six appendages, and, much like the number of limbs on an osquip, the number of flails on a flail snail seems to have no correlation with the number of flails of either of its parents."

"All very fascinating," remarked Dreelix dryly. "How do we kill it?"

"Several methods suggest themselves," answered Buntleby. "We could simply hire some skilled men-at-arms to attack the thing. With better armor and weapons than the gnomish miners had available, and if the warriors concentrate on attacking the creature's flails,⁷ the creature could no doubt easily be dispatched."

"No good!" piped up Grindle the Coin-Counter. "Our funds are low; I would have to vote against any plan causing further expenditures."

"I agree," added Dreelix. "I'd rather not spend money when there are no doubt alternative solutions available. Plus, you know how I feel about warriors: overvalued lunkheads with more muscle than brains! Any dolt can pick up a sword and wave it around; it takes great skill and mental fortitude to master

the wizardly arts!" Dreelix ground his teeth at the thought of warriors. One particular memory came rushing forward, as it always did: being kicked out of Sir Scromblatt's School for Young Knights in Training as a lad. "'Total lack of aptitude in the warrior arts,' my foot," he mumbled to himself, scowling and waving a clenched fist in the air. "Ha! They were just jealous, the lot of them! And the same goes for those fools at Master Micklebie's Junior Warriors—'new levels of ineptitude,' was it? Well, who's laughing now, huh? Who's laughing now?"

There was silence in the meeting hall as the Monster Hunters looked on in embarrassed silence. With a start, Dreelix realized that he'd been speaking aloud.

"Very well then," said Willowquisp, breaking the awkward silence as if nothing had happened. "Another approach: flail snails must keep their soft bodies moist. During hot, dry weather, they undergo a hibernation-like process called estivation, where they seal themselves into their shells with a plug of hardened mucus⁸, leaving only a small air hole. While sealed up, they slow down their body processes, and can survive for months without food or water."⁹

"How does this help us?" asked Dreelix.

"What exactly do flail snails eat, anyway?" asked Spontayne at the same time.

the genital pore, a small opening near the creature's head. After mating is complete, each snail goes its own way, and the two might never meet again. After about one month, each lays a dozen or so eggs under rocks or in small crevices. Of these, usually 1-3 hatch into baby flail snails.

The young gastropods eat their own egg shells after hatching and are then cared for by the parent for the next two years—until their club-tentacles reach a weight of five pounds or so. At that point, they go off on their own, confident in their ability to survive. These half-grown snails inflict 1d6 points damage with their flailing appendages.

6. A flail snail's magical shell protects it from all magical energy directed at it—even spells that can be "targeted" at body parts other than the shell, like *magic missile*. Whenever a spell (or spell-like effect from a magical item) is cast at a flail snail, the following results occur (roll d%):

1d100	Result
01-40	Spell malfunction
41-70	Spell functions normally
71-90	Spell fails to function at all, but is expended
91-00	Spell is reflected back at the caster

Spell malfunctions are usually only slight variations of the standard spell effects, affecting the creature nearest to the snail at the time of the casting. If no other creatures are nearby (within the spell's area of effect), the spell is centered on a point near the snail (consult Table 45: Grenade-Like Missile Effects in the *DUNGEON MASTER®* Guide).

Note that the shell affects only magic cast directly at the flail snail; it wouldn't prevent the creature from being crushed by a *wall of iron* that was created next to the snail and then tipped over onto it, for instance. Also, when a spell is cast successfully on a flail snail, the snail is still granted any normal saving throws permitted by the spell.

The shell constantly expands as the snail itself grows, with new shell material being added at the base, where the creature's head emerges. The shells can either grow clockwise or counter-clockwise; those growing clockwise are called "dextral" shells, while those growing in the other direction are called "sinistral." The direction of the spiral has no effect on the shell's powers.

7. Combat with a flail snail is handled differently than with most other monsters. Each of the snail's flailing appendages has 1 Hit Die and is treated as a separate creature. Flail snails attack as creatures with as many Hit Dice as they have active tentacles; a snail with five tentacles therefore attacks as a 5-HD creature, with a THAC0 of 15. When a tentacle is reduced to 0 hit points it is useless (if attacked with a bladed weapon, the tentacle is usually assumed to have been severed) and the flail snail drops one Hit Die in power. Once all tentacles have been destroyed, the flail snail withdraws into its shell and utters the most pitiful cries imaginable until it dies some 1-3 turns later. These cries have a 50% chance of attracting wandering monsters. The flail snail's death-wails are the only time it vocalizes—it is otherwise completely silent throughout its life.

The flail snail's body has hit points equal to the total of all of the tentacles, but it is protected by the thick shell and thus has an AC of -8. For purposes of combat, the shell itself is impervious to weapons.

Thus, when fighting a flail snail, two approaches can be taken. One can either hope to slowly hack away at the creature's well-protected body or face off against the flails themselves and take them out one by one. When hacking at tentacles, a PC need only hit AC 4. If successful, the player rolls a d6 or d4 (as appropriate) to determine which active tentacle was hit, rolls for damage, and the DM determines if the tentacle is still "alive" after the attack. If not, the flail snail drops by one Hit Die (affecting the creature's THAC0 and number of attacks in following rounds). In this way, a Warrior with 18/00 Strength and weapon specialization can't take out several tentacles with one stroke just because he caused 16 points of damage with his broadsword.

8. A flail snail's slimy mucus is produced by a gland at the front of its single foot. The mucus has several uses: Besides acting as a protective coating for the creature's skin (protecting it from fire and preventing it from drying out), it is necessary as a locomotive lubricant, without which the creature cannot move. Flail snails leave mucus trails behind as they move, making it easy to track them (at least, until the mucus dries and evaporates).

9. Like most land snails, flail snails living on or near the surface also estivate during the winter months. This is usually in response not to the air temperature but rather to the vegetation—or lack

Willowquisp chose to answer Spontayne's question. "Flail snails mostly eat lichen and algae that grows on the floors of dungeons, mines, and other underground areas. They scrape these substances up using an organ in their mouth called a radula—in effect, a long, flat tongue with numerous tiny, sharp teeth laid out in rows like a file."

"How does this help us?" repeated Dreelix with irritation in his voice.

"Hmm? Oh, the estivation," said Willowquisp. "It appears to me that some spell could be used to alter the temperature and humidity of the mine, forcing the snail into a state of estivation. Then we could lug the creature out of the mine and kill it at our leisure."

"What spell did you have in mind?" Dreelix wanted to know.

"I don't know. I leave that kind of thing up to you wizards."

"I personally have nothing in my spellbooks that can help us there," offered Zantoullios.

"Nor I," admitted Spontayne.

"Me neither," said Buntleby. "However, I believe there is a priestly spell, *control temperature* or something, that could help us. Perhaps if we contacted Delbert the druid ..."

"Absolutely not!" Dreelix exploded. "We don't need that greedy fool's help! The last time he charged us two silver scimitars to cast a lousy *locate animals or plants* spell, then upped his price to four after Grindle and Zantoullios bungled the first Shambler Hunt and we needed another spell!" Both Grindle and Zantoullios exchanged looks: neither remembered the fault having been theirs. Zantoullios shrugged; he was used to being blamed for things out of his control—like those healing potions he had whipped up. So they caused the imbiber's skin to turn green and warty for a few hours; they still worked, didn't they? He made a mental note to ease off on the powdered troll's blood for the next batch.

"Anyway," sputtered Dreelix, "I thought we agreed we weren't spending any money on this!" It was obvious that he was getting excited, for his face was becoming red and he was beginning to spray spittle as he spoke. Spontayne wiped an eye and vowed to sit in the back next time.

"Another approach then," suggested Willowquisp. "The creatures shun bright light;¹⁰ perhaps we could drive it out of the mines with *continual light* spells or something similar."

"Why don't we just throw salt on the thing and be done with it?" asked Old Gumphrey. "I used to pour salt on slugs and snails all the time as a youth. Shriveled 'em up real good, it did!" he cackled.

"The problem there is the amount of salt required," replied Willowquisp.

"Well, how about this," offered Buntleby. "We wizards load ourselves up with as many *reduce* spells as we can, then take turns casting them on the snail. Eventually, we shrink the snail down small enough that we can carry him out of the mine in one of our pockets."

"I thought you said spells bounce off the creature's shell," said Dreelix, surprising everyone by proving he had been paying attention for once.

"Well, they do," Buntleby admitted, "or at least some of them will. But enough *reduce* spells thrown at the beast will do the job, eventually. No doubt we'll also shrink a few of us, but that's easily fixed with a *dispel magic* or two."

thereof—to be found in the winter months. Immediately before sealing themselves up in their shells, they go on a feeding binge, storing up as much food as they can for the long winter months. Of course, flail snails living deep underground do not usually seasonally estivate, as the seasons have little if any effect on the amount of vegetation to be found that far below the earth.

10. This is instinctual behavior, as the sun can dry out the mucus that coats the creature's moist body. Bright lights themselves have no debilitating effect on flail snails.

11. The flail snail's outer coating of mucus protects it somewhat from the drying effects of salt. However, a large enough dose (for instance, the contents of a small belt pouch) thrown at a flail snail

inflicts 2d4 points of damage the first round and an additional 1d4 points of damage the second round. After that, the snail's increased mucus production negates any further such attacks. The salt must strike the snail's soft body to be effective, as the creature's hard shell is impervious to being dried out in this fashion.

"It's the best idea we've heard so far," suggested Spontayne.

"Hmmp!" said Dreelix, not convinced. "Let's move on. What can we expect to reap from our efforts in killing the beast?"

"Ah, there we have good news indeed!" said Buntleby. "The main value of the creature is, of course, its shell, which has a market value of about 5,000 gold pieces and a wide number of magical uses."

"The most obvious use of the shell is the creation of magical shields," said Willowquisp, consulting his notes. "Two shields can be made from a single shell, which not only offer excellent protection from weapons, but also carry the shell's magical protection from spells for a number of months."¹²

"Optionally, the shell can be ground down and made into a *robe of scintillating colors*," said Buntleby.

"How many robes per shell?" quizzed Dreelix, warming to the subject.

"Alas, only one."

"Grindle, current value of such a robe?"

"About 25,000 gold," answered Grindle, who kept hundreds of such values stored in his head—he

wasn't called "the Coin-Counter" for nothing. There were numerous appreciative whistles at the value, one of them belonging to none other than Finklebintzer the gnome.

"Anything else?" demanded Dreelix.

"Optionally, the shell can be brewed into several *potions of rainbow hues*," submitted Willowquisp.

"Grindle?"

"A negligible sum, compared to the robe."

"I thought as much," replied Dreelix. "So then, anything else?" he asked to the two at the podium.

"It is believed that the creature's 'love darts' may be used in *philters of love*," said Buntleby.

"Love darts? What in the world is a love dart?"

"A small, sharp dart of shell-like material made in special sacs in the creature's body," answered Willowquisp. "You'd learn of things like this if you allowed us to brief fully, instead of concentrating only on combat and useful body parts. The flail snail mating ritual is really quite fascinating. First, the snails—"

"A subject for another time,"¹³ interrupted Dreelix. "So, *philters of love*, huh?"

Okay, what else?"

"Nothing definite," admitted Buntleby. "Although given the creature's immunity to both fire and poison, it's possible that there are useful flail snail by-products that provide such protection as well.¹⁴ That's all I've got. Willowquisp?"

"Nothing anybody here'd be interested in hearing," grumbled the old sage, packing up his notes and returning to his seat.

"All right, then," beamed Dreelix, his mood vastly improved by the thought of all the money the Association would soon be raking in. "We'll

try that shrinking tactic of yours, I guess, Buntleby. All wizards able to cast the spells *reduce* and *dispel magic* will memorize them to capacity. We'll meet here tomorrow at first light. Any questions? No? Then thank you for bringing this to our attention, uh, Flinkybinky, and rest assured, the monster is as good as dead. You may be excused from the rest of the meeting; we'll just be taking up other boring little bits of business, and you no doubt wish to be on your way ..."

"Actually, there is one final bit of business we need to discuss," replied the gnome.

"That being?"

"The sale of the flail snail. I have decided to withdraw our request for aid; instead, I now offer for sale a living flail snail, yours for the taking, for the small sum of 10,000 gold pieces, a price you will no doubt find very reasonable."

"WHAT?" roared Dreelix, as the audience members gasped in astonishment. "Ten thousand gold? What kind of a joke are you playing at?"

"No joke," replied the gnome. "You yourself said you stand to gain 25,000 pieces of gold from the magical robe you plan to make from the snail's shell; I see no reason why some of that money shouldn't be sent our way. We are, after all, a simple village of poor miners, and the sum will be put to good use. Plus, it's our snail, to do with as we wish, and we now wish to sell it."

"I thought the snail was a 'hideous, giant brute' and a 'terrible creature,'" pointed out Buntleby.

"After listening to your discussions, I have elevated it to the status of 'treasured pet.'"

"But what of your miners?" Buntleby continued. "Three have been killed so far; more deaths may occur."

"As has been pointed out, the creature is essentially harmless—it killed only

12. These are *shields* +2 and provide protection from spells for 1–6 months in the same manner as the shell does for the living flail snail (40% chance of spell malfunction, 30% chance of it working normally, 20% chance of total negation, 10% chance the spell is reflected back at the spellcaster). Even after the spell-altering effects of the shield fade, it remains a *shield* +2.

13. Or, the subject of a footnote: Flail snails begin the mating ritual by slowly circling each other, then rubbing their heads and feet together. The love darts project from the creatures' bodies and stab into their

partner, causing neither pain nor damage. Different snail species produce differently-shaped love darts, so it's very likely that this serves as a form of recognition for the two snails involved, to ensure that they're mating with an appropriate species (pretty embarrassing to have mated with the wrong species entirely, but we digress). It also stimulates the snails' bodies, preparing them for the act of mating. Flail snails cannot produce sperm cells without first having sampled their intended mate's love darts.

Hey, it works for them.

14. And there are: The stomach and liver of a flail snail, when ground up and mixed with flail snail blood, are valuable ingredients in an *elixir of health*, negating any previously-ingested poisons. Flail snail skin, along with a small coating of the mucus that normally covers it, when finely ground can be used in the creation of *potions of fire resistance*.

In addition, flail snail mucus, although not a standard ingredient, can be used to create *potions of climbing*. However, this thickens the potion so much that it takes two full rounds to imbibe (and does nothing to enhance the taste, to say the least).

those miners trying to kill it,"¹⁵ responded Finklebintzer. "If we leave it alone, it should leave us alone. And I'm sure even we gnomes, with our stumpy little legs, can manage to outrun a snail, no matter how big!"

"This is preposterous!" thundered Dreelix. "Buntleby, I hold you personally responsible!"

"He's got a point, though," argued Buntleby. "I know we regularly exploit the creatures around us for their magical uses, but that doesn't mean we should similarly exploit those individuals who bring business our way. And we'd still be making fifteen thousand to our profit."

"We're not in the business of buying monster parts; we're bold Monster Hunters! We stalk and slay to our own advantage; we do not haggle over prices like fishwives at the market! Now, I think we've wasted enough time on this. Stinkyfink, if you no longer wish us to rid you of your snail—free of charge—then we have no further business to discuss, and I suggest you vacate the premises, before you are charged a wasting-the-Association's-valuable-time fee."

"Five thousand," offered the gnome.

"Out!"

The small gnome dropped from his chair to the floor and bounded out the door, giving Dreelix a nasty look and a gnomish hand-gesture of dislike on the way out.

Dreelix immediately turned back to Buntleby, face flushed with anger.

"Uh-oh, here it comes," whispered Buntleby to Willowquisp.

"Tirade time," agreed the elderly sage.

"Of all the arrogant, MONEY-GRUBBING little gnomish TOADS!" screamed Dreelix in fury, spittle flying freely in all directions. "Buntleby! How DARE you bring such a person in here without notice? You've not only WASTED our valuable time, but you've managed to BESMIRCH our good name in the neighboring communities! No doubt that GREEDY little pile of PIG-FILTH will return to his stinky little gnome-home and tell his fellow SHRIMPINGS how the Monster Hunters refused him aid! This is all your fault! Why, I've got half a mind to..."

Having heard enough, Buntleby caught Zantoullios' eye and saw reflected there a shared determination to put an end to Dreelix's ravings. Fair's fair, after all, he thought.

Standing as one, the two wizards began speaking in an arcane language,

wagging their outstretched fingers at the red-faced leader of the Monster Hunters. Dreelix immediately stopped his ranting and raving and plopped back into his seat, a blank expression on his face.

The Monster Hunters in the audience watched in silence as Dreelix stared ahead at nothing. Then, blinking as if to clear his head, he looked around in confusion. Grabbing his gavel as if to draw strength from it, he spoke for the first time since the *forget* spells hit him.

"Where was I? Oh yes. It seems we have a rather heavy agenda tonight. After Grindle briefs us on the sad, sorry state of our coffers, we'll have an update on the problems with Zantoullios' latest batch of healing potions—something about unexpected and unpleasant side effects—what's everyone smirking about?"

Johnathan M. Richards does most of his flailing in the swimming pool. Swimming requires the kicking of legs, the stroking of arms, and proper breathing. Pick any two of the above, and he can handle it—it's only when he tries all three at once that he becomes a menace to those in his immediate vicinity.

15. If left alone, a flail snail is completely nonaggressive. It is only when other beings approach (within the 20' radius of its sensory abilities) that the flail snail attacks with its flailing appendages. Even

then, once the intruder steps out of range, the flail snail does not pursue and goes back to its algae-grazing. Only other giant snails are not attacked immediately; if a flail snail is approached by another

giant snail, it begins production of a love-dart in anticipation of a possible mating.

A little gnoll-ledge can be a dangerous thing

The Sociology of the Flind

by Spike Y. Jones

"Aidan, come away from the window."
"But I heard a wolf," whined the boy. "I want to see it. It sounded strange."

"Curiosity is fine in its own time, but now you must come away from the windows." Another eerie, laughing howl was heard, still distant but approaching through the cool autumn evening. "It's time you were off to bed."

"But it's not bedtime yet," a third voice chimed in, to be followed by a fourth. "Fiona's right, Mr. Farwanderer. We don't have to go to bed until the guests and the help start arriving in the common room. Father said so before he left."

"Tonight is different," replied the bard in

a tone strangely weary and tense for a man usually more energetic than some half his age. "Go upstairs *now*."

"Might as well not argue," Aidan said to his sisters, a sly look crossing his freckled face as he thought about the upstairs windows. "We'd better just go."

Halfway up the stairs, the eldest, Grainne, silently stopped her siblings. Through the railing, they saw the bard shudder, then cross the room to take a bottle of wine back to the fire. He settled himself uneasily in his chair and began to drink at an uncharacteristically quick pace, pausing every few gulps to peer over his shoulder at the windows and the door

that led outside to the lingering twilight.

Ignoring the bard's orders, Grainne silently returned to the ground floor, the others following at her heels. "Mr. Farwanderer," she began, but faltered when the surprised bard spat a mouthful of wine into the air. The nearly full bottle crashed to the rush-strewn floor.

"Child, what are you doing skulking behind me?" snapped the bard. He appeared more agitated than before. "I thought I sent you away!"

"You're afraid of something!" blurted Aidan, hoping to redirect the bard's anger. "It's the wolf outside, isn't it?"

Brendan Farwanderer paused, an angry

Artwork by Jim Holloway

banishment on his lips. He saw the concern on the faces of his charges, then swallowed and nodded, visibly controlling himself. "I am . . . concerned." He bent forward to put an arm across the boy's shoulders. "And yes, it is because of the howlings. But those are not the sounds of a wolf, and it is not the beast but the message he brings that worries me."

Hoping for the beginning of a story, Grainne drew her little sister Fiona to the child's usual seat at the foot of the bards chair, but when Aidan made to go to the board for a bottle to replace the one lost, the storyteller restrained him. "No, boy, it is probably best that I not drink any more this evening. And I cannot afford to sit down for this tale, as I have preparations to make. Attend as you will, for I shall be moving a bit."

The bard began to assemble provisions and equipment on the room's center table, gathering them from the shelves of the inn's kitchen and storerooms with his single hand, his right. The children hesitated briefly before rising to their feet to follow him about.

"At a time just after you were born, Aidan, maybe ten years ago, I was on an expedition in the Imbran Mountains. There were six of us: three warriors, an enchanter, a priest of Marduk, and myself. At first, we had no clear goals but to find adventure, win fame, and possibly make profit. Eventually, we got ourselves hired for a mission; to remove a troublesome band of gnolls from one mountain valley before they denuded it of all game. There was a single human village at the valley's end, and a few villagers had been attacked by these beasts when the former were out hunting in the wilds. It was feared that the gnolls would turn on the settlement once other prey became scarce.

"At first, we thought that it would be an easy thing to eliminate the gnolls, for we consistently found them in groups smaller than our own. In a few of the encounters, the gnolls we faced threw their weapons away and dropped to the ground in surrender."¹

The bard paused in his tale-telling to select a few dusty items from an alcove off of the inn's common room. As he pulled out a short sword, his voice became deeper and quieter.

"Unfortunately for those creatures, one of our warriors, Hrarfarr of Pah, was a forest-wise barbarian whose mountain tribe considered surrender to be the most dishonorable thing a man could do. Every time one of the gnolls put himself at our mercy, Hrarfarr immediately slew him. And none of the rest of us said a word to censure Hrarfarr, for it was both a matter of honor for him and of logistics for us. We could think of no way to deal with a growing collection of prisoners, and to release our enemies into the forests would have resulted in future attacks by an enemy forewarned."

Brendan Farwanderer's voice regained

its normal timbre. "After a few days of these skirmishes, Hrarfarr returned from scouting in the valley to announce that he had found the lair of the gnolls we'd been meeting individually thus far. We soon made for the ruined citadel where he said the gnolls were, but darkness fell as we arrived. Although we had set up some of our previous ambushes at night, we decided that it would be best to use the advantage of full daylight for this assault. We believed—wrongly—that the nocturnal gnolls would be at a disadvantage."²

"The quality of Hrarfarr's scouting was soon proven, for our nearby quarry made the night almost unbearable with an hours-long chorus of the same laughing, barking howls that we heard earlier tonight. But there was a difference in the sounds we heard that night, something more sinister that set our hair on end and denied us anything but the most fitful of sleep. When the sun rose, we were still tired, and only Hrarfarr's exhortations prevented us from postponing our mission until another day."³

"We crept into the ruins, seeking to eliminate the perimeter guards one by one and thus spring upon the main camp without warning. At first, this seemed to be successful, as we encountered only solitary or paired gnolls as we had in the days previously. All surrendered, to be slain by Hrarfarr or the other fighters. We had silenced more than a few guards when Marduk's priest noticed something disquieting. Our most recent victim was armed not with the simple club we'd encountered to that point, but with a curious weapon made of a pair of short iron bars linked by a chain, which he used in a most facile manner to disarm one of our fighters before finally surrendering and being despatched. This weapon the priest identified as a flindbar, and he informed us that the creatures we faced were not normal gnolls at all, but a tougher and more intelligent variety referred to as flinds."⁴ But we were already committed and so made nothing of this information.

"After a few more of our little ambushes, we found the tables turned on us." The bard paused at a dark memory. "The flinds had sacrificed a number of their own in order to lure us deeper into the ruins, to an area of *their* choosing. Upon engaging our next pair of beastmen in melee, the toppled pillars and ruined houses spewed forth flinds at all quarters."⁵ We were set upon by scores of them, those in the forefront wielding their flindbars with blinding speed. Quite contrary to our designs, they split our party asunder before we could assume a proper defensive posture.

"In little time at all, Hrarfarr and I were isolated from the others, surrounded and unable to retreat. After a few moments more, all other sounds of combat ceased; we two were the only surviving remnant of our band.

"Much to my surprise, the flinds did not

press their advantage. Rather, they retreated a pace and took defensive stances as if waiting for something. Before I could turn to my remaining companion and suggest a prudent course of action, he bellowed his barbaric war cry and charged forward, to be bludgeoned to death from numerous directions in less time than it takes to tell of it."

Brendan was silent for a moment, remembering, before he continued. "Knowing that I had little hope of fighting my way out, I realized what it was the flinds were waiting for. Mimicking the actions of the many defeated flinds we had slain, I dropped my sword and fell to the ground in the center of the circle of my enemies, praying that I had not misjudged them.

"After removing from me anything that could be used as a weapon and binding me securely, these flinds began arguing among themselves, barking at the top of their voices with only occasional glances at their prisoner. Before long, one, evidently their leader, turned to me and began to ask questions in a variety of strange tongues, the third of which, Orcish, I understood. Once he had found a language we held in common, he immediately ordered all his tribe to conduct their argument in that tongue, 'for the benefit of our guest,' he said.

"To my dismay, they were fighting over the method of my execution. One suggestion was that I be sold to a party known as the Human-Hunters, whom I was later told were a clan of gnolls that stalked and ate humans to the exclusion of all other races, even keeping a few alive in pens to be used for ritual sacrifices to their evil god. But my captors were too revenge-hungry to allow others to sacrifice me as their totem."⁶

"That option discarded, some recommended that I be entered into slavery, suggesting some sort of ritual disfigurement to avenge the deaths of those flinds whose honorable surrenders my party had betrayed, but agreement could not be reached on what the disfigurement would involve: eyes, ears, both, more, whatever."

"Hands?" whispered Aidan, prompting tears to well up in little Fiona's eyes. The children involuntarily glanced at the place where the bard's left arm ended in a stump.

"No, not hands. A slave without hands is of little worth, Aidan. Those who wanted my hands removed suggested that only as a preliminary to other tortures.

"Finally, the hotheads won out over those advocating slavery, and it was decided that I was to be slowly roasted alive. But before they completed preparations for my pyre, a ripple appeared in the ranks of flinds surrounding me, and one flind approached, accompanied by a trio of foul undead."⁷

"This one was apparently the highest-ranking witch doctor in the tribe, and he came making a demand. His son and apprentice had been killed in one of our

earlier ambushes. As the shaman put it, his son had been stolen from this world by our party. As I had already been condemned to death, he demanded that my execution be in the form of a ritual death and rebirth as his new son: a man stolen from the world of humans and forcibly adopted into the clan of the flind.⁸

"The leader of those demanding my death was apparently the mightiest warrior of the lot whose name translated to Grinds-Bone-To-Dust in Orcish. He stepped forward and told the witch doctor, whose name was All-Fear-His-Howl, that my fate was sealed and that nothing could be done to change his mind. The witch doctor was not easily dissuaded and began to harangue the warrior—at first in Orcish, as they had both been speaking for my benefit, but eventually reverting to their own tongue as the argument became more heated.

"As the volume of their howling increased, the two made threatening gestures at each other. Grinds-Bone-To-Dust swung his flindbar within inches of All-Fear-His-Howl's face, while the latter in turn brought forth various magical tokens and threatened dire enchantments in the warrior's direction. The fur on both of them stood on end, making them look half again as large and fearsome to me, the object of their squabble.

"Finally, the witch doctor gained the upper hand when he gestured his undead guardians forward to stand at his side, then presented one particularly powerful talisman that I later was told would have summoned a special unholy assistant directly from their demonic lord.⁹

"The warrior's fur immediately fell back to its normal place, and he seemed to shrink in the face of the witch doctor's threat. Backing away, he made to leave. But as his eyes lit upon me, the hatred he obviously still harbored for the other flind was revealed. A shrewd look appeared on him, and he raised himself erect to inform the assembled band that he respected All-Fear-His-Howl's decision and would personally insure that I, whom he dubbed Long-Legged-Child, became a perfect example of a flind. For if I failed in any respect, he would slay not only me for my failing, but also the witch doctor and his entire family line for forcing an imperfection on the tribe.

"Over the course of the next year, I was forcibly taught much flind lore by my so-called father, who feared that my mistakes would cost him his life. I learned even their history and the intricacies of their language and social structure. I was treated not as a human changeling but exactly as a flind. Thus, I was bruised and beaten many a time by males, females, and even those pups who realized they could get away with it, usually led by the offspring of Grinds-Bone-To-Dust who had appointed themselves my tormentors.¹⁰ Violence is integral to the life of a flind, as I learned to my grief; it is part of the process of tough-

CRUSADERS *of the* DARK SAVANT

The Sequel to Bane of the Cosmic Forge

ening the tribe, or so they see it. This treatment went on until I gained the skill with the flindbar needed to defend myself against my more powerful 'relatives.'¹¹

"In retrospect, it is well that I did not fall into the claws of common gnolls. The flinds, though they share many of the manners of their less pleasant cousins, are more likely to obey the rulings of their leaders and work together as a whole. Being now considered a flind, I was immune to outright murder. Had I been among gnolls, one group or the other would have done for me long ago, regardless of what the witch doctor had decided. It was poor comfort that long year.

"At first, I was resolved to play the part of a happy convert. But before the year was out, I could no longer play the role, as I was introduced to a practice that I could not be forced to suffer. During one of the tribe's nomadic migrations, we came a cross an isolated farmhouse that the warriors attacked. I could do nothing to save those who were murdered there. Instead of eating the bodies of those they slew, the flinds abandoned them to go through the gate to a recently dedicated cemetery behind the house, where they immediately set to digging."

"When they came upon the bodies there, All-Fear-His-Howl stepped forward and inspected them all, claiming the one in the best repair as his own and magnanimously

declaring the rest to be the property of the warriors, who immediately set to squabbling over who got first pick of the disinterred remains. Once the flinds had settled the question of rank, they began to eat the bodies. Before my reeling stomach could betray me, the witch doctor pulled me aside to demonstrate another atrocity.

"He forced me to carry the corpse he had selected to the site of the massacre of the farm's inhabitants and, as I followed him, I was followed by his trio of ghouls, all hoping to somehow get a taste of the body. I was ordered to place the corpse next to the remains of the newly dead. All-Fear-His-Howl then began to perform some ritual over the bodies.

"After an interminable period, the exhumed body began to twitch and rock, while the recent kills became flaccid and empty of all contents, now little more than a collection of bones and skin. And then, suddenly, the jerking corpse's eyes opened, and it stood up, the horrible stench of the dead assaulting my senses like never before. The witch doctor had created a more powerful undead servant in the form of a ghast.¹³

"After seeing these depravities, I was awakened to the fact that I had almost resigned myself to spending the rest of my life with these monsters. Nothing could then convince me to continue in their unholy company. I renewed my interest in

delivering myself from them. Eventually, I found an opportunity to escape when my tribe encountered a small tribe of orcs that we set upon. While the flind tribe was engaged in the wholesale slaughter of their neighbors, I made good my escape. As I have not encountered a flind in the years since, I made the assumption that I had been forgotten by them, or that they had written me off as if I were a bad debt."

As far as the children could tell, Brendan Farwanderer's packing was finished. He had collected all of the materials a man would need for a journey of a week or more, including a shirt of fine chain and the sword he'd handled earlier. For some reason, he didn't put on the armor or pick up his pack; he merely stood, silently staring at his equipment.

"Mr. Farwanderer—" began Aidan, but he never finished his thought.

Without warning, the door to the inn banged open. The children jumped; the bard did not move. As a cold evening wind brushed past them, what appeared to be an elderly or crippled man shuffled painfully in, supported by the strong arm of another, apparently younger, man.¹⁴ Both were wrapped from head to toe in thick cloaks, with even their faces covered and hidden inside dark cowls. Neither of them unwrapped himself, nor did either move to sit near the banked fire or at one of the long benches along the walls. For almost a

minute, the older one stood hunched in the doorway, his unseen face apparently directed at the bard, who kept his back stiffly turned to the newcomers.

"Long-legs, come," the old one said in a harsh, muffled accent, breaking the tense silence. His mouth did not seem right, as if it were more an animal's muzzle and unused to speaking human words. "Leave pups. Time now be adult!"

"Yes, a moment," the bard said, then focused his attention on the children. His face was drawn and white. "Every gnoll or flind must prove himself to his clan by stalking and killing a creature from his tribe's totem race, thereafter to be counted an adult. If he does not perform this duty within the span of one generation, he is slain by the leaders of the tribe, to prevent the taint of cowardice from spreading.¹⁵ I made good my escape before performing this task, but there is now a delegation from my tribe, undoubtedly composed of Grinds-Bone-To-Dust and a party of his sons and grandsons, waiting for me now outside."

He paused. When he tried again to speak, his words caught on something and he had to clear his throat before beginning anew. "If I do not do their bidding, they will slay my 'father' and then do their best to kill all of his kin, including any human children they mistakenly count as All-Fear-His-Howl's adopted grandchildren."

"And his true grandchildren, 'uncle,'" growled the able-bodied stranger in rough Common, having overheard the conversation from across the room. "They will kill us all if you fail your tribe. Unless someone from your own family doesn't kill you first, you who runs from adulthood."

The bard moved again, folding the mail shirt into his pack and easing the satchel across his shoulders. The children were silent, stunned by the implications of these last statements. Finally, Grainne spoke up. "Shouldn't we be doing something?" she whispered, her eyes on the visitors and her arms reaching down for her siblings, to pull them close.

"We could call out the town militia," Aidan suggested in a remarkably restrained manner.

"No, Aidan," said the bard softly. "Grinds-Bone-To-Dust's forces will be waiting for just such an excuse to slaughter all in this town without fear of repercussions from the rest of the tribe. When your father returns home from the markets of Thamox, tell him this tale and tell him to circumspectly prepare the defense of the town, but warn him to make no overtly hostile moves. You should be safe enough alone until the tavern help and guests arrive in a few hours, if I give the flinds no cause to doubt my willingness to comply with their bloody custom. And if you bar the doors and windows, as I had meant to do."

Turning, Farwanderer gingerly picked up his sword, then crossed the room to put it back in its alcove. He returned with a well-wrapped bundle that he placed on the table.

"The word 'flind' is thought by some to have once been merely the name of a particularly strong gnoll clan. If so, that clan is now a thing unto itself. 'Flind' means 'cannibal' or 'gnoll-eater' in Gnolish.¹⁶ Flinds, though they are the masters of all gnolls, hate their lesser cousins scarcely less than they hate all other beings. To become an adult, a flind must slay a gnoll to prove the prey's unworthiness and the hunter's superiority. The howling that we heard earlier was that of All-Fear-His-Howl, telling any gods, flinds, or gnolls within hearing that his 'son' will meet his obligation tonight, or die trying. And thus, I must go." The bard's voice dropped to a husky whisper, "If the gods of man go with me, I will return an adult in the eyes of the flind a few days hence, and I will be able to order my . . . kin, as it were, to leave us in peace."

Removing the oiled cloth from the parcel, Brendan hefted a pair of chain-linked iron bars in the lamp light. Then he left the inn, closely following his father and nephew in their all-enveloping cloaks.

Footnotes

Flinds and gnolls are detailed in the AD&D[®] 2nd Edition *Monstrous Compendium* (under "Gnoll") and in the AD&D 1st Edition *Monster Manual I* (page 46) and FIEND FOLIO[®] tome (page 39). Also see "The humanoids" in the *Best of DRAGON[®] Magazine* anthology, vol. V, pages 54-57.

1. Unlike some other evil humanoids, gnolls and flinds rarely continue a losing fight to the point of their own deaths. If outnumbered or beaten, they attempt to flee or, if that's not possible, surrender by throwing away their weapons and falling face down on the ground, leaving themselves to the attacker's mercy. Because it is standard gnoll behavior, they recognize the same sort of posture when performed by enemies (including such variations as standing upright with empty palms turned outward or with empty hands in the air, or even approaching with an empty hand out-thrust to be shaken). Usually, unless extremely hungry, enraged, or when attacking a totem creature (see note 6 below), they respect such behavior—for a while, at least.

2. Gnolls have 60' infravision and prefer to hunt at night. Their senses are all animal-sharp, so that they can follow a scent day or night almost as well as a human could follow a visible trail during the day. They can see quite well in the dark, and their hearing is as good as a watchdog's. If given a choice between attacking a human target in light or in darkness, they chose the dark, as their opponent is at a disadvantage. Gnolls and flinds are not at all hampered by sunlight and, unlike orcs, fight during the day with

no penalties.

3. The laughing, hyenalike howls of the flinds and gnolls are social challenges that list the personal history of the howler, including his lineage and family history, his name and personal triumphs, and finally the descriptive threats of what will occur when the gnoll defeats an enemy in combat. In special cases, when a gnoll or flind expects to face a member of his clan totem-race (see note 6 below), the challenge will be made longer by a detailing of the clan history.

A normal challenge lasts as long as 10 minutes (depending on the age and history of the howler), while an extended challenge can last longer than half an hour. As it would take hours for all members of a large group to make their challenges, these howls will not be heard every time one encounters gnolls, but only when considerable warning of an attack is deemed harmless.

Tribal etiquette requires that howlers take turns, with leaders making the first challenges, followed by the rest in descending order of rank within the band. If, as often happens, two gnolls begin their challenges simultaneously, the two will raise the volume of their recital while also expanding upon their personal glories in an attempt to force the other to stop howling (an admission of inferiority). If neither gives in, the dispute is settled in one of

two ways: Normal gnolls enter into a duel that rarely continues to the death (see note 1), while flinds leave the matter until the two disputants enter combat with an outside enemy, with the valor shown on the battlefield deciding the matter.

Any group subjected to an extended bout of gnoll-howling (longer than one hour) will have to make a morale roll in order to resist the urge to rout. This applies only to NPCs; player characters should be told that they feel exceptionally uncomfortable, and the actions of any NPCs in the group, including animals, must be rolled for. Even if the morale check is made, future checks will be at -1 (cumulative daily, up to -10) during the next day. Thus, in an extended campaign against a large number of gnolls, the nightly howling is almost assured to cause some desertions in the ranks of non-gnolls.

Those who can understand the barked language of gnolls or flinds can ignore the effects of this howling, as they can concentrate on the meaning of the howls instead of the nature of them. Of course, a long night of graphic death threats may not be conducive to sleep, either.

4. While the physical differences between gnolls and flinds are apparent to one versed in monster lore, to an ignorant warrior in the middle of melee these two races are indistinguishable. It is more likely that outward signs, like the flind's

preference for blunt weapons (such as flindbars), will serve to distinguish the two for the average adventurer better than intrinsic body features such as the shape of ear or the slope of brow, or differences in lifestyle that are only exposed to those making in-depth studies.

5. Although they travel in groups of 2-12, gnolls and flinds are often encountered as solitary individuals who turn out to be outrunners or stragglers from a slightly larger group. Gnolls are individually very independent, so an encountered group of 2-12 might be spread out over a few hundred square yards of woods, in pairs or alone in a round or two, all close in on the sounds of an attack against one of their number. Still, while nominally chaotic, gnolls respond to strong threats by grouping together to fight the menace before splitting up again when safe. Flinds are far more organized, having standard tactics and a rough (if abused) chain of command. Flinds sometimes mimic this loose formation anyway to lure the unwary into traps that normal gnolls would rarely think of nor be able to organize.

6. Gnoll society is divided into a number of clans, each with its own clan totem—a specific race of prey that has religious significance to the clan. Among other ritual uses for these totem creatures is ritual sacrifice to Yeenoghu (AD&D 1st Edition *Monster Manual I*, pages 19-20,

and 1st Edition *Legends & Lore*, page 94), as the sacrifice of a creature that isn't of the clan's totem race is unlikely to win the archfiend's favor. Gnoll tribes led by flinds, as well as flind tribes themselves, sometimes keep specimens of the tribal totem for just such purposes.

The most common totem races are goblins, humans, gnomes, halflings, and elves (but not dwarves, as they are too stoic during combat and torture to be interesting). Some gnoll clans have totems that are stronger than individual gnolls, and their tribes are composed of only the bravest of gnolls, but they are rarely large tribes. Such clans include the ettin and giant hunters.

Conversely, some large tribes have weak totems, such as kobolds or nonintelligent prey like deer or zebras. These tribes have a low status among gnolls, but they are also quite long-lived due to the ease of conforming to the demands of their religion.

The large gnoll clans are divided into numerous smaller tribes of 20-200 adult males (young and females are almost ignored by the males). Two tribes from the same clan will almost never fight with each other, often joining together for short periods of time to attack particularly large targets. Unrelated tribes are generally less friendly; the only time a tribe of gnolls won't leap upon a tribe of a different clan (except when prevented by a strong lead-

er) is when the other tribe is of equal or greater strength.

The purpose of combat between tribes is not to kill the opposing tribe, but to either gain slaves from among the survivors or merely to establish which of the two tribes is the stronger in a way that neither can dispute. To avoid such battles, obviously weaker tribes will sometimes pay tribute to the stronger in the form of slaves (taken from among their own slaves, not from the tribe's members), especially if they have slaves from the stronger tribe's totem race.

Because they are trained in specific tactics to use against their totem creature, and because of the ferocity religious fervor adds to their actions, gnolls have +1 to hit, damage, and morale when attacking their totem race. Unfortunately, this ferocity means that gnolls attacking their totem tend to lose themselves in the activity. Thus, they won't accept the surrender of a totem creature if it is offered in the heat of combat.

7. All gnolls and flinds worship the archfiend Yeenoghu, and a few gnolls (two in 100) and flinds (three in 100) become shamans or witch doctors who have a closer and more powerful relationship to their deity. Gnolls can be shamans of up to 5th level, or witch doctors of up to 5th level as clerics and 2nd level as mages. Flinds can attain the same shaman level as

normal gnolls, but as witch doctors they can reach 3rd level as mages.

As with other tribal spell-casters, the spell selection of gnolls and flinds is extremely limited. Unlike other races, these spell-casters typically choose spells to enhance their own power, not necessarily for the betterment of the tribe. Gnolls do not hold any great respect for their shamans, but they do fear them, and fear is a more effective form of command in the chaotic gnoll society. Flinds respect their spell-caster but still curse them in public.

Their favored spells include: **command**, **protection from evil** (as gnolls often fear each other more than good-aligned outsiders), **shillelagh**, **enthrall**, **hold person** (to emulate the paralysis power of their deity's chosen undead henchmen), **armor**, **shield**, **invisibility**, **irritation**, and **strength**.

In addition to their personal powers, gnoll spell-casters have other ways of instilling fear in lesser beings, the most common of these being that they are often (60%) accompanied by 1-6 ghouls that they automatically control, as these undead are a gift from their deity.

8. Those who surrender to gnolls will usually be killed or made slaves, but a rare few of those taken will be adopted into the tribe to replace tribe members killed during the capturing process. Such adoptions are usually only made of gnolls from other tribes, but there have been cases when members of other races are so adopted (this is more common among flinds).

9. Another gift that Yeenoghu occasionally grants his most powerful shamans (those of 5th level) is the ability to summon a special form of guardian, a giant, glowing, undead hyaenodon called a shoosuva. For more details concerning gnoll shamans and the shoosuva, see "The Humanoids," in the **Best of DRAGON Magazine** anthology, vol. V.

10. The lair of a flind tribe is similar to that of normal gnolls. It contains 10-100 males, females totalling up to 75% of that number, and young (who mature at five years of age) up to twice the number of females. Females are as powerful as males but are rarely if ever proficient with flindbars. In addition, there will be one slave (of any race) for every five males in the tribe. For every 20 normal male flinds, there is one leader (as described in the **Monstrous Compendium**), and the strongest of these will be considered the chieftain.

Experience point values for the various flind types are: normal flinds—65; flindbar-armed flinds: 120; flind leaders (all with flindbars; includes chieftain): 175. Experience-point values of shamans and witch doctors must be calculated using the tables on page 47 of the **Dungeon Master's Guide**.

11. The flindbar is a weapon similar to the Oriental nunchaku, but slightly smaller and less damaging. Anyone but a wizard who is adopted into a flind clan can learn this weapon in a few months if he has an

open proficiency slot. The flindbar can be used for parrying and for normal strike/thrust attacks, getting two attacks per round and doing 1-4 hp damage on each hit. It cannot be used for called shots or disarming attacks (as described on pages 65-66 of the **Complete Fighter's Handbook**), but when used against small- to man-sized foes holding weapons, successful flindbar attacks automatically disarm opponents who fail to save vs. wands (with two-handed weapons granting the holder a bonus of +4 on the save).

Anyone without proficiency in the flindbar who attempts to use one in combat has (along with the normal nonproficiency penalty to hit) a chance of injuring himself when attempting any strike, parry, or disarming maneuver. If a 1 is rolled on the attack die, not counting any modifiers at all, then the user of the flindbar has hit himself, taking 1-4 hp damage and dropping the weapon if a save vs. wands is failed. (If the DM is already using the optional critical fumble system from the **DMG**, page 61, a nonproficient flindbar user will suffer this fumble result on a roll of a 1 or 2.)

12. One group of scents that the gnoll's keen sense of smell is practiced at detecting are those involved in the burial of dead humanoids. If the scents of freshly turned earth and dead meat reaches their snouts, they are more likely to seek out this

source of food than they are to go through the trouble of hunting on their own. While the scent of slightly rotten flesh is revolting to a human, gnolls and flinds—the worshipers of the prince of ghouls—find it almost irresistible. If flinds are settled into an area and are not desperately hungry, they sometimes bury their kills in a guarded area in order to "age" them as a delicacy. Most gnoll tribes have yet to take up this practice.

13. While Yeenoghu grants the gift of ghouls and shoosuvus to both gnoll and flind spell-casters, one gift is reserved for his more intelligent priests. Some 20% of flind shamans of 4th or higher level know of a special ritual to create a ghost. A spellcaster with this spell in his repertoire rarely has more than one ghost in his entourage, because ghosts are more independent than ghouls, obeying commands only 50% of the time (although they will never willingly attack the shaman who created them). Another method of ghost creation is described on page 19 of the **FORGOTTEN REALMS**® supplement, **REF5 Lords of Darkness**.

14. Because gnolls are usually encountered at least partly if raggedly dressed, one does not always notice the fact that their legs are short for their body length, if one uses the human form as a standard for comparison. Although this makes a gnoll look somewhat clumsy to differently

—Wiz̄ar̄d̄ryt—®

CRUSADERS of the DARK SAVANT

As rich a tale as ever told

proportioned humanoids, it does not in any way hamper their movements. The normal walk of a gnoll resembles the rolling stride of a human sailor returning to land after a long ocean voyage. When a gnoll is at a run, he will bend deeply at the waist so that his arms are almost brushing the ground. This awkward, hunched running posture becomes more pronounced as a gnoll ages, so that the elderly (those over 30 years old) often maintain this bent attitude even when walking or just standing still.

15. This requirement to kill a member of the totem race in order to be considered an adult gnoll is not a hard and fast one. Small or weak bands tend to ignore the law in order to preserve their population, while tribes with totems such as a troll or hill giant usually relax the rule to allow a party of adolescent gnolls to attack one of these creatures in concert, with all of the survivors claiming the kill. Normally, this initiation rite is undertaken when the young gnoll is 8-10 years old, but some (such as those in giant-hunting tribes) don't perform this task until their prime adulthood, 15-25 years of age. If a gnoll is adopted into a different gnoll clan, he is considered a child again and must fulfill this requirement anew in order to become an adult of the new clan.

16. Many flinds have the gnoll as their

totem animal, so it is unlikely that a player character will ever have to worry about the bonuses flinds receive when attacking their totems (the bonuses are the same as those for normal gnolls). Because flinds have dominated other gnoll clans for unknown centuries, they hold themselves as if they were a different species, never stooping so low as to voluntarily mate with their weaker cousins. This dominant position is made easier by the flinds' higher intelligence and the use of the flindbar. Ω

SUPPORT YOUR LOCAL GAME CONVENTION!

A game convention is the perfect place to make new friends who enjoy the same hobbies you do — whether you like board games, role-playing games, miniature war games, or just shopping around. If you've never attended a game convention before, please check out the Convention Calendar feature in this issue for the game convention nearest you. Take some of your own gaming friends along, too — and make it an experience to remember.

Letters

Continued from page 5

From what I recall in the original letter, I have come up with these solutions to the problem:

1. Give Norb to Andre and Gwendolyn, since there will always be someone looking out for him. Let Andre and Gwendolyn switch back and forth on adventures.

2. Joint custody may also be a solution. It would be hard for Norb, but both parties would be satisfied. (This should be a last resort.)

3. Give Norb to Sir Ronis, but on one condition: to never leave Norb unless it was with someone he could trust.

I'm still in favor of advancing the campaign by 16 years to let Norb go adventuring on his own. It's a heck of a lot simpler that way. But a cruel DM could force all three "parents" to live together and care for Norb, who will no doubt love the arrangement and take every advantage of it. ("Norb, I'm sure Daddy Ronis will be happy to buy you another Teenage Mutant Ninja Tarrasque if you would only tell him where you hid his bill-guisarme collection.")

Dear Dragon,

I'm writing to talk about girls. It may not seem important, but for me as a player, a DM, and a boy, it is. Where are girls at role-playing games? I'm 15 years old now, and I have been playing AD&D® games for about a year. It may not seem like much, but I have talked to long-time players and we have all had the same experience: We've never played with girls. When I DMed for a group of about six people, I always encouraged them to bring some girls along to the session, but none came. I began to panic and took a decision to go wandering around the streets and asking girls what they think about the AD&D game. Well, the results weren't that good. Of the 70 girls I asked, about 80% looked at me and [The editor apologizes, but he is unable to continue with this letter. It's just too cruel.]

Dear TSR

I have come to write about a question. When Bronson was the DM he brought us into the fucher, and his character Lambirant was shot by a .44 and he said it would only do 1d4 points of damage. Well I said no way. So he is telling me a bullet does the same damage of an arrow. So we both decided to write to you people down at TSR, well we hope you will give us an idil of what a bullet would do. As in hit point wise.

When all of the characters went back into time Dacian who is my character brought 5 guns with him, as in .44, .45, and .357 magnum. So before Dacian goes shooting the guns we wanted to write you.

The best advice I can give you is that it's never too late to get a girlfriend. Ω

THE ECOLOGY OF the Flumph

by Johnathan M. Richards

illustrated by Terry Dykstra

"WELL THEN, if there is no further business," said Dreelix, his gavel raised in the air to strike the table, "I hereby declare this meeting of the Monster Hunters Associa—"

He was cut off in mid-sentence by a commotion in the doorway. Buntleby bustled into the meeting hall, out of breath and with a large, squirming sack tucked under one arm. Ozzie, his osquip familiar, trotted obediently at his feet. "I'm sorry I'm late," he said, "but I was unavoidably detained."

"Late?" squeaked Dreelix. "I was just about to adjourn! You must learn to be a bit more punctual if you wish to continue in this prestigious . . . guh! By the gods! What is that smell?"

Dreelix wasn't the only one to notice. All around the room, the collected wizards and sages that made up the Monster Hunters Association were getting a good whiff of the stench that Buntleby seemed to have brought into the meeting hall with him. Throughout the room, nostrils flared and noses wrinkled in disgust. Lady Ablasta raised a perfumed handkerchief to her nose and pretended not to notice as others administered

table napkins or bits of their own cloaks or robes in an attempt to ward off the vile odor.

"Oh, that. Sorry. I sort of had a little encounter on the way here..." Buntleby reached into his bag and pulled out its contents—a whitish, disk-shaped creature with writhing tentacles on top.

"I don't want to hear about it! Get out of here with that thing!"

"Wait!" said Spontayne, a taciturn scholar who seldom spoke up. "Is that what I think it is?"

"Beats me," said Buntleby. "I haven't the foggiest idea what the thing is. I was hoping maybe Willowquisp could tell us."

Willowquisp the Zoophile, an elderly sage with a fondness for all of nature's creatures—even the silly ones—squinted over at his friend. "Why, bless my soul!" he said. "That looks like a flumph!" Spontayne nodded his head in agreement.

"It attacked one of my osquips," Buntleby said. "I managed to capture it, but not before it squirted some foul-smelling gunk all over me. It seems harmless enough now, but it has some unusual properties, and I thought maybe the Association might want to study it."

"Fine, fine," agreed Dreelix, barely understandable as he spoke with his left hand over his nose and mouth. "I hereby appoint Willowquisp, Spontayne, and Buntleby as a subcommittee to study the creature. Zantoullios, maybe you'd better join them. Any questions? Good. Meeting adjourned!" And without another word, he jumped up from the head table and rushed out the door into the fresh night air.

Zantoullios wasn't the most powerful wizard among the Monster Hunters, but he did have the best-equipped lab, filled with the most modern equipment. He prided himself on being on the cutting edge of magical experimentation technology. Perhaps more truthfully, the reason his paraphernalia was so new was it was constantly being replaced after Zantoullios' experiments blew up in his face. He still hadn't lived down his recent attempt to use a summoned fire elemental to test the flame-resisting properties of a new magical oil. The battered sword he had coated in the oil survived just fine; the lab, converted from an old wooden barn, didn't fare quite as well.

Buntleby arrived at Zantoullios' recently-restored laboratory to find the other three members of the newly-created subcommittee already there. Willowquisp was seated at a table, poring over a large book he had brought with him, with Spontayne the Studious looking over his shoulder and nodding occasionally to himself. Zantoullios was pouring brandy into four beakers.

"Hope you don't mind the glassware, Buntleby; I brought the bottle but left the glasses back at the house."

"That's fine. Why'd you build the lab so far away from the house, though? Seems a bit inconvenient."

"It's, uh, safer that way," Zantoullios admitted. "I've had to rebuild the lab three times now after things . . . kind of got out of hand, but the house has managed to avoid any damage so far. Willowquisp? Spontayne? Some brandy? No? Suit yourselves. So, is that the beast?"

Buntleby took the beaker and placed his sack on the worktable. It shifted and wiggled around as the flumph inside it tried vainly to escape. "Thanks," he said to his host. "So, where should we start?"

Willowquisp cleared his throat. "Spontayne and I have been reading

up on it, and you're right: there are some rather interesting features about the creature. Why don't you start by telling us how you came across it?"

Buntleby sipped his brandy and began his tale. "Well, I had just walked out the door and was on my way to the meeting hall when I heard a squeal from the direction of the osquip pen around back. I dashed to the back and found the flumph perched atop one of my osquips—Squinty—with its tentacles wrapped around his body to hold it in place. I ran forward to pull the thing off, when it spotted me with its eyestalks.¹ It immediately let go of Squinty and rose up into the air. I saw its base swivel slightly,² and before I knew it, I was being sprayed with this liquid that—well, you all got a whiff of it, and that was after it had worn off a bit.³"

"It stunk even worse than Grindle's patented garlic and onion stew!" suggested Zantoullios.

1. A flumph's eyestalks can move independently of one another, giving it a wide field of vision. As the creatures are nocturnal, flumphs have infravision to a range of 60 feet. They have no eyelids and so cannot close their eyes, even during sleep. For this reason, they are seldom surprised in visually-oriented situations. (For example, it would be difficult to walk up to one without it being aware of the approach.) On the other hand, they tend to take more damage from light-based assaults (for example, they save at -2 against *light* spells cast on them to temporarily blind them).

If an eyestalk or tentacle is severed, it takes about a week to grow back. One-eyed flumphs strike at -2 to hit due to a lack of depth perception; those missing a tentacle or two are not impeded and cause full damage with their acid attacks.

2. The flumph hovers by an innate form of anti-gravity, but it maneuvers by means of several small holes along the rim of its disk-shaped body. A mouth-like organ on its top takes in air, which can be expelled by any of the holes along the rim. Air being jetted out the back of the flumph's body propels it forward; air jetted from the creature's left sends it to the right, and so on.

The air jets propel the creature horizontally, while it moves vertically at will by means of its anti-gravity ability. Its tentacles are used like rudders, enabling the creature to spin clockwise or counter-clockwise, depending on the placement of the tentacles as it forces air out one of its rim holes. This is important in lining up its defensive spray, as the liquid can be expelled from only one of the eight rim holes. This one rim hole is usually referred to as the creature's "front" (a somewhat arbitrary position on a radially-symmetrical creature).

"Anyway," continued Buntleby, "there was a butterfly net at the side of the house, so I grabbed it up thinking to capture the creature for study. Meanwhile, Squinty was running around in a panic at my feet, and in all of the confusion, I sort of..." He winced in memory of the event, and stopped talking.

"Tripped over him?" guessed Willowquisp.

"Stepped on him, actually," admitted Buntleby. "On his head."

"Oof!" said Willowquisp. "Is he okay?"

Buntleby grimaced. "He bit his tongue."

"That's not so bad," pointed out Spontayne.

"Off," added Buntleby. "You know what their teeth are like?"

"Poor thing."

"Getting back to the flumph..." suggested Willowquisp.

"Oh, right. Well, stepping on Squinty put my swing a little off. I twisted my ankle and went plummeting to the ground, but on the way down I gave the net a wild swing at the flumph. I hit him on one side, but as it turned out this was a lucky break, because instead of catching him in the net I flipped the creature over in mid-air, and it crashed to the ground on its back. It seems to be helpless when its upside-down."⁴

3. A flumph's defensive spray squirts out in a 60° arc from its "front," with a range of 20 feet. The liquid is extremely foul-smelling, something of an unappealing melange of skunk musk, rotting cabbages, and the unwashed armpits of a sweaty, overweight orc. The stench causes those struck to save vs. poison or be unable to attack for 2-5 rounds due to extreme nausea and dizziness. The odor from this attack lasts for up to 4 hours and is detectable from 100 feet away. (This scent could easily attract wandering monsters.) The flumph's spray attack also propels it in the opposite direction, since the attack emanates from one of its rim holes. A flumph can use its spray only once every ten rounds.

4. A flumph is virtually helpless when placed on its back, even more so than a turtle. The creature's innate anti-gravity is aimed downward from the creature's lower side, making it useless if the flumph is flipped over. Its many tentacles are capable of delicate maneuvering but do not possess much strength, so the flumph is unable to flip itself over by grasping at nearby handholds. Furthermore, its "maneuvering jets" cannot be employed unless it is levitating, and this includes the one responsible for its defensive spray. To add insult to injury, its long eyestalks are pinned by its body when overturned, so the creature cannot even get a good look at what is going on around it.

5. Although the flumph's "mouth" is on its upper surface, it is used for air intake only. The creature actually feeds by means of several small spikes located centrally on its underside, surrounded by its tentacles. The flumph drops down on its prey (mostly frogs, lizards, and small rodents), piercing the victim's body with the spikes for 1d8 hp damage. It then introduces acid

"Yes, that's mentioned in my book," noted Willowquisp. "So then what?"

"Well, I fixed Squinty up as best as I could—poured a *potion of healing* down his throat, you know, the cherry-flavored kind he likes. His back was scarred from the flumph's attack,⁵ but the potion healed him up okay. So I threw the flumph into an old potato sack and raced to make it to the meeting in time. I guess that's about it."

"So what prompted you to bring the creature to the Association for study?" asked Willowquisp.

"Well, I figured there's got to be something we can make out of it. Zantoullios?"

"Well, you've got our procedures backward: usually, we come across a formula for a new spell or a magical item, find out what strange body parts we need, and then plan a Hunt accordingly."

But still, we'll see what we can come up with. Hmm, hovering: *potions of levitation*, perhaps, or spell components for *levitate*, or possibly reverse *gravity* spells..." he muttered to himself, his mind already examining the possibilities. "Acid secretions: tentacles might be useful in *oil of acid resistance*, possibly tie it in somehow with a *Melf's acid* arrow spell? Maybe. Smelly squirting liquid: *stinking cloud* spell components, perhaps . . . I'll have to check my formulae."⁶ He

into the wounds by means of its tentacles. Each tentacle is hollow, much like an elephant's trunk, and is highly flexible. While some tentacles entwine around the prey in an effort to hold it still, others secrete acid, causing an additional 1d4 hp damage for the next 2d4 rounds. The acid is produced in the flumph's lower body cavity; anyone piercing a flumph's underside (AC 8) from below is hit with a shower of acid causing damage as noted above. The acid is highly potent, requiring active washing with 2-8 gallons of water or immersion in a swiftly-moving stream in order to remove it completely; simple immersion is not enough.

Once the prey is dead and the acid has had enough time to liquefy the creature partially, the flumph sucks up nutrients through its tentacles. In this respect it is similar to most spiders, whose venom liquefies the insides of its captured prey, allowing the spider to "drink" its victims.

6. The brain of a flumph—a small organ located just under the creature's upper shell, midway between its mouth and its rear rim hole—when pulverized, produces a liquid useful in the production of *potions of levitation*. One flumph brain provides enough liquid for three such potions.

The inner layer of hollow flumph tentacles can be removed and used as one of the ingredients for *oil of acid resistance*. It takes about 20 tentacles for one application of this magical oil.

The gland that stores the flumph's defensive spray can be used as an alternate material component for the *stinking cloud* spell. If used for this purpose, any flumphs within one mile of the spells effect have a 50% chance of investigating the *stinking cloud*.

busied himself in the back of the lab, digging through a pile of disorganized notes and books filled with his tiny scrawlings.

Buntleby pulled the flumph out of the sack and looked at it in the light of the laboratory, careful to keep it upside-down. It was entirely white, from the eyestalks to the tentacles. Even its short little spikes were a whitish-gray, although there were specks of dried blood staining a good number of them. Its eyes were a dark blue, almost black, and it looked at Buntleby with an unfathomable expression. Was it angry at its captivity? Curious? Frightened? Buntleby had no way to know.

"Look how long the eyestalks are," said Buntleby, holding up the flumph for his companions to see. "I wonder why they're so long?"

"By necessity, no doubt," suggested Willowquisp, looking up from his tome. "If it spends its life in the air and drops down on its prey, it would have to be able to see past its own body."

"Makes sense," admitted Buntleby. On a whim, he placed the inverted flumph on his own head, and held its eyestalks together under his chin. "Here we go," he said, "A new hat for Lady Ablasta." Tilting his head back so he could look down his nose at his companions, he scrunched his face into a lemon-sucking configuration and did his best Lady Ablasta imitation. "I'm sure you young

men cannot *possibly* appreciate just how *proper* and *fashionable* my new headgear is. But of course, such is to be expected of the *uncouth* members of today's society."

Willowquisp chuckled and held out his hand, and Buntleby passed the flumph over to him, careful to keep it upside-down. Willowquisp tested the sharpness of the creature's spikes with his finger, and offered, "There are times I'd be sorely tempted to place

this little fellow, as is, on Dreelix's chair."

"That would be a sight!" agreed Buntleby, placing the flumph down on a chair and wagging his butt over it as if about to sit. Even Spontayne, normally slow to join in any jocularity, allowed a grin to cross his face as he pictured Dreelix sitting on a flumph.

Buntleby picked the creature back up, then examined its shell. "Hey, feel how hard the top is, compared to the bottom,"⁷ he said.

Spontayne gave a rap on the creature's top, then poked a finger into its squishy, pliant underside. The flumph responded with a squeaky "wheel!" of exhaled air, as if ticklish. "Almost like a turtle's shell," he said. "Odd that they can fly with so much weight on top."

"No, really, its not that heavy at all. Here, feel for yourself." Buntleby passed the creature over to his mentor.

"Amazingly light," agreed Spontayne.

"Perhaps the shell could be used in the construction of lightweight armor of some type."

"Possibly. Or maybe a buckler, or something." He took the creature back from Spontayne and carried it over to Zantoulios, who was buried in a pile of arcane formulae and research notes, many of which had spilled out onto the floor. "Hey, take a peek at this texture. Think we could fashion some sort of armor from this?"

Zantoulios spun around at the sound of Buntleby's voice. His oversized book of notes bumped the flumph out of Buntleby's hands, and the creature spilled onto the floor. At the same time Buntleby's foot slid on a loose scrap of paper, one of Zantoulios' escaped notes that now littered the floor of his lab. He went crashing to the floor, jarring his funny bone in the process.

The flumph landed on its edge and began spinning across the floor like a runaway wheel. Zantoulios made a grab for it but slipped himself and landed hard on his face, shooting a stack of notes detailing the marvelous new uses he'd found for troglodyte bladders flying out behind him.

"Stop it!" Buntleby yelled, crawling to his feet. "Don't let it get away!"

Willowquisp and Spontayne looked up from the thick zoological tome Willowquisp had brought, to see the flumph barreling across the floor at them in a bee-line, tentacles splayed out on one side and eyestalks splayed out on the other. It hit Spontayne's foot and tipped over, wobbling in a

small circle along its circumference like a dropped coin between the two men.

"Look out!" yelled Zantoulios. "It's flipped up! Grab it, quick!"

Willowquisp bent over to grab the flumph. Spontayne did the same, and the sound of their heads colliding could be heard clear across the lab. Both staggered backward, and the flumph shot up into the air between them.

In an instant, the flumph reached a height of ten feet, well out of the range of the four humans below, where it teetered drunkenly and attempted to regain its balance. Spontayne staggered over and slammed the shutters closed on the lab window, preventing its escape. "Now what?" he asked.

"Got that butterfly net with you?" asked Zantoulios. Buntleby shook his head. "What about spells?"

Buntleby took a quick mental survey. "Nothing of use," he admitted. "You?"

"Sadly, no. Wait a minute, though, I've got an idea." He disappeared into a back room.

The flumph circled around the room slowly, eyestalks waving back and forth as it looked for a way out. It had apparently regained its equilibrium and

7. A flumph's upper surface is AC 0. During the daylight hours, the creature often flies up into a tree and settles on a sturdy branch, wrapping its tentacles around the branch for support. This leaves its hard upper shell exposed while protecting its softer underside while it sleeps. The eyestalks are retractable and can be whipped into the creature's body quickly if necessary, but the flumph usually keeps them out and facing opposite directions while sleeping. Flumph sleep is very light, and the creature remains somewhat aware of its surroundings at all times. If danger is

present, it can snap awake in an instant, although it does suffer a -2 penalty to its surprise roll if attacked while sleeping.

8. This noise is just incidental to the flumph's movement through the air and does not constitute a language. There is a flumph language, but it is a sign language based on tentacle and eyestalk movements, difficult for non-flumphs to learn and impossible for them to reproduce (short of using *polymorph* magic to take on the shape of a flumph themselves, or creating the illusion of a flumph and using it to do the "talking").

9. Flumphs have no regular feeding schedule. They almost always attack rodents on sight, regardless of how recently they have fed, leading some to believe that flumphs prefer a rodent diet, or that they were specifically bred as a farming aid to cut down on the rodent population. They will also eat small creatures such as lizards, frogs, and snakes, but given a choice will always go after rodents first. A flumph sees killing rats and mice as a sacred duty to be performed whenever possible.

scooted about along a horizontal plane well out of reach of the humans below. The three Monster Hunters could hear a low whistling as air passed through its maneuvering jets.⁸ It glided aerially along one wall, did a quick pirouette, and floated along the next wall, eyestalks in constant motion. Suddenly, its eyes did a double-take, and in a burst of speed it maneuvered over to the far corner of the lab.

A sudden thought struck Buntleby. "Where's Ozzie?" he cried.

The flumph positioned itself over the osquip, making final adjustments as it aligned itself above its unwitting prey. "No!" screamed Buntleby as he leapt across the room toward his familiar?⁹

The two reached Ozzie at about the same moment. Buntleby curled protectively over his familiar, and the flumph ended up landing on Buntleby's shoulder. He felt a brief prick of pain as several of the creature's spikes penetrated the layers of his robe, but then the flumph, surprised by the loss of its prey, zoomed back up into the air.

It didn't get far. Zantoulios, brandishing a *staff of striking* he'd been meaning to recharge, gave a blood-curdling scream as he charged across the room and smacked the creature between the eyestalks. The flumph teetered and tottered in the air, wobbling crazily as it tried to regain its balance. Not surprisingly, it let loose with its defensive spray, catching Buntleby, Zantoulios, and Ozzie in their faces.

Zantoulios dropped his staff, recoiling in disgust.

Spontayne made a grab for a wand on the worktable and tossed it over to Zantoulios. The gangly wizard caught it, spoke a command word, and the air became more breathable at once. The slim black wand had an inflatable bag at one end. As the bag filled with air, the stench became less and less noticeable. "Troglydye bladder. Good thinking Spontayne." Spontayne merely grunted his agreement and went over to check on Buntleby. Zantoulios picked up his staff and looked up at the flumph, hovering just out of reach.

"So now what do we do?" asked Willowquisp.

There was a loud bang at the shuttered window. All eyes turned toward it, including those of the flumph.¹⁰ The shutters buckled once, twice, and then crashed open. To the Monster Hunters' amazement, a hammer-shaped field of energy floated into the room, followed by a pair of flumphs.

These flumphs were different-greenish-yellow, with tentacles shaded dark green. There seemed to be a considerably greater number of tentacles present on the green flumphs, and they waved about constantly.¹¹

The white flumph hovered up to the newcomers and performed an intricate series of movements with its tentacles and eyestalks, one tentacle

pointed accusingly in Buntleby's direction. The green ones positioned themselves between the white flumph and the startled humans below.

Spontayne was bent over Buntleby, both caught staring up at the strange creatures hovering above them. Willowquisp the Zoophile held his large tome up like a shield as if to ward off any evil spells the things might hurl at him. Zantoulios stood with an enlarged troglodyte bladder on a stick in one hand and a staff in the other, ready to strike. Under the creatures' gaze, he lowered the staff to the floor and gave a sickly chuckle, his oversized Adam's-apple following his nervous gulps down his throat.

Buntleby felt a gathering of magical energy about him, and found that he was unable to move. From the corner of his eye he saw the others were immobile as well, and from the look of puzzlement on Willowquisp's face he figured the sage had never been in the grip of a *hold person* spell before.¹²

One of the green flumphs sucked in a large breath of air from its dorsal mouth-organ and forced a few words out of one of its rim holes.¹³ "Not evil,"

it squeaked, evidently revealing the results of a quick detect evil spell.

The *spiritual hammer* winked out of existence behind it. "Explain behavior."

Suddenly, Buntleby could move again—apparently, he had been released from the spell.

He looked at his companions, but they remained immobilized. It seemed that he was to be their spokesman.

10. Although flumphs have no external ears, they do have a sense of hearing on a par with that of a human. They do, in fact, have four inner ears spaced equidistant around their bodies just below their maneuvering jets. They have an excellent sense of touch in the tips of their tentacles but a weak sense of smell (based on the mouth-like organ on their upper surface) and no sense of taste.

Their sense of smell is somewhat unique in its extreme sensitivity to one particular scent—the odor of their own defensive spray. A flumph is able to pick up that one scent from over a mile away. This means when a flumph uses its spray, it is also alerting all other flumphs in the immediate vicinity that a dangerous situation has arisen. Being lawful good creatures, any flumph picking up the defensive odor heads toward the scent to assist if it can.

11. Monastic flumphs are a higher order of flumph, able to cast priest spells as if they were clerics of equal level to their hit dice. At 2-5 HD, this gives them access to priest spells of first to third level. These spells are modified versions of the spells known to PCs, requiring only somatic gestures, which they perform with consummate skill with their numerous tentacles. Monastic

flumphs have a larger number of tentacles than do common flumphs; while this enables them to cast spells, it also leaves less room on their undersides for spikes, and as a result monastic flumphs cause only 1d6 hp damage instead of the common flumph's 1d8.

Little is known about the mysterious monastic flumphs. They gather together in large caverns to worship unknown, lawful good deities. Each monastic flumph society is called a "cloister," led by a 5-HD "abbot," 3- or 4-HD "priors" (one per six flumphs in the cloister), and a handful of 2-HD "monks." Cloisters commonly hold up to 32 individual monastic flumphs, who act as guardians for the common flumphs and pursue their own mysterious interests.

Most of what little is known of the monastic flumphs was documented by one Cartificant the Learned, a curious sage with a penchant for unusual field-work. It was he who gave the monastic flumphs their religious-based titles, and since so little has been written about the creatures, the terms "cloister," "abbot," "prior," and "monk" have become common usage in describing monastic flumph society.

Had Cartificant finished his field-work with the monastic flumphs (tragically, he was killed in a

rare butter-churning accident), he might have learned the true relationship between ordinary flumphs and the monastic variety. Monastic flumphs are not a higher order of flumph so much as "normal" flumphs are a lower order of monastic flumph—specifically, their idiot mutant children. About 10% of monastic flumph buds grow into albino flumphs. While these creatures are lower in intelligence and cannot cast spells, they are nonetheless cherished and looked after by the lawful good monastic flumphs. The albinos always breed true, so over time, the "normal" flumphs came to far outnumber the monastic ones.

12. Since monastic flumphs cast their spells using only somatic gestures with their many tentacles and also move their tentacles when communicating with others of their species, there is usually no warning for an outside observer that a monastic flumph is casting a spell.

13. A very few monastic flumphs (about 10%) have mastered the Common tongue or another verbal language. They do not speak often, and when they do it is in short bursts of words as they force air out of their rim holes. A speaking monastic flumph sounds like it just took in a lungful of helium and is trying to do a Mickey Mouse impression.

"Why fight?" asked the green flumph in its high-pitched voice.

"We were, uh, defending ourselves," he began.

The green flumph that had spoken pointed at the white flumph with a thin tentacle. "Why attack?" it demanded in its squeaky voice.

"Well, he started it! He attacked one of my osquips!"

The flumph swung its eyestalks to stare down at Ozzie. "Kill vermin."

"Ozzie's not vermin! He's my familiar and my friend!" As if understanding the flumphs' motives, Ozzie prudently scooted behind Buntleby's feet and hid from the hovering creatures.

The flumph swung its eyes back to Buntleby. "Not vermin?" it asked, surprised.

"Definitely not!"

"Not vermin?" it asked again. The green flumph pointed his two eyeballs at each other in confusion, then seemed to give a mental shrug. It pointed a tentacle at its white-skinned cousin, and said, "Not hat."

Buntleby felt his cheeks burn crimson as embarrassment crept over his face. "Yes, well, I'm sorry about that," he mumbled.

"Not cushion. No sit."

Buntleby's face grew even redder.

"Look, I think there's been a terrible misunderstanding on both our parts. I apologize for the way we've treated your friend here, and I see now that no harm was meant on your part toward my osquips, too. How about we just admit to our misunderstandings and each go our own separate ways?"

The flumphs stared at the Monster Hunters for a few seconds, then turned and waggled tentacles at each other. "Agreed," said the flumph spokesman. With a puff of air, it swiveled around on its central axis and jetted out the window, the other two creatures following behind it.

Movement returned to the other Monster Hunters. "Well I'll be," remarked Zantoulios. "I think we were just scolded. What were those things, his parents?"

"Unlikely," Willowquisp replied, flipping through his book once again. "Flumphs have but a single parent—they reproduce asexually by budding, once every two years or so. No, I believe they were a different type of flumph altogether. My tome here hints at a race of spellcasting flumphs, and I think that's what we just saw."

"So the little white guy just got rescued by two of his more powerful cousins," remarked Buntleby, bending down to his familiar and stroking him behind the ears.

"And I'd say we were lucky at that," said Willowquisp, flipping quickly through his book in search of a particular page.

"We got off easy in only having to deal with a spell-using flumph; we could have been facing one of these, instead!"

Finding the page he was after, he flipped the book around so his friends could see.

The picture showed a creature that looked like nothing so much as a giant brain, from which grew a parrot-like beak and ten long tentacles. From the way it was drawn on the page, it was obvious that the creature was hovering in mid-air.

Another creature believed to be related to the flumph is the belabra, or "tangler." Somewhat more primitive than either the flumph or the grell, the jellyfish-shaped creature cannot levitate or fly, but instead glides after a springing leap that can take it 60 yards at a time. The creature has 12 rubbery tentacles, a hard, bony upper shell, and four dorsal eyestalks. Further evidence of flumph ancestry is the fact that when a tentacle is severed, the creature sprays its blood at enemies, which has a debilitating effect on them. Belabra also reproduce through budding, as do flumphs. Many sages believe the belabra to be a precursor to both the flumph and grell species. Further information on belabra can be found in MC3: *FORGOTTEN REALMS® Appendix*, under "Belabra (Tangler)."

"A grell?" asked Buntleby. "I've never heard of them."¹⁴

"You're lucky never to have met one," said Zantoulios. "I don't think we'd have got off so easy if it was a couple of grell that burst in here."

There was silence for awhile, as each Monster Hunter reflected on what had just occurred. Finally, Zantoulios broke the silence.

"Actually, I'd prefer explaining to the Association that we lost our flumph to a daring raid by a couple of

nasty grell, rather than admit that the four of us were bested by a little green.

flumph," he said with a squeaky voice.

"Good point," admitted Buntleby, rubbing his sore shoulder.

"I think," suggested Willowquisp, "that after much investigation, we decided that flumphs are unsuitable for magical experimentation, and we let him go free."

"I like it," said Spontayne.

"Me too," agreed Buntleby.

"Good plan," said Zantoulios.

Johnathan M. Richards says he is very familiar with the concept of the nausea-inducing smell, since he grew up living across from a mushroom farm that brought in compost daily by the truckload, and currently lives downwind from a meat-rendering facility.

14. No grell would ever come to a flumph's rescue, although it is very possible that the flumph and the grell are genetically related. Sages point out the many similarities between the two creatures: both hover in the air by means of an innate ability; both have numerous tentacles; both drop down on prey from above; both are nomadic, seldom staying in one area for long. In addition, each has a solitary type (the common flumph and the rogue grell) as well as a "colony" type (the monastic flumph and the colonial grell). Further information on grell is available in the *MONSTROUS MANUAL®* tome (under "Grell"), *MC5 GREYHAWK® Adventures Appendix* (under "Grell"), and *MC9: SPELLJAMMER® Appendix* (under "Grell, Colonial").

The Ecology of the *Galeb Duhr*

An AD&D[®] game monster that gives new meaning
to the term “rock & roll”

by Robert Isaacson

Artwork by Jim Holloway

As recorded in Goldenfire, the third volume of the collected journals of the ranger Leira Silvershadow:

Thus it came to pass, in the early autumn of that year, that the decade-long feud between the dwarves of the Thunderbarrel Clan and the Skull Smasher and Blood Licker goblin tribes was at last resolved. The decisive battle that found the noble dwarves victorious took place during the siege of the ancient dwarven bastion of Yrensparthe. Having had the dubious honor of being present there during the final days of the fight, I can remember all too clearly the horrific allies the goblins called upon in their efforts to overwhelm the fortress: orcish and ogriish warriors, gnoll archers, a band of berserk trolls, and others even more diverse and deadly. While the greatest allies the dwarves possessed were their courage and tenacity, neither were they alone in their long struggle. Indeed, some of the dwarves' greatest aid came from entities the goblins never even saw. "A trick that is known is good; a trick that is unknown, doubly so," is a saying of the elves, and I can readily attest to its truth. For it was in the foothills leading to the besieged Yrensparthe that a young messenger and I had an encounter of note.

I had been hired by the dwarves, at the recommendation of my friend, Wilsar Thunderbarrel, to aid messengers and runners in their return to Yrensparthe. Ordinarily the dwarves would have had no difficulty in getting back on their own; circumstances, however, were not ordinary. The large number of goblin patrols and spies in the area precluded the use of many of the outlying secret entrances to the keep, lest they be discovered and thus bring attack from within on the beleaguered defenders. In addition, as every available stalwart was needed to hold his place on the walls, many of the older and more experienced scouts were involved in planning and orchestrating the defense. Only the younger runners, unused to battle and of little practical worth on the ramparts, could be spared for the exchange of information with the few spies the dwarves had emplaced in secret outposts in the hills. As they mostly carried news of the minor shifts the goblin hordes made from one clearing to another, the lads I was charged with guiding and protecting only rarely had news worthy of even the slightest attention of their commanders. I usually had no trouble sneaking them through the goblin lines, whose sentries were looking out for dwarvish raiding parties, not messengers. I therefore expected that bringing young Slekk Aldenroy back to Yrensparthe would not pose much difficulty.

When I got to the outpost where Slekk was supposed to be awaiting me, it was empty. The flurry of tracks around the area indicated to me that the hidden station had almost been discovered by a group of goblins on patrol. The shambles

Slekk had left behind indicated that he had departed in considerable haste. The tracks he had left were clear enough for a kobold to follow; I set off immediately, and before long had caught up with the lad.

I found him sitting half-conscious in a small glade. He was young as dwarf runners go, having not even five years' growth of beard and a dazed and frightened look in his eyes. His only armament was a blood-streaked woodsman's axe, and his left leg had been struck by a gnoll's arrow. The corpses of a pair of gnoll archers lay sprawled nearby.

Slekk was dazed with pain and weak with blood loss. I removed the arrow and applied a hasty field dressing to the wound. As I did so, I questioned him about what had happened. He was able to give me some half-coherent explanations, and a swift examination of the surrounding area told the rest. He had indeed discovered some vital information; he had observed the beginnings of a gathering of a huge force, all the remaining hordes in the area, to be hurled against the unsuspecting dwarves in three days time. After the near-discovery of his hidden refuge, he had decided that he could wait no more, lest the knowledge he carried be lost. Unwise in the ways of the woods, however, he had not been traveling long before he bumped into the now-deceased gnolls. I hid the corpses as best I could while trying to get some details from him on the goblins' imminent offensive, but the lad had slipped into a daze and I got nothing more out of him.

I feared it would not be long before the gnolls' bodies were discovered, so I got Slekk to his feet and we set off as swiftly as we could. It was not long before we heard an alarm horn in the distance. Before another hour had passed, we could hear the sounds of pursuit. Had I been alone, there should have been no difficulties. But my charge was both wounded and unskilled in woods lore, and the goblins steadily gained on us. By the time we reached Truman's Pass, a rough and steep trail leading up the side of Raven's Ravine to a dwarf-sentried blockhouse some distance away, they were almost at our heels.

There was no choice but to continue running for it. I knew we had scant hope of outrunning them; the pass, extending the length of the ravine, offered little concealment, being nothing but a rough path with a few scattered boulders and patches of scree. But my only alternative was to abandon a wounded runner to the goblins, and with him abandon all hope that the besieged dwarves could hold against the coming attack. We started up.

The goblins howled as they caught sight of us, surging forward up the trail in a pack. Lacking proper bows or slings, they hurled stones and inventive curses after us. The clamorous sounds of their pursuit bounced and echoed off the steep walls around us, and their foul battle-cries rang

in our ears as they drew steadily closer.

Then there was another sound, more thunderous and deafening than the goblins that pursued us. The path trembled as a sudden avalanche of soil, loose rock, and debris plowed into the horde pursuing us, sweeping many of the screaming pack into the ravine. The remaining force wavered, daunted by the sudden catastrophe. The incident bought us needed time, and we did not waste it, continuing our flight.

Our pursuers paused only momentarily, though, then set after us with cries of renewed fury. Young Slekk slipped further into unconsciousness, and I was obliged to half-carry him up the trail. Our pace was growing steadily slower, and the goblins behind us screeched in joyous anticipation of the kill. We passed under one of the large outcroppings of rock with which Truman's Pass is dotted. I scanned the jutting formation and surrounding cliff face for some small trigger, knowing that one might well have been placed by the dwarves to activate a trap or open a secret door, but my search was futile; there was nothing, and the horde behind us rapidly closed the distance. Once past the rocks, my legs finally gave out. I could run no more. I set Slekk down and unslung my longbow, vainly hoping that my elf-wrought arrows could persuade them to abandon the chase. I felled only one, and then they were sweeping beneath the outcropping toward us.

Suddenly, to my utter astonishment, the outcropping changed. It grew darker and glistened with sudden moisture. An instant later, it melted and collapsed upon the goblins, no longer stone but thousands of pounds of mud. A dozen goblins screamed as the sudden mudslide engulfed them and carried them over the edge into the ravine. Again, I did not question the unexpected miracle, but got Slekk to his feet and got moving again. The blockhouse was growing steadily closer, and I hoped that the goblins would decide that their losses were too great to continue.

Alas, no one has ever credited goblins with abundant wisdom, though they know something of tenacity; this second disaster only served to incense the remaining handful. They raced after us, shrieking promises of revenge for their lost companions. The blockhouse seemed close, incredibly so, but the one gate lay on the other side of the structure. I knew it to be much too far for the half-dozen dwarves within to aid us. Hurling stones and knives bounced around us as we stumbled up the last rise.

A sudden grating sound met our ears. As we topped the rise, I turned to see a barrier of stone shoot up out of the ground, sealing the path behind the goblins. A split second later, a new rumbling sounded—*ahead of me!*—and another wall appeared across the path before us. As we reached this wall, a section melted back, opening a hole large enough for a man to pass through. I had no time to wonder at our

salvation; I quickly lifted Sleik and stepped through the opening. As I turned to look back, I could see that the hole was already closing on itself, leaving the goblins boxed in. Before the opening vanished completely, however, I caught a glimpse of the goblins panicking. The very boulders along the path seemed to be stirring, as though life had suddenly been breathed into them. Then the hole was closed, and I could see no more. But I heard the goblins' terrified cries. I carried Sleik to the gate, where the dwarves within quickly admitted us.

"We'll see to this young one," the sergeant assured me, after I explained the information Sleik carried. "So you led those blackguards on quite a chase, eh?"

"Not entirely my doing," I gasped, my heart still pounding in my chest. "There was wizardry at work out there. Walls of stone, seas of mud—"

The sergeant laughed. "Not wizardry. Just the doings of those who know the stone even better than we. It's thanks to them that we require only a company of six in this post; they see to it that no unwelcome trespassers make it here. They've been watching you since you started up the pass. They're just outside. Would you care to meet them?"

We stepped back outside. There was no sound now from the goblins trapped inside the stone walls. "Dead," the sergeant said. "Probably ground to blood and powder by now. Well, here we are. You can thank them yourself."

I looked around, but could see nothing except the wall of the ravine, a struggling mountain pine, a pair of very large boulders, and some scrub. "Where?" I asked.

The sergeant smiled again and pointed at the boulders. "There," he replied. As I watched amazed, one of the boulders shifted. A rocky brow lifted, revealing a stony black eye. Both stones began to stir, rising up and standing on short, thick legs. Their eyes opened as they hefted themselves up, and their cavernous mouths stretched into a pair of mischievous grins.

Thus was my first encounter with a most rare and fascinating creature, the galeb duhr. During ensuing conversations, both with Yrensparthe's resident sage, Jarek Thunderbarrel, and with the galeb duhr themselves, I have discovered much of the so-called "stone men of the mountains." There is much to wonder about when one considers the lives of beings that are living rocks. How does a galeb duhr eat? What kinds of rigors can they withstand, given their rocky forms? How do they reproduce? What laws do they follow, if any? How long do they ordinarily live? What gives them their legendary powers over stone? Over a course of months, I learned the answers to these questions. Herein do I set down my findings, that I may rectify some misconceptions and enrich the general knowledge about these amazing entities.

Galeb duhr are monolithic in appear-

ance, for these beings are formed entirely of stone. They look like huge boulders or outcroppings of rock, with stony human-like features positioned on the broadest face. They have two limbs, which act as both arms and legs. A galeb duhr walks with a slow, ponderously steady gait, the digits of its appendages gripping the ground surely. A galeb duhr cannot walk while holding something in its "hands," though the digits are capable of fairly delicate manipulation. A galeb duhr that is dormant or wishes to remain hidden can merely close its eyes and mouth, draw its appendages close to its body, and sit still; in such a state, it cannot be distinguished from a normal boulder.

A common thread running through the popular stories told of the galeb duhr is the idea that they eat rocks, an understandable though incorrect conception. More accurate would it be to say that they **draw sustenance** from rocks, for a galeb duhr does not eat, at least not as we understand eating. As far as I was able to tell, they also neither sleep nor breathe.¹ Instead, they gain nourishment simply from continual contact with their stony surroundings. Galeb duhr take their sustenance from the earth much the same way a plant grows in the sunlight; the more sunlight, the stronger and healthier the plant. In the same manner, a galeb duhr is strongest and healthiest in areas that are predominantly stony in nature. A galeb duhr lives out its life in a mountainous environment; they are almost never encountered elsewhere, for good reason: loss of contact with the natural mountainous environment progressively weakens a galeb duhr, and it will die if kept from areas of stone for too long a time, much as a plant will die without sunlight.² Galeb duhr are often found in underground caverns as well, though they are rarely recognized there in the jumble of rock.

In conversation with the galeb duhr near Raven's Ravine (which was a prolonged business, as galeb duhr rival treants for slowness of speech), I frequently heard references to a thing they called "earth power." When I asked them to describe it, they could only say that they felt "a feeling of strength in places with the earth power." In further discussion, Jarek Thunderbarrel gave me his theory of earth power, which went as follows:

The galeb duhr are very strongly connected to the elemental plane of Earth. This link is unconscious for the most part, and it exists in each of them. Since they are so well attuned to that plane, they are able to consume the rocks themselves and magically control stones without the use of spell-casting, as we understand it. Earth power is simply a measure of a place's "connection" to the plane of Earth; places of strong earth power include mountain ranges, deep caverns, or rocky lands prone to severe earthquakes. Galeb duhr greatly prefer such places, for away from them their endurance and powers wane.

All mountains contain the "earth power" to some extent, though some less so than others. Generally, the younger and less eroded by air or water the rocky surroundings are, the stronger the elemental link that such a place possesses. In very new mountains or places where the natural elemental link has been heightened, such as by magical alteration, a galeb duhr's power is said to become greater still. Tales tell of whole colonies of stone men dwelling there, and only the foolish would contest their power.

From this and other dissertations, I gathered that while a galeb duhr's powers over the rocky environment of its home are similar in form to known earth- and stone-affecting spells, such powers may be activated with but a moment's thought (a warning to wily mages who might think to best these creatures at their own game!). It is also my understanding that very old galeb duhr or those dwelling in highly magical areas are stronger than ordinary galeb duhr, and may command additional powers.³

Galeb duhr are naturally resistant to certain extremes. Fire does little harm to them, for it takes a great deal of heat to harm stone. Magical fires, which have such intense heat, are more dangerous to these beings. Galeb duhr easily shrug off electrical attack, being nonconductive, and they are completely immune to any and all poisons. However, all stonemasons know that there is nothing like cold to bring out cracks or faults in stone. Intense cold does considerable harm to galeb duhr, and they are often dormant during wintertime, though Jarek told me that this may not be the case in areas of strong earth power.⁴ (Caverns at least afford protection from the winter's chill.) Wizards knowledgeable in elemental matters have discovered that certain spells affecting rock will also harm a galeb duhr, though details on these effects are not clearly known.⁵

I am at a loss to converse about the exact interior biology of a galeb duhr. I broached the subject with the galeb duhr at Raven's Ravine but was able to learn little; they seemed surprised at such a question. However, I spoke with one dwarf veteran who had witnessed a battle between two galeb duhr and a marauding young dragon, in which one of the galeb duhr was killed. The galeb duhr was struck a mighty blow by the dragon's tail and broke apart like a rock struck by a sledgehammer. When the dwarf visited the aftermath of the battle, the fragments were almost indistinguishable from the ordinary scree of the area.⁶ From this, I gather that galeb duhr have no interior organs at all, being literally solid stone throughout. How such beings can move and think as ordinary creatures do is beyond my understanding. I postulate that their ties to the plane of Earth allow animating elemental forces to flow directly into them; Jarek is supportive of this theory but refuses to commit himself profes-

sionally until proof can be obtained.

Galeb duhr are very territorial creatures. Once they have settled into an area, it is nearly impossible to move them. A galeb duhr usually spends much of its time either sitting in one place, watching and thinking, or slowly patrolling its environs for signs of disturbance. A galeb duhr's territory usually encompasses an area of about 1-4 square miles. It is invariably protective of its mountain home, vigorously defending it as its own against uninvited or hostile intruders. It will often ally itself with those of like mind against potential despoilers; in wooded mountain ranges, galeb duhr and treants often work together, and alliances between galeb duhr and near-surface bands of pech are not unheard of. A galeb duhr is intimately familiar with the lay of the land in its territory and will usually have traps set in various areas of access (paths, natural ascents, etc.). Such traps are usually features of the landscape, either natural or created by the galeb duhr, that can be triggered by one of the galeb duhr's earth-affecting powers; the outcropping at Truman's Pass that changed to mud was one of these.

A galeb duhr will typically watch invaders for some time, determining if they are of violent intent or not. Peaceful travelers are allowed to pass unmolested. Should the intruders be deemed hostile, the galeb duhr will attack from hiding, using its powers to harry and waylay the intruders (note that "hiding" to a galeb duhr often means simply closing its eyes and mouth and sitting still). If a galeb duhr cannot persuade invaders to leave its territory in this way, it attacks openly, usually in a steep or narrow area so its foes cannot retaliate easily. In combat, a galeb duhr animates normal boulders and rocks around it and commands them to attack; this action is similar to the way a treant animates trees. Earth-affecting powers will be used in the most effective way possible: **walls of stone** may be raised and collapsed on intruders, earthen embankments may be moved to hinder movement or cause an avalanche, and so forth. If any foes come within striking distance, the galeb duhr will attack physically with a crushing bite or a smashing blow from one of its appendages.

Galeb duhr social structure is practically nonexistent. They have no castes or classes, leaders or followers. They are, for the most part, solitary creatures, each of whom will stake out and watch over its own mountain territory. Occasionally, a number of galeb duhr will dwell in the same area, as do those at Raven's Ravine, but this is unusual. I know nothing of their religion, if any such exists; the galeb duhr of Raven's Ravine showed little interest in the subject, but they may not have understood my questions on the topic.

Galeb duhr are extremely long-lived; an average specimen could live to be many thousands of years old. They do not mate; indeed, they have no genders at all. When a galeb duhr dies naturally (that is to say,

not from combat or the loss of contact with its earth power), it slowly cracks and crumbles away over a period of 2-7 days. At the end of this time, all that remains of the original galeb duhr is stone dust, gravel, and three large chunks of stone. These chunks of stone are young galeb duhr. They remain immobile for a period of approximately one century, slowly growing and developing, during which time they are completely indistinguishable from normal rocks. At the end of this time, they awaken as adult galeb duhr. The largest then usually takes control of the surrounding territory, while the smaller two move off to find their own territories.⁷

There is little more I can say about these wondrous beings. Perhaps this treatise may serve to guide one more learned than myself in discovering more. I must say that in the time I have spent studying the galeb duhr, I have grown to respect and like them. Bold adventurers who plan expeditions to the mountains may run across these creatures, and I strongly advise friendliness and courtesy when dealing with them. To their friends, they are most benevolent and helpful; those who make them enemies will find the galeb duhr have hearts of stone.

Footnotes

Galeb duhr are described in the AD&D® 2nd Edition *Monstrous Compendium*, volume 2, and in the AD&D 1st Edition *Monster Manual II*, page 68.

1. Galeb duhr have no need for oxygen or any other inhaled gas for survival. Accordingly, they suffer no damage from harmful gases (poison gas, **cloudkills**, green dragon breath, etc.) or immersion in any liquid except acid.

2. If a galeb duhr is removed by any means from its natural surroundings, its physical condition will slowly begin to deteriorate, as the life-giving connection to the elemental plane of Earth slowly fades. In areas where they are not totally cut off from their mountain origins, such as plains or farmland, this deterioration will be slow: the galeb duhr will lose 1 hp per day that it is away from its home. Such loss is permanent until it returns to an area that is predominantly rock and stone, at which time it recovers lost hit points at a rate of 2-5 hp per day. In an area totally removed from its ordinary habitat, such as a desert or an ocean, a galeb duhr will lose 2-5 hp per day, but will regain them at the above rate if returned to its home.

When a galeb duhr falls below 20 hp due to loss of contact with its natural habitat, it loses its powers to control stone. Such powers return at once upon renewed contact with a rocky or mountainous environment. Should a galeb duhr fall to zero hit points due to environmental deprivation, the connection with the elemental plane of Earth is considered to have vanished completely, and it becomes nothing more than a normal boulder. A full **wish** is required to revive a galeb duhr

from this state.

3. See the AD&D® 2nd Edition *Dungeon Master's Guide*, page 64, "Innate Abilities," for details on how a galeb duhr's "spell-casting" powers really work.

For every 500 years over 2,000 that a galeb duhr has lived in its own territory, it gains one of the following advantages. This reflects the galeb duhr's ever-strengthening connection with its territorial surroundings and the plane of Earth. In areas where the natural elemental influence has been heightened, galeb duhr may obtain these additional powers more quickly; this is left to the DM's discretion. DMs may choose powers or roll them randomly; if duplicate powers are obtained on rolls of 13-20, roll again.

1d100	Benefit
1-4	+2 AC bonus
5-8	Resist magical fire
9-12	+2 HD bonus
13-16	Resist cold
17-18	Stone tell
19	Stone barrier
20	Double boulders

Explanation of powers

+2 AC bonus: The galeb duhr's armor class is modified from -2 to -4 initially and may improve further on subsequent rolls to AC -10.

Resist magical fire: The galeb duhr still has a +4 bonus vs. fire attacks. However, the galeb duhr takes -1 hp per die of damage done. Further bonuses of this sort reduce damage down to a minimum of -4 hp per hit die.

+2 HD bonus: For each hit die the galeb duhr possesses, it gains an additional 2 hp, to a maximum of 8 hp per die on subsequent rolls.

Resist cold: Galeb duhr who possess this power may move and function in even the coldest weather. They save normally against cold-based attacks and take only normal damage from them.

Stone tell: This power is identical to the priest spell **stone tell**. It is performed at the 20th level of ability.

Stone barrier: This is a new priest spell, described here. Galeb duhr perform it at the 20th level of ability.

Stone barrier (Alteration)

Level: 6 Components: V,S
Range: 30 yards CT: 5
Duration: 3 rnds. +1 rnd./2 lvls. of caster
AE: Special Save: Special

Upon casting this spell, the spell-caster sets a whirling wall of flying stones in motion about a fixed point. Any creature attempting to pass through this barrier will take 8d8 hp damage (when used by galeb duhr, add 1 hp for each hit die the galeb duhr possesses: 8d8 + 8-10 hp). In respect to area of effect and in all other aspects, noting the changes given here, this spell conforms to the sixth-level priest spell **blade barrier**.

Double boulders: When the galeb duhr *animates* normal boulders to fight for it, 2-4 are *animated* (as opposed to the normal 1-2).

4. Galeb duhr ordinarily are very sluggish after more than three days of sub-freezing temperatures. They are hard to rouse in such times and act as though under the influence of a slow spell when active at all. Those who are resistant to cold (see note #3) may move and act normally.

5. The following effects of wizard and priest spells should be noted when such spells are used against galeb duhr: *Animate rock*, if it can affect a stone the size of the galeb duhr, effectively *charms* the galeb duhr (who receives no saving throw) and causes it to obey the caster's every command; however, the galeb duhr greatly resents such treatment and always attacks the spell-caster after the spells duration ceases. *Dig, move earth, passwall, sink, spike stones, stone shape*, and *transmute rock to mud* (and its reverse) have no effect if cast upon a galeb duhr. *Earthquake*, if cast directly at the galeb duhr, causes death and shattering if a saving throw vs. death magic is failed, or 3-30 hp damage otherwise. *Stone tell* forces the galeb duhr, with no saving throw, to confront the spell-caster and truthfully answer all questions for the spells duration; once the spell ends, the galeb duhr is

certain to leave at once, though it might attack the spell-caster if the latter was rude. *Stone to flesh* causes the galeb duhr's body to become fleshy (AC 8) if it fails a saving throw vs. spells, a condition that distresses it greatly and causes it to lose all of its spell-like powers; *flesh to stone* reverses this effect. Always consider the galeb duhr's 20% magic resistance when figuring spell effects.

6. The stony body of a galeb duhr always matches the predominant stone of the area. Granitelike stone is most common, but marble, quartz, and all other igneous or metamorphic types are possible. No galeb duhr have bodies matching sedimentary rock, such as shale, sandstone, or limestone.

A fragment of a galeb duhr's body, if it can be identified as such, is of special value to spell-casters. Any earth- or stone-related spell requiring a piece of stone as a material component will be half again as effective if the stone used comes from a galeb duhr. Fragments retain this magic-boosting property for one month after their creation, after which they become like normal stone in all respects. Fragments used in spell-casting will always be consumed, even if the spell does not ordinarily destroy the material components. There is no way to prevent this consumption or to cause a fragment to retain its enhancing power for more than one

month.

7. Of the three galeb duhr produced, there will be one of each size category: one 10 HD, one 9 HD, and one 8 HD. The 10 HD galeb duhr will instinctively move to take over the immediate territory. The smaller ones usually move off to stake out their own areas, though they sometimes remain (15% chance) and share the area between the three of them. In such cases, the largest does not rule the others, and they take little note of each other in day-to-day activities, though they do not hesitate to aid one another in a crisis. Ω

Each set has a matching Tens10' Die for % rolls.

Percentile Rolls: By using a D10 with a Tens10' you can easily generate numbers from 00-99 with never a doubt! 800/77.

And Now With the New CHESSEX D4!

Chapter Three

GARGOYLE

"I WAS WALKING THROUGH THE SCULPTURE GARDEN ON MY ROUNDS LATE ONE NIGHT, WATCHING FOR ANYTHING UNUSUAL, JUST LIKE ANY OTHER SHIFT. BUT I HAD THE QUEEREST FEELING THAT NIGHT THAT SOME OF THE STATUES WERE WATCHING ME. I LOOKED REAL HARD AT ONE OF THEM, KIND OF A WINGED, BLINDFOLDED ANGEL, BUT IT WAS JUST A STATUE. I RUBBED MY EYES, THINKING I WAS GOING CRAZY, AND WHEN I OPENED 'EM AGAIN, I SWEAR THAT STATUE HAD MOVED. I TURNED AROUND AND WALKED AS QUICK AS I COULD BACK TOWARD THE GATE, BUT I THOUGHT I HEARD A NOISE, SO I WHIRLED AROUND. THE STATUE WAS RIGHT BEHIND ME! I WALKED BACKWARD ALL THE WAY TO THE GATE, NEVER LETTING THAT THING OUT OF MY SIGHT. I AIN'T BEEN BACK SINCE."

—HAVRED ALOCIOUS, RETIRED NIGHT WATCHMAN AT THE
STATUE GARDEN OF PORTHMOS, OPPARA

Sinister hunters of living stone, gargoyles perch high on the rooftops of towns and cities, appearing for all the world like harmless stone sculptures, carved in the likeness of demons, devils, or other hideous humanoid creatures. As still as statues, they patiently wait through the daylight hours, watching the city come to life and hungrily eyeing the unwitting passersby below. When dusk falls, the statues come alive and fly into the night sky, silently soaring above the darkened streets on stony wings looking for prey, snatching up unsuspecting walkers, never to be seen again.

Those “civilized” races that make their homes in cities foolishly think their stone walls and patrolling guards protect them from the dangers of the wild, often not realizing that vicious natural predators lurk above their heads every day, and these urban inhabitants are the gargoyles’ favored prey. In such a city, the gargoyles are the top of the food chain, not the unsuspecting humans and other residents. When dawn finally breaks, the handiwork of these nocturnal hunters can be discovered: an unidentified mutilated body in an alleyway, the corpse of a suicide who apparently jumped from the bell tower, and all the people that never came home the night before, whose disappearances are never explained. Wise city dwellers simply nod knowingly and make sure their chimneys are blocked, their shutters closed tight for the night.

Gargoyles are not restricted solely to urban environments, however. They can be found almost anywhere, though they prefer hills, mountains, and rocky badlands where they can use their natural camouflage to great effect. So-called “wild” gargoyles do not have the sculptured appearance of their urban brethren; their bodies are rougher and more jagged, more akin to natural rock. They do not limit their activities to the night, either. Away from the trappings of civilization, wild gargoyles have little fear of organized reprisals, and so hunt whenever the mood strikes them, or whenever choice prey appears. Some half-bury themselves in the earth, sand, or snow to pretend to be mysterious statues.

Wild gargoyles tend to prey on isolated travelers, though a wing of gargoyles will attack a caravan if it doesn’t look too heavily guarded. Food is not the object of such hunts, but rather the thrill of the chase, so most local wildlife is safe from the gargoyles’ depredations. A gargoyle will harry and toy with a lone traveler for hours, first appearing high above, then reappearing again and again, closer each time, to heighten the fear of its chosen prey. As the traveler becomes more panicked and seeks to escape his pursuer, the gargoyle swoops in to claim its prize. Such travelers usually fail to reach their destinations and are never heard from again, their fates unknown. Most often, the gargoyle kills its prey at the conclusion of a hunt, dropping it from a great height onto sharp rocks below, but occasionally a gargoyle will take a prisoner back to its lair to torture and abuse until the poor victim finally dies. Few travelers marked as prey by wild gargoyles ever escape to tell the tale.

ECOLOGY

When unmoving, a gargoyle appears to be nothing more than a lifeless, winged stone statue, albeit one with a fearsome demonic appearance. Gargoyles can hold themselves perfectly still, and only the keenest observers may notice something is amiss before the statue suddenly explodes into life in a frenzy of knife-edged claws, gnashing teeth, and cruelly pointed horns. Gargoyles are humanoid, standing about 6 feet tall with a wingspan of 15 feet, and their dense stone bodies weigh upward of 1,200 pounds.

Gargoyles have only the most rudimentary bodily systems; they can go a month between meals, and can hibernate for years when food is scarce, leading some to believe they do not eat at all. They are incredibly resistant to damage—attacking one is like hacking a solid stone statue, and only magical weapons prove effective at piercing their stony skin. Over time, however, a gargoyle’s skin does gradually erode from exposure to the elements. Young gargoyles appear newly carved, while the eldest among them are weathered and pitted, traced with cracks, and often sporting growths of moss or lichen as well.

Although they rarely need to eat, gargoyles enjoy inflicting pain on other beings, and seem to take a perverse pleasure, if not actual sustenance, from the screams and whimpers of their prey. Because of this predilection, gargoyles focus their hunts on humans and other intelligent beings, and usually disdain lesser animals. They revel in the torture of helpless prey, and gargoyles have been known to feed upon fallen foes while they are still alive, grinning toothily and swaying in ecstasy to the victim’s horrified screams.

Gargoyles mate whenever the fancy strikes them, in short, violent aerial clashes that seem more brawl than breeding ritual. They choose partners seemingly at random, with the strong often subduing the weak, and have nothing to do with one another afterward. A female gargoyle lays a clutch of 1–4 stony eggs in a secluded place such as a cleft in a cliff face or the lee of a chimney, then abandons the eggs to their fate. A month later, the eggs hatch, although the first hatchling may succumb to a cruel urge to break the eggs of its clutch-mates before they can hatch, leaving it the sole survivor. A gargoyle reaches full maturity in only 1 year.

Gargoyles can live for hundreds, perhaps thousands of years, though their exact lifespan remains a mystery. They do not grow weaker with age, but their stone bodies do become more brittle and subject to accidental breakage as time passes. It has been theorized that a gargoyle can live as long as its stone body can endure, giving it a lifespan of geologic scale, but few gargoyles ever last to such an advanced age. Most fall prey to stronger hunters, accidents, or their own internal feuds long before.

Over time, gargoyles begin to take on the appearance of their environment. The longer they stay in one place, the more they come to resemble the architectural styles or natural features of their surroundings. A tribe of gargoyles

GARGOYLE GAMES

Gargoyles are cruel and look down upon “weak” creatures that cannot fly and have to regularly eat to survive. Though slow of wit, they are remarkably cunning at finding ways to harass and torture other creatures for sport. A bored gargoyle might single out a small farm and spend an entire night pulling up all the crops in the farmer’s field just to see his reaction at dawn. Then it might steal his chickens one by one, breaking their wings and letting them plummet to their deaths onto his roof. From there it might kill the larger animals, then the farmer’s wife and children, and finally the farmer, dropping him over and over in a remote area until his legs are broken and he starves to death. A city gargoyle may follow a particular night watchman every night, making moonlight shadows and strange noises, dropping pebbles on him, swooping down to clutch at his cloak, and so on, until the man is completely terrified. Few gargoyles have the patience to do this for more than a few days, but those who do gain a reputation as vile as most demons.

GARGOYLE TROPHIES

Driven by their obsessive natures, gargoyles amass a variety of trophies with which to decorate their lairs and boast of their kills. In most cases these trophies have little value, though some prefer jewelry or other trinkets, and a rare few collect magic items.

Use the following table to randomly determine what sort of mementos a gargoyle collects and displays in its territory.

d20	Trophy
1	Books or scrolls
2	Shoes
3	Buttons
4	Rings
5	Brooches or clasps
6	Pieces of armor
7	Scalps
8	Ears
9	Teeth
10	Skulls
11	Bones
12	Fingers
13	Skins or pieces of skin
14	Weapons
15	Necklaces or bracelets
16	Coins
17	Belts
18	Pouches
19	Strips of cloth
20	Minor magic items

inhabiting a vibrant city will eventually look similar to the style of statues prevalent there, while those dwelling in the lava fields below a volcano gradually take on a jagged, ashen appearance. Such adaptations are slow and subtle, but over the span of many years, a gargoyle’s appearance can change dramatically depending on its surroundings.

An old Varisian tale says that gargoyles were once a tribe of cowardly hillmen, creatures of soft flesh and weak hearts. Their tribe’s shamans made a pact with the demon Xoveron, gaining the ability to transform their warriors into living stone—in exchange for their souls. Emboldened by their near-invincibility, they raided other tribes for food and treasures, but the more they used this ability, the harder it was for the warriors to resume their normal forms. When these warriors fathered children, they were born demonic and stone-gray, hardening after a few hours to unfeeling rock, and the entire tribe turned on the shamans for dooming their children to ugliness. Within a generation, the entire tribe had become flint-skinned monsters. Petty rivalries escalated into open warfare between families, and the survivors scattered to the four winds, becoming all the kinds of gargoyles known to the world.

Some legends say that one night a year, perhaps late in Lamashan or early Neth, the gargoyles can walk as humans, temporarily freed of their ancient curse, mingling with the people of the cities, perhaps finding love, but becoming hideous monsters once again at the dawn’s first light.

HABITAT & SOCIETY

Gargoyles can live anywhere, but prefer rocky areas or subterranean caverns with ample hiding places for ambushes, as well as crumbling ruins and large cities with plenty of stone construction. One variety of gargoyle, the kapoacanth, has even adapted to aquatic life, dwelling in shallow coastal areas or sunken, ruined cities. Gargoyles can be loosely divided into two main groups, urban and wild, depending upon their chosen habitat.

Urban gargoyles usually live alone, but young hunting pairs are not uncommon. Sometimes larger numbers of urban gargoyles band together in short-lived wings, usually for sport or, in the case of organized resistance, for mutual protection. Wild gargoyles tend to lead solitary lives as well; larger tribes of wild gargoyles do exist, but these are unstable gatherings at best. Gargoyles are petty, spiteful, and perfidious creatures, and individuals feud and squabble with one another constantly. Tribal membership changes frequently as individuals are driven out, killed, or leave of their own volition, while new members join or smaller wings and tribes are conquered and assimilated. There is no division based on gender, only on strength—males and females hunt and kill equally, and the strong of either sex dominate the weak.

The leadership of such tribes is always hotly contested, and no warlord or tribal chieftain lasts long if he is unable

to defend his rule from younger rivals eager to prove their strength and prowess. Challenges for leadership are common, and most often take the form of boasting duels. Gargoyles love to brag about themselves, and the challenger who can boast of the most conquests, the most interesting kills, and the most cunning and long-lasting tortures usually wins by acclaim. In cases where there is no clear winner, the challengers must prove their worth in the Ritual of the Thousand Pains. The entire tribe gathers in two facing lines, and the competitors must fly the gauntlet as their tribe-mates slash at them with sharpened claws. If a contender falters, even for a moment, the tribe falls upon it and rips it to shreds. The victor emerges at the end of line, torn and tattered, scarred for life, but with the bragging rights to claim rulership.

Gargoyles are notoriously obsessive, and avid collectors of trinkets and trophies, both as proof of their boasts and as decoration for their bodies and lairs. They do this less for material wealth than as a way to distinguish themselves from others in their tribe. One gargoyle might collect scalps claimed from her fallen foes, while another wears the coins of his kills strung together in belts and necklaces. Still another might proudly display the weapons of her defeated opponents.

Most gargoyles worship Xoveron, the Horned Prince, demon lord of gargoyles and ruins. Gargoyle religion is far from organized, and while larger tribes might have an adept or two, they are seldom treated any differently from their peers and have no special status or influence among their fellows. The rare four-armed gargoyles, however, are considered blessed by Xoveron, and are frequently paid great respect and given positions of power, at least as long as their actions match their boasts.

CAMPAIGN ROLE

Gargoyles function as superb aerial predators and ambush hunters. Any rooftop, ruin, cliff face, or statue garden can hold a gargoyle silently and patiently waiting to attack unwary PCs. Gargoyles can also serve as excellent guards for an enemy's fortress or villain's lair—with little need for food or water and the ability to blend seamlessly into its surroundings, a gargoyle guard can wait endlessly for intruders.

Gargoyles are perhaps most easily used in urban or ruined settings. Their ability to appear as harmless statues provides excellent cover for their vicious activities. But beyond their role as solitary hunters, gargoyles can also be used to add a bit of

mystery to a campaign. A series of unexplained disappearances or murders can eventually lead back to a gargoyle serial killer who soars the rooftops by night but perches quietly on a church steeple during the day.

Outside of cities, wings of tribal gargoyles can rampage through the wilds, attacking travelers and merchant caravans or even isolated homesteads and villages. The PCs might be hired as guards for a caravan venturing into known gargoyle territory, or be tasked with protecting a village from a gargoyle raiding party. In these situations, the gargoyles' aerial abilities and damage reduction can prove quite a challenge, especially for lower-level groups.

VARIANT GARGOYLES

In addition to the aquatic kapoacanth, several other varieties of gargoyle exist that have adapted to their surroundings.

Arctic Gargoyle: In cold, northern climes, some gargoyles have adapted to hunt the icy glaciers and snowfields.

The skin of arctic gargoyles looks like weathered rock with scattered white patches that helps them hide among the snowy mountains. They gain a +6 racial modifier on Stealth checks made in stony or snowy environs and have cold resistance 5. (CR +0)

Forest Gargoyle: These strange gargoyles prefer the tall trees of forests and jungles to the rocky spires of mountains. Their skin has the appearance of bark, granting them a +6 racial modifier on Stealth checks in wooded areas (this replaces the normal gargoyle's modifier in stony areas). Forest gargoyles lose the normal gargoyle's freeze ability, but gain the following spell-like ability: 3/day—*warp wood*. (CR +0)

Gemstone Gargoyle: Rarely, an individual gargoyle is born with skin with the luster and appearance of a valuable gemstone. Amethyst, opal, sapphire, and topaz are most common, but legends also tell of diamond, emerald, and ruby gargoyles. Gemstone gargoyles are usually smarter and stronger than other gargoyles, and often rise to positions of leadership within tribes or wings. Gemstone gargoyles have the advanced creature template and usually have class levels, typically in barbarian or fighter. They have DR 10/adamantine (instead of the normal gargoyle DR), SR 14, and resistance 10 to acid, cold, electricity, or fire. (CR +1 plus advanced creature template and class levels)

Obsidian Gargoyle: Creatures at home in the searing heat of volcanoes and lava fields, obsidian gargoyles have the dark, glassy appearance of polished obsidian. The razor-sharp edges of their claws and teeth increase the damage of their natural attacks by one step, and anyone attacking an obsidian gargoyle

FACETS OF FEAR

Among the monuments of a city, statues stare blankly at nothing, devoid of intellect and feeling, as cold, uncaring, and lifeless as the walls of the city's man-made canyons. But sometimes the walls seem to have eyes, and in the play of shadows, statues can appear to move with dark intent. Gargoyles embody this fear, the terror that comes when night falls and the city itself seems to come alive, to purge itself of the living vermin who populate its streets.

Urbanization can have a dehumanizing and isolating effect as well, where one feels alone in a crowd of thousands. Among such teeming multitudes, a person could disappear without a trace and no one would notice his absence. Humans and other intelligent races pride themselves on their "civilization," their ability to tame and impose order on nature. Behind their walls, in their cities of wood and stone, they feel safe, with all the terrors of the wilderness locked safely outside. But lying just below the surface is always the fear that maybe they are *not* safe, that perhaps civilization is just a facade, and that danger can lurk in the eaves of buildings just as easily as among the branches of the forest. In urban environments, gargoyles are apex predators, swooping out of the night sky on soundless wings to snatch unsuspecting residents, who quickly learn they may be prey as well as predator. And when such poor unfortunates are taken, will anyone hear their screams? Will anyone care?

with unarmed or natural attacks takes 1d4 points of damage from the gargoyle's jagged glass spikes. Obsidian gargoyles also have fire resistance 10. (CR +0)

Sandstone Gargoyle: Sandstone gargoyles inhabit wide beaches and deserts, or anywhere with a large amount of sand or loose dirt. They have a rough, granulated appearance, and small bits of debris constantly fall from their bodies. Sandstone gargoyles have a burrow speed of 10 feet, though only through sand or loose soil. They can also bury themselves in sand, erupting forth to attack with surprise. This counts as a charge, except the gargoyle can only move its speed (not twice its speed). (CR +0)

Waterspout Gargoyle: These creatures have adapted to life in a magical city, and may be the descendents of a wizard's team of modified gargoyle guards and spies. They can cling to buildings with ease and have a climb speed of 20 feet. Waterspout gargoyles have a breath weapon in the form of a stream of high-velocity water 20 feet long and 1 foot wide which expels about 30 gallons of water. The force of this geyser deals 1d4 points of damage to a single target and the gargoyle can use this ability to trip or bull rush the target as a free action (if the attempt fails, the gargoyle cannot be tripped or bull rushed in return). The breath weapon is usable every 1d4

rounds and is a supernatural ability. In addition, particularly daring gargoyles can reduce their stream to a trickle in order to pass themselves off as ornamental fountains. (CR +0)

KNOWN GARGOYLES

The following are a few particularly infamous gargoyles.

The Blind Angels: This wing of gargoyles inhabits the famed Statue Garden of Porthmos in Oppara's Memorial Park. Unlike their normal kin, these gargoyles look like blindfolded angelic statues with feathered wings rather than the more usual bat-winged demons. Even stranger, the Blind Angels seem to suffer from a curse that freezes them involuntarily when viewed directly. Alone or in total darkness, they can move freely, but as long as someone is looking at them, they are frozen in statue form, unable to move. This curse has made them masters of stealth and ambush, as they can only attack unseen. Although many stories circulate through Oppara about statues that come to life and kill when one's back is turned, most Opparans believe these to be mere myths, even in the face of several unexplained disappearances in the Statue Garden.

Xiveraka and the Twisted Horns: This scarred priestess of Xoveron leads a tribe of wild gargoyles that roam the blasted wastelands of the Worldwound. Warped and tainted by the Worldwound's abyssal energies, the Twisted Horns regularly raid the few remaining settlements of lost Sarkoris that cling to life on the Worldwound's southwestern frontier, and even fly occasional sorties against the crusaders of Mendev as well. The tribe sometimes allies itself with one demonic warlord or another, but such partnerships are short-lived, as Xiveraka constantly breaks alliances to lead the Twisted Horns on her own mysterious vision quests that she claims to receive from the Horned Prince himself.

SAMPLE GARGOYLE

This solitary gargoyle hunter prowls the rooftops and skies of Magnimar's Underbridge district, where the shadow of the Irespan allows him to hunt his victims in the safety of darkness at almost any hour of the day. While Underbridge is his primary hunting ground, Ajekrith does sometimes venture out from under the Shadow, especially when bored of his usual prey. At these times, Ajekrith usually stalks the rooftops of Lowcleft and Dockway, preying upon lone late-night revelers. He rarely visits the districts atop the Summit, except for occasional forays into the Alabaster and Marble districts to wander among the statue-lined streets.

The frightened vagabonds, vagrants, and other slum-dwellers that he hunts don't know who or what he is, but they know that *something* snatches lone victims from the deserted streets and alleyways, and have come to call it "the Nightwing Snatcher," an epithet Ajekrith privately enjoys.

Ajekrith likes to toy with his prey, and those unfortunate enough to survive his initial attacks are often brought back

to his lair where he can torture them at his leisure. One of his favorite pastimes is to drop a live and conscious victim from the heights of the Irespan or the Arvensoar, relishing the unfortunate's screams as they fall to the rocks below.

Ajekrith roosts on the top floor of a dilapidated, condemned tower near one of the Irespan's immense pylons. Flight provides the only access to his nest, as all of the tower's interior staircases have collapsed. Inside, his lair is bedecked with strips of dried skin torn with perverse care from his victims, dangling from ropes like drying laundry. When not out hunting, Ajekrith can usually be found here fondling these grisly trophies, speaking to them in guttural whispers as he brags of his most recent kills.

AJEKRITH, THE NIGHTWING SNATCHER CR 8

XP 4,800

Male gargoyle rogue 4
